The AEROPLANE

The Editorial and Advertising Offices of "The Aeroplane" are at 166, Piccadilly, London, W.1.
Telegraphic Address: "Aileron, London." Telephone: Mayfair, 5407.
Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Rolls House, Breams Buildings, E.C.4.

Subscription Rates, post free: Home, 3 months, 3s. 10d. 6 months, 7s. 7d.; 12 months, 15s. 2d.
Abroad, 3 months, 4s. 4d.; 6 months, 8s. 8d.; 12 months, 17s. 4d.

ON AERIAL WAR.

21918
A32 AER

Something like a year ago a famous member of the Royal Aero Club remarked casually to a room full of other members that there was one man to whom this country should put up a statue in commemoration of his services to British Aeronautics. He added that he would give everyone in the room two guesses as to the person's name, and that he would bet none of them would guess right, and that when he mentioned the name everyone would agree with him. Pretty well everyone had a guess or two. One suggested General Henderson as having laid the foundations of the R.F.C. Another suggested Mr. Frank McClean because he made it possible for the beginnings of the R.N.A.S. to learn to fly by supplying them with aeroplanes and an aerodrome free of charge. Another suggested Mr. G. B. Cockburn because he taught these same officers to fly. Various other suggestions were made.

Then the originator of the argument made the plain statement that the person who most deserved a grateful memorial was Count von Zeppelin, because he had done more than any one man to awaken the British people to this country's need for an Air Fleet. And the funny part of the incident was that everyone agreed with him.

In a similar way one could doubtless find many to agree that Captain Brandenburg, of the German Feldfliegertruppen, deserves some signal mark of recognition from this country for convincing so many thousands of people that an aerial invasion of enemy territory must be an important part of our war policy in this or any future war.

The British Public was not convinced by Lord Roberts, and British Officialdom was not convinced by Lord Haldane, as to the needs for raising a Citizen Army many millions strong. But both were finally convinced by General von Hindenburg, even before he became a Marshal. The peoples of the British Empire were not convinced as to the usefulness of Imperial Unity by all our oratorical advocates of Imperialism, but they believed quickly enough when the German Emperor showed them what United Germany could do. And so on all the way down the scale, through Grand-Admiral von Tirpitz and his submarines, Germany's heavy artillery commanders, her machine-gun organisers, and everything else. All of which goes to prove once more the truth of the oft-quoted Irish proverb that if you want to put life into an Englishman you have to scare him to death.

When we have done with this war and have as a result the most solid Empire, the finest Army, and the biggest and best Air Fleet in the world, we might do worse than remove those idiotic Landseer lions from Nelson's Pillar and put in their stead statues of the German Emperor who found our Imperial soul for us, of Marshal von Hindenburg who forced us to raise an Army worthy of our position in the world, of Count von Zeppelin who awoke us to the need for an Air Fleet, and of Captain Brandenburg who showed us how it should be used.

I leave the Navy out of the question, because ships will not be worth much in the next war, thanks to armour-piercing bombs and depth-charges; but if anyone is anxious to do so, they can sit a statue of Grand-Admiral von Tirpitz in one of the fountains behind Nelson, where he can keep an eye on the Admiralty and remind it of what Daddy did *not* do in the Great War.

Anyhow, thanks to the late Count von Zeppelin and the very-much-alive-at-the-time-of-writing Captain Brandenburg, we seem at long last to be awaking to the possibilities of aerial war, and, though it may mean reorganising the whole of both Flying Services to do it, I believe we shall be carrying on an air war properly before we have finished with the land war—even if some military genius takes hold of the "tank" idea and uses these weapons as they ought to be used, instead of merely playing with them in much the same way as we played with aircraft for the first year or more of the war.

Steps Forward.

When someone in authority realises that organised bomb attacks with big machines are a serious branch of artillery work, and that "tip and run" air raids with little machines are not, we shall have made one step forward.

When it is recognised that blowing up an ammunition dump in the war area only means more work and wages in Germany, and that blowing up a munition factory destroys still more ammunition and at the same time causes idleness and distress in Germany, we shall have made a step farther forward.

And when we start in earnest to destroy Germany's ammunition supplies at their source instead of waiting till they are moved up into the war area, where they are partly used against our troops before we can destroy them, then we shall have begun to carry on air war in earnest, and our whole Army will be able to take several steps forward.

So long as the British Expeditionary Force has all the reconnaissance and photography and gun-spotting machines it wants, and all the fighting machines it needs to protect them, it can do without bombing machines. Long-range guns can cut railway lines fifteen miles or more behind the fighting line, and can keep them cut, more accurately and more easily and more cheaply than can aeroplanes with bombs. And the bombing machines can do more damage, with greater certainty of hitting their marks, by sticking consistently to hammering German munition areas.

Moreover, organised and constant bomb raids over their munition areas will force the Germans to deplete

497668

their supply of fighting machines in France, much to the advantage of our reconnaissance machines and gun-spotters. And a properly designed bombing aeroplane is quite capable of protecting itself against fighting machines, so that no great force of fighters need be told off to protect the bombers.

It is necessary to remember, also, that even if the whole length of Belgium be taken into consideration, our aerodromes in Flanders are nearer to Germany than the German aerodromes are to any important munition area in England. Furthermore, it is possible by consistent bombing of German aerodromes in Belgium to force the German bombers to move their starting-places farther and farther East, until ultimately it is impossible for them to reach England at all.

A MATTER OF ORGANISATION.

The carrying of such aerial war to a successful issue is purely a matter of organisation. There are half a dozen men in the Flying Services, whom I could name offhand, who are perfectly capable of organising the whole business if turned onto it, relieved of all other responsibilities and adequately supplied by the Air Board with matériel. Doubtless it sounds a fairly tall order, but it is not half such a difficult job as many other things which are now done as a matter of course, though when they were demanded a year or two years ago we were then told they were impossible. It is nothing like so difficult, for example, as clearing up the Mesopotamia muddle, or withdrawing from Gallipoli, or building railways in France, or producing harmony at the Hotel Cecil.

Born organisers are not so difficult to find, without going outside the Flying Services. The real difficulty seems to be the finding of the men in high places who are capable of finding the said organisers and giving them the necessary power to do their work without interference by jealous or incompetent seniors—as has been proved in Mesopotamia.

ATTENTION AT LAST.

Anyhow, the whole question of aerial war is now receiving some of the attention which its importance deserves, and the debate in the House of Lords on June 26th shows that it is being taken seriously. The account published hereafter is taken from the "Times" newspaper, as Hansard reports of debates in the Upper House do not appear as rapidly as do those of the debates of Commoners, owing to the Peerage preferring to edit its own speeches into a semblance of accuracy. One takes the liberty of interpolating comments on their Lordships' speeches as has been the custom of this paper in debates in the Commons. The "Times" report reads as follows:—

AIR RAIDS AND REPRISALS.

Lord Strachie asked the Secretary of State for War (1) whether he would consider the necessity of creating a separate department for the aerial defence of London and placing it under the absolute control of experts; (2) whether it was a fact that arrangements for signalling the approach of hostile aircraft were wholly or in large measure directed by a retired superintendent of Indian Police, with temporary naval rank; (3) whether the Secretary of State for War would direct that the sky above east, north-east, and south-east London should be regularly patrolled by aircraft in relays of two hours' duration; (4) whether, inasmuch as effective and immediate reprisals were a certain means of preventing enemy raids, and therefore preserving British life and property, it would not be advisable to order that every enemy raid which proved injurious to the civilian population of this country should be followed by one on a far larger scale, directed against some German town within reach of the Anglo-French lines. He understood that there were six departments concerned with the air defences of London, and it was feared that there was some friction between them. As to aircraft reprisals, if they were carried out on German towns he believed they would be effective, and would bring the realities of war home to the German population, who as yet had suffered but little from it, except in so far as we had cut off food supplies.

[Such an arrangement as Lord Strachie's first question suggests is unthinkable. It would mean creating a London Defence Army with a separate force of aeroplanes, anti-aircraft guns, observation posts, and everything else, apart from Home Forces Command. It would overlap all the provincial defence arrangements, and would cause endless friction and confusion. His second question appears to be merely foolish, because the signalling of hostile aircraft has nothing to do with the Navy, above high-water mark; and, anyhow, there seems no reason why a retired Indian Police officer should not be an excellent man for the work.

The third suggestion, as to continual patrols, is simply futile. No possible patrol could attack an invading force, and the actual defensive aeroplanes would have to start from the ground as usual. Consequently, patrols would merely use up men and machines and petrol to no purpose. The fourth suggestion shows glimmerings of sense; but, like so many other people, Lord Strachie insists on regarding as reprisals those warlike operations which ought to be merely part of the regular work of the Flying Services.]

Lord Sydenham said that there were three matters to which, in his opinion, the Government ought to give careful consideration. The first was the best possible distribution of our Air Forces in this country having regard to the new conditions that had arisen. The second matter was that the conditions prevailing at the Air Stations should be such that every effective machine would be ready to go up at a moment's notice; and that there should be competent authorities always on the spot to give orders for the machines to ascend. Lastly, there should be a carefully organised observation system with centres from which warnings could be distributed to Air Stations and gun stations.

A difference of opinion prevailed about the giving of warnings to the civil population. Anyone who was in the City at the last raid, as he was, could not help observing that there was a general tendency on the part of the public to go out into the streets or upon the roofs in order to see what was happening. In some offices, however, the staffs were directed to go down to the basements. Everyone should have the chance of doing that. It seemed to him that it should have been possible to give at least half-an-hour's warning of the raid, even after the direction of the enemy aeroplanes was determined.

He was against reprisals in kind, and thought that if they were avoided our descendants would be thankful that we had not lowered ourselves to the level of the Germans. (Hear, hear.) Besides, reprisals in kind would involve a considerable limitation to the proper and more effective work of our aviators at the front. If the public were better informed by the Government as to the result of these tactics they would be more satisfied, and their erroneous conclusion that while the Germans were attacking us we were doing nothing would be removed.

[As always, Lord Sydenham's observations deserve careful consideration. Very probably by now the "best possible distribution of our air forces in this country" has been made, or is in the making. As to having machines ready to go up at a moment's notice, it may be remembered that a year or so ago it was pointed out in this paper that defensive aeroplanes should take no longer to start than it takes to turn out a fire-engine. Whether machines do turn out so quickly or not depends on the officer commanding each station. I happen to know personally of at least one station which on the occasion of a recent warning had its fighting machines actually in the air in time which would have done credit to a fire station.

Such rapidity means keeping pilots in turn on the spot for a certain period every day. It may be worth while here to point out that each pilot must have his own machine, and must not be allowed to dash out in a fit of enthusiasm and seize the first machine he sees ready to start. He may be depriving a better pilot of the machine to which he is most accustomed, and may thus decrease the fighting value of that particular unit.

As regards the observation system and the distribution of warnings, one hopes that Lord Sydenham has since been shown the working of the system now in operation. As a machine, it appears to be singularly efficient, and its weakness is merely the fallibility of its individual human elements, which can only be discovered in the process of operation, and eradicated when found.

The question of warnings is most difficult, as has been demonstrated frequently of late. It is even doubtful whether it is wise to go down into basements, in view of the result officially notified in the Poplar case, where 26 children were killed on the ground floor, and only one on each of two floors above. It would seem probable that the Germans are now using the equivalent of an armour-piercing shell, with great penetrating power and a delay-action fuse, so that more damage is done on the ground level than upstairs. Where there are many floors above and a heavily vaulted cellar—as in some banks—the cellar might be the best place, but most modern houses have only an ordinary wooden floor over the cellar, and, in such a case, the cellar would be the worst possible refuge. On the whole, it seems that warnings should not be given broadcast, but only to responsible people,

such as the fire brigade and police, so that they may prepare for their special duties, and to heads of big firms, so that they may get fire-extinguishing apparatus ready, and take steps to allay panic among their employees when a raid arrives, as, for example, in preventing women workers from crushing one another to death on staircases and so forth.

On the subject of reprisals generally, one agrees with Lord Sydenham. Where there are so many legitimate targets, such as munition works and their surroundings, within reach, we should do little material harm to the enemy and some moral harm to ourselves by bombing mere country villages or health resorts. The bomb which is alleged to have exploded in a circus full of people, including many women and children, at Freiburg, would have been of more use if it had fallen into a blast furnace or a busy machine-shop.]

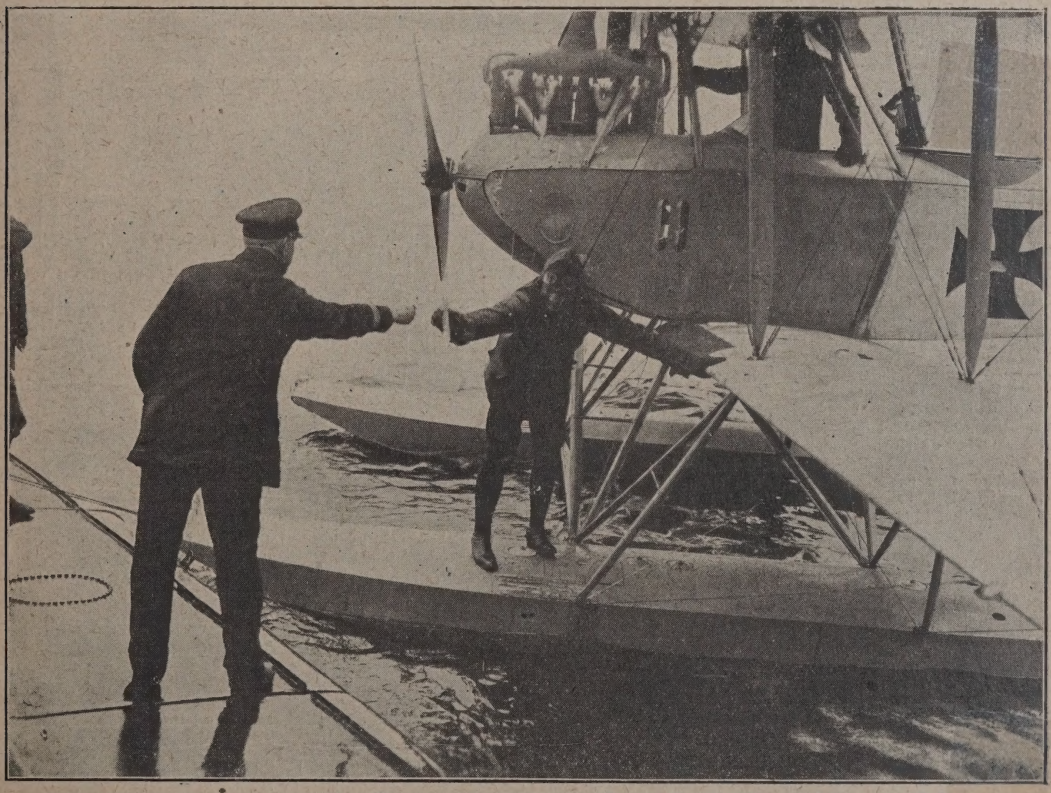
The Marquess of Crewe said he knew something of the observation system established in London and its neighbourhood, and could say that so far as the giving of early warning of impending raids was concerned it had been most successful. In the opinion of the London Fire Brigade the early warning of fires resulting from raids could not be more effectively given by any other system than that which existed at present. It appeared to him to be a mistake to take reprisals in this connection. What ought to be done, and so far as he knew was being done, was to see that our aviators inflicted the utmost possible military damage on the enemy.

[Lord Crewe has evidently familiarised himself with recent developments, and the only question at issue is whether still more military damage cannot be done to the enemy by organising big attacks on his sources of munition supply.]

Lord Knaresborough said he had within the last few weeks made it his special business to inquire of everybody he knew their opinions on this question, he would not call it reprisals, but of hitting back as hard as we could the Germans from the air. He found the general opinion was that the German population inside Germany had been treated like spoilt children during the war. The German population knew this and chuckled, and said we were too silly to treat them as they treated us. He said, Hit back as hard as ever you can. He believed 19 out of every 20 people were of the same opinion.

[Lord Knaresborough's demand that we shall hit back as hard as we can is entirely reasonable, provided that we hit efficiently and in the right spot. It is no use hitting a nigger's head, but one can do good trade by hacking his shins. Similarly, hitting the heart of Germany's army—its sources of supply—is probably better than merely hammering the firing line.]

The Case of the Hospitals.



Viscount Knutsford insisted on the importance of warnings being given of the approach of air raids in the interests of the London hospitals. In those institutions there was an enormous amount of work to be done when these air raids took place. When a hospital dealing with 80 persons brought in every hour suddenly found it had to deal with 270 cases arriving in half an hour it was quite impossible to attend to the wounded unless those at the head of affairs gave them sufficient warning.

Having witnessed the most awful sights he had ever seen in his life, he should like to feel sure that London was as well protected as it ought to be. With regard to reprisals, however, he did not believe that any man who had seen women and children injured and torn to pieces, as he had, would ever dare to say that England should be guilty of such a crime. (Cheers.)

[The point about warning the hospitals is well worth attention, and arrangements have now probably been made to this end. As to the protection of London, it is really no more important that London should be protected than that Folkestone, or Southend, or Billericay, or the Isle of Dogs should be protected. It is England, as a whole, which needs protection. The place where the protection of England should take place is in Germany. The British Army is in France on its way to Germany for that purpose, and a properly organised Air Fleet can get there before the Army.]

The Reply of the Government.

The Earl of Derby, dealing first with the specific questions of Lord Strachie, said:—The answer to the first question is in the negative. The defence of London against aircraft is and must be part and parcel of the defence of the kingdom as a whole. (Hear, hear.) It is under the direction of Field-Marshal Lord French, in whom the Government have every confidence, which, I believe, is shared by the country. He is assisted by a senior expert officer of the Royal Flying Corps, and it is the business of the War Office and the Air Board to give them all the aircraft

From a photograph received from a neutral country.

The pilot of a Hun seaplane handing orders to the skipper of a submarine. The engine of the seaplane is a Benz.

they may require. But do not let it be supposed for one minute I am saying they get all they would like, or anything approximately equal to the aircraft they would use if they had them. It has to be an adjustment, and this is most carefully thought out, between the demands of the various theatres of war. While we are endeavouring to do all we can to meet Lord French's demands, we cannot meet them all, and you are going to do exactly what the Germans want if you deprive your battle front of aeroplanes in order to lock them up against raids which may never come off. You have to study all the theatres of war and to adjust your supply of machines so as to meet, as far as possible, the requirements in each of those theatres. As regards the noble lord's second question, the officer in question—I am sorry that the innuendo should be directed against him that he is not a man to whom this duty should be entrusted—is an officer who has done extraordinarily good work, chiefly in the direction of warning fire brigade stations of the outbreak of fires.

As to the patrolling of the country by aircraft in relays of two hours' duration, I have to say that whatever the steps the authorities may take, the last thing I should do would be to give any information on the subject to the enemy. Any such steps ought to be kept as secret as possible. (Hear, hear.)

The Question of Reprisals.

With regard to the question of what are called reprisals, there is one point which is not sufficiently known, or, at all events, fully recognised. I allude to the amount of bombing behind the enemy's lines done day in and day out by our aviators. (Cheers.) I have the authority of the head of the Flying Corps in France for saying that for every bomb dropped behind our lines we dropped a hundred behind theirs. That bombing is done with a distinct military object and objective, and I venture to say that the whole country will associate itself with the view that we are not going to try to imitate the German in his brutality, and that the idea of an eye for an eye and a tooth for a tooth in the way of massacring women and children is absolutely repugnant to this nation. (Cheers.)

In any question of reprisals we must have a distinct military objective, something by which we can achieve not only the killing of soldiers, but the destruction of munition works and factories for the construction of guns.

More Aeroplanes Wanted.

I would say that the number of aeroplanes that any nation has is not equal to its demand, and, therefore, that what you have to do is to try first of all to meet that demand as far as possible. The Air Board is doing wonders in this direction, and surely the least thing we can do is not to tie the hands of the military authorities as to the best use they can make of their machines, but to give them the fullest power to use their machines in whatever way they think they can be best used for the purpose of bringing the war to a successful conclusion.

I am not one of those who wish to see this war carried on with kid gloves—we have got to hit back, but let the military authorities decide what is the best way of hitting back, and I can assure the House that the Government has given an absolutely free hand to the military authorities to use their air machines in whatever way they think best to secure military success.

There is not a day passes in which something fresh is not devised with a view to secure greater safety in this country. I can assure the House that at the present moment there is the closest possible co-operation between the Army and the Navy in these matters, and that steps are being taken by both departments to secure not only protection against enemy aeroplanes, but also to provide all the means of observation which are so necessary in order that our aircraft may be up in the air before an enemy force arrives.

As to the defence of Paris, it should be noted that the conditions there were entirely different. The German aeroplanes to approach Paris had to fly over the French lines, while they had nothing of that kind to do here.

Cock-and-Bull Story.

As regards the suggestion that some of our aeroplanes are flown by Germans, this is the first I have heard of it, and I should have heard of it if there were the least truth in the story. I may say also that there is not the least foundation for the statement that there has been an agreement between ourselves and the Germans not to shell villages far behind the lines. Do not pay attention to all these cock-and-bull stories. Everything that possibly can be done is being done at the present moment to defend not only London, but the whole kingdom against aircraft.

There is one further question, that, namely, of giving warning. I do not know a more debatable subject, and I cannot myself make up my mind as to what is the right and best thing to do. There are strong arguments both for and against warnings. But at a conference held only yesterday, when the best military, naval, and civil authorities were present, there was a consensus of opinion that the giving of warning might do more harm than good. I agree that it might be possible in certain circumstances, which we will consider, to warn hospitals, but there may be a great risk that the cry of "Wolf!" will be heard too often, and, therefore, that, in the end, there might be more danger and perhaps less preparation to meet it than at the present time. In concluding, I ask your Lordships to remember that the needs of our battle fronts must come first, and that we should only be playing into the hands of the Germans if we kept our aeroplanes here instead of distributing them where they can do more good in fighting the Germans in the areas of war. (Hear, hear.)

[On the whole, Lord Derby's reply is entirely adequate and satisfactory. On the question of reprisals, however, one would again point out that even if we do drop a hundred bombs behind the enemy's lines for every one dropped behind our lines, those hundred bombs are, presumably, merely making holes in France or Belgium, and so are doing no harm to Germany, and they are not having the slightest moral effect on the German people. One is glad, therefore, to see the remark that "in any question of reprisals" we must achieve "the destruction of munition works and factories." It suggests that something may be done about it.

The argument that Paris is protected by the fact that raiders have to fly over the fighting line is the proper reply to those who imagine that the alleged aeroplane patrol over Paris is what protects that city. Returning raiders would be met by the pick of the French *avions de chasse* from the aerodromes at the front. Similarly raiders returning from England have twice been met by some of our best fighting pilots from Dunkirk. So far it seems the London raiders were not so met, and still more curiously nobody has asked the Admiralty for an explanation, for this is no affair of the R.F.C.

If patrols are at all necessary, it is easier to patrol from Nieuport to the Dutch frontier than from Harwich to Dungeness, or even from St. Albans to Croydon, via Dartford, and if the Flanders patrol missed the outgoing invaders they could catch them on the way back. Perhaps the Vice-Admiral Commanding Dover Patrol will kindly arrange accordingly.

Finally, one quite agrees that the needs of our battle fronts must come first. And the best way to help the battle front is to destroy the enemy's sources of supply. Certainly we must not waste trained fighting pilots and first-class fighting machines by keeping them in this country waiting for raids which may only arrive once a month or so.]

The Earl of Selborne thanked the noble earl for what the House felt was a most admirable speech.

Lord Montagu's Warning.

Lord Montagu regretted that we had not got enough aeroplanes for all the work we had to do. We were using our best aircraft at the front, and the relative values of the kinds of work to which it was put could only be decided by the military authorities.

We must look forward to air raids becoming more frequent and more serious. The last air raid resulted in a casualty list of close on 600. Possibly this year, and almost certainly next year, we must expect a repetition of such raids; and if the casualties ran up to thousands, as they might easily do, the Government would be compelled to take a much graver notice of them.

It was absolute humbug to talk of London being an undefended city. The Germans had a perfect right to raid London. London was defended by guns and aeroplanes, and it was the chief centre of the production of munitions. We were, therefore, but deluding ourselves in talking about London being an undefended city and about the Germans in attacking it being guilty of an act unworthy of a civilised nation. That might be an unpopular thing to say at the moment, but it was the actual fact of the situation.

The right line for the Government to take was to say to the civil population:—"This is a war of nations and not alone of armies, and you must endeavour to bear the casualties you suffer in the same way as the French and Belgian civil populations are bearing the casualties incidental to this kind of warfare."

Those of them who knew the situation knew that London could not be protected from attack at the present time, and it would be better for the Government frankly to tell the people so. The proper policy in regard to the uses of our Flying Corps was that which was being followed by the War Cabinet, that of keeping our best men and machines at the front. The need was for more aeroplanes.

What was wanted was not a separate authority for the defence of London, but some one placed in supreme command of the whole Air Service. Every hour of the war showed the necessity of greater energy in the prosecution of the campaign by air. At the opening of the war the employment of air machines was thought to be a subsidiary issue. It was going to be the paramount issue before the end. Everything must be subordinate to the manufacture of aeroplanes.

[Lord Montagu's speech is certainly one of the soundest ever uttered on the question of aerial war. None can disagree with

a word of it. He disposes finally of the favourite English hypocrisy as to London being an undefended city, and the phrase "the Germans had a perfect right to raid London," only shows once more the intellectual honesty of the House of Lords.

His warning that we must expect bigger air raids is very necessary. Three German raids have reached this country and have got away with slight losses. As a result, at least 50 German pilots now know their way to London by air—for when once they reach the Thames they cannot go wrong. Many of their machines were three-seaters, so there may be as many as 70 or 80 pilots who have made the trip to the Thames. There is, therefore, little to prevent them from sending a fleet of 75 to 100 machines over on the next fine and clear moonlight night and doing really serious damage. The little that can be done to prevent such a raid depends on what the High Command thinks fit to do in the way of making it impossible to concentrate such a fleet in Flanders.

The real reply to the whole question and to this whole debate is Lord Montagu's dictum that "Everything must be subordinate to the manufacture of aeroplanes." Given enough aeroplanes, and assuming that they are properly handled, we can not only stop the invasion of England, but we can carry such an invasion into Germany as to deprive her armies of their supplies of munitions, to demoralise entirely her population of munition workers, and to force her to make peace on our terms.

It is purely a question of organisation, first of all at home, as concerns supplies, and secondly in the field, as concerns operations. For both purposes we have excellent men in important positions, General Brancker at home and General Trenchard in the field. If they are given a free hand, unhampered by inimical influences, and if they are loyally served by their subordinates—and if they can get rid of some of their inefficient and ineffective assistants—there is no reason why they two should not be the chief instruments in stopping the war.—C. G. G.]

THE INVASIONS OF ENGLAND.

According to the "Daily Mail" of June 29th, arrangements have been made by the Ministry of Munitions to give warning of the approach of enemy aeroplanes, and for the evacuation of the two upper floors. Similar provision is apparently made for the employees of the War Office and the Home Office.

If this report be correct, it strikes one that an organised desertion of official posts of duty, by persons who flatter themselves that they are on "war work," is playing into the hands of the enemy, and is setting but a poor example to the common people. And, anyhow, with the new German bombs, the top floor is about the safest place, as the results at the Poplar School demonstrate.

THE LONDON AIR RAID.

A Berlin semi-official telegram of June 28th says:—

The grief in Germany is not less than the grief in Great Britain that in the last air attack for military objects on London civilians, especially children, fell victims.

It has occurred to nobody in Germany to regard the death of these children as a justifiable reprisal for the hundreds of children who fell victims in the air raids on Karlsruhe, Freiburg, and Treves.

THE QUESTION OF REPRISALS.

Speaking at Birmingham on June 28th Mr. Kellaway, Parliamentary Secretary to the Ministry of Munitions, said demands for an immensely increased output of aeroplanes to prevent daylight raids on our towns and villages were now being made. "If I may express my own personal view," he added, "I believe that if we could systematically and immediately raid German towns every time that a raid was made on British towns and villages the public opinion of Germany would very speedily compel the German Government to abandon this senseless and brutal form of warfare. If the British Army possessed sufficient aeroplanes for all purposes on the Western front and for protective purpose at home, and had any to spare for raiding German towns, then I for my part would not hesitate to use aeroplanes for this purpose, and I believe that the conscience of the civilised world would justify us in doing so. (Cheers.) But it is quite obviously a case of having available a practically unlimited supply of aircraft, and that unlimited supply we do not, in fact, possess. To provide it we have to increase the available supply of certain classes of skilled labour."

AIR RAID WARNINGS.

The Lord Mayor has received the following letter from the Home Secretary:

HOME OFFICE, June 29th, 1917.

Dear Lord Mayor,—With reference to the interview which we had on the subject of public warnings of air raids in London, and the subsequent conference with yourself and some of the mayors, I think it right to inform you that the whole question has been brought before the Cabinet, and after very careful consideration of the advantages and disadvantages of the proposal, the Cabinet decided that it is not desirable in the public interest, in present circumstances, that public warnings of air raids should be given in London. As you were good enough to inform me that you were willing to leave the matter to the decision of the Government, and to abide by their decision, I thought you would like to learn from me the conclusion at which they have arrived.—Yours truly,

GEORGE CAVE.

OPENINGS FOR INVALIDED OFFICERS.

Gentlemen who have served as Officers in the Navy and Army, and who, for reasons of health, are unable to take up active service again, but who are sufficiently fit to accept useful and profitable employment in a tropical country, should communicate with the General Secretary of the Navy League, 13, Victoria Street, S.W.1.

THE SURVIVORS OF L.48.

The "Daily Mail" of June 29th says:—

Aviators are wondering why the Germans in reporting the destruction of Zeppelin 48, which was brought down in flames in an East Anglia village on June 17th, stated that the airship was under the command of Captain Victor Schütze, and that "the whole crew and the commander above-mentioned met the deaths of heroes."

The commander was not Schütze, but Captain-Lieutenant Eichler, 40 years of age, a clever pilot who was much "wanted" by the British aviators, and had taken part in several raids. Ample evidence was forthcoming at the inquest on the 20th to place him among the four men whom the military were able to bury in the afternoon of that day under their own names.

There are three survivors of the wreck. One is Lieutenant Mieth, the second in command, and the two others are warrant officers. They were three of the eight who jumped clear of the blazing airship, most of them being gathered in the fore part, which, as the airship took barely a minute and a half to come to earth, escaped the flames to the last moment.

Mieth broke both legs, and one of the warrant officers had a leg broken and other injuries. Both are in hospital in an eastern county. Mieth told a nurse there that he now believes in the English maxim that thirteen is an unlucky number. His last was his thirteenth air visit to England.

The third survivor, who received no injury whatever with the exception of a bruise behind the ear, is a military prisoner. This is the man who stated that he used some device inside his overcoat to make a crude parachute and check his fall.

Commenting on the destruction of this Zeppelin in East Anglia, the "Journal" (Paris, June 18th) says:—

This shows once more the remarkable mastery which our Allies have obtained in the air. It is to be observed that, with a single exception, all the recent excursions of Zeppelins over England have resulted disastrously. This brings to 23 the number of Zeppelins whose destruction has been ascertained in an absolutely certain manner since the beginning of hostilities. Of this number 12 were destroyed in the year 1916.

COPPER TUBE SPECIFICATIONS.

It will be remembered that a week or two ago a list of standardised sizes in copper tubing was issued by the Air Board and reproduced in this paper. It was then stated that detail specifications as to quality of copper and so forth would be issued at an early date. This full specification has now been issued, and though it is not advisable to reproduce it in full herewith, owing to the possibility of it being of use to the enemy, copies of the specification can be obtained by the authorised officials of firms constructing aircraft.

All heads of departments using copper tube should make a point of familiarising themselves with this specification, and any who have not received a copy should ascertain from their office whether this specification has been received, as it is unfortunately a fact that important official documents occasionally fall into the hands of departments in large firms, which departments are not immediately interested in those documents, and yet fail to pass those documents onto the proper departments.

Works' managers, works' foremen, and others in similar positions, may obtain copies from the Air Board, Strand, W.C.

Tubing 2½ in. by 20 gauge has been added to the standard sizes.

A WILL.

Mr. Horace Leonard Short, of Eastchurch, Kent, who died on April 6th last, left property of the value of £69,565 gross, with net personalty £59,770. The will, dated September 16th last, is proved by his brothers, Albert Eustace Short, of West Hampstead, and Hugh Oswald Short, of the Seaplane Works, Rochester, aeroplane manufacturers. Subject to a legacy of £1,200 to his wife, the testator leaves all the property in trust for her and his children.

CONCERNING PISTOLS.

BY "BERKELEY."

The Book of the Pistol and Revolver. By Captain H. B. C. Pollard. (McBride, Nast & Co., Ltd., 2, Breams Buildings, E.C. Pp. viii+230. Illustrated. 10s. 6d. net.)

Since the days of the first Mesopotamian scandal, when our earliest ancestors regretfully passed from the placidity of a garden to the endless worries of a workaday world, the ultimate settlement of quarrels has been almost invariably by hand-to-hand conflict. The arbalist, the sling, the bow, the cannon, the musket, and the rifle have each been produced that death might be transmitted by human agency through space. But none of these has destroyed the primeval joy of a personal struggle at close quarters for the elimination of the weakest or the most unwary. In such contests the pistol shares the glory with the sword, the mace, the lance, and the bayonet. Its importance as a weapon of daily warfare is increasing, and a book on its history and use is opportune.

The pistol was first produced as a substitute for the cumbrous arquebus that horsemen might carry firearms as a part of their equipment. Moreover, the pistol, even in those earlier days, was small enough and light enough to be carried at all times by those who felt that self-protection was a primary virtue of life. Its early uncertainty was no great drawback when used for protection, provided no premature attempt to fire was made. The assailant was often deterred by the knowledge that the pistol might not misfire.

To-day a pistol or revolver is an essential part of an officer's equipment. Even the aviator, armed as his machine is by the latest pattern of machine gun, finds the pistol of great value. In the early days of the war, many aerial combats took place between pilots armed only with revolvers, and it is stated that in recent times an observer whose machine gun jammed brought down his enemy with a Mauser automatic pistol. A rifle is too cumbrous to be carried with ease in the average aeroplane used for fighting purposes, but there is no difficulty in stowing away a pistol.

The first seventy-three pages of Captain Pollard's book are set aside for a brief history of the pistol and revolver from the end of the fifteenth century, the period of its invention, to the present day. In Chapter III he treats of the "wheel-lock," introduced in 1515 as an advance in design on the clumsy and uncertain match-lock. In it was used "a notched steel disc, revolving at high speed against a stationary flint or fragment of iron pyrites to produce a stream of sparks in the flash-pan." "This disc was connected by a short link of chain to a very strong spring inside the lock, and was wound up." On release by use of the trigger, the pistol was fired. The wheel-lock remained the accepted type of pistol until the Civil War, towards the end of which it was gradually succeeded by the flint-lock.

In action the wheel-lock was not over-satisfactory, if contemporary evidence is to be accepted. If the wheel were wound, or "spanned," as it was then termed, up too long before the time of use, the spring often refused to work in the moment of need. In Ludlow's Memoirs (Vol. I, p. 72) he says that in hand-to-hand conflict during the siege of Wardour he had to rely entirely upon his sword as his ". . . pistols, being wheel-locks and wound up all night, I could not get to fire." And Vernon, in the "Young Horseman," 1644, p. 11, advises his cavalrymen thus: "Never prime before you have spanned, and never span before you have need, because many times the firelock pistols will not go off if they have stood long spanned." Captain Pollock will find other information of value for his next edition in Vernon's book if he so cares.

It is of topical interest to remember that the Reiters, early exponents of German "frightfulness," were the first to make consistent use of the pistol. In de la Noue's "Politicke and Military Discourses," 1587, which I also commend to Captain Pollock, it is stated on page 199 that we must grant the Reiters "the honour of being the first that brought the pistol into use, which when a man can well handle I take to be very dangerous. The Germans among all sorts of horsemen that use this weapon do carry away the prize." Preparedness for war is not only a modern virtue with our friends the enemy.

During the reign of Elizabeth a long-barrelled pistol called the "petronel" was much in use. Captain Pollard suggests the following derivation for the name, "either from *poitrine-al*, the French word *poitrine*, meaning 'chest,' and indicating the mode of firing, the weapon being butted up against the breast, or from the Spanish word *pedragal*, 'stone,' in reference to the stone or flint held in the lock." May I suggest to the author that the word is really derived from the Spanish *petrina*, a belt, in which a pistol could be carried?

The flintlock which succeeded the wheel-lock in the middle of the seventeenth century remained in favour until the percussion system, invented in 1807, came into general use during the great peace which succeeded the troubles of the Napoleonic wars. From the percussion system to that prevailing to-day was a simple course of evolution.

In the eighteenth century inventive capacity in the matter of firearms being practically at a standstill, all effort tended towards the improvement of the existing arm, both mechanically and artistically. As the author points out, it is from this period that the most beautiful weapons come.

It was during this period that pistols entered largely into the science and art of duelling. Difficult though markmanship with a pistol may be, it is yet simpler than the use of the sword. By mistake the worst shot may hit a vital point of his target, but there is no room for error in fencing. Hard study and constant practice make the swordsman, in addition to inborn aptitude. The use of the pistol also permitted the infirm to defend their honour in the duel.

With the pistol, William, Lord Byron, great-uncle of the poet, killed William Chaworth in 1765, within the private room of an inn, for which offence he was tried by his peers. The pistol was the weapon chosen by the Duke of Wellington when he fought Lord Winchelsea at Battersea in 1829. The latter fired his pistol in the air and apologised, that he might avoid the risk of terminating an heroic life.

Pistols gave to highwaymen a chance of distinction in their chosen career, and helped thereby to enrich the pages of childhood's literature. Claude Duval, aided no less by a pistol than by charm of manner, was enabled to rob his fairest victims and then to dance the saraband with them under an approving moon. Dick Turpin would have had little need to ride to York had not his pair of pistols suggested the simple outlines of a profitable profession to him.

The book from page 74 onwards deals with ammunition (one chapter), with modern pistols and revolvers, and the manner of their use. The gradual development of ammunition is shown, with illustrations of various

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

types of bullets and cartridges. As a minor criticism, one is inclined to be disappointed by the lack of detailed drawings of sections of different cartridges. Such photographs as are given would appear to have been taken from makers' catalogues.

The descriptions of both automatic pistols and revolvers are very thorough, and demonstrate the author's exhaustive knowledge of this branch of the subject. This part of the book is clearly illustrated. The photographs in the historical section are spoilt in some cases by overcrowding, with the result that the detail is lost in reproduction.

In a chapter on the pocket automatic and revolver he speaks of the law in regard to the shooting of burglars, and advises his readers to avoid shooting burglars in the back if they desire to remain within the law. His veiled advice to those who dwell in Latin American Republics couched in the phrase, " . . . a wounded man means more legal trouble than a dead one," is commended to those whose interest in murder has so far been purely theoretic.

In a chapter headed "Miscellaneous Weapons" he has a little to say about the air-gun, which is still one of the persistent dangers of youth and a ready cause of inter-neighbourly war. Many domestic cats have been spoilt in their prime by the misplaced enthusiasm of a childish air-gunner. An interesting pistol described in this chapter is that known as the "Dedless," which is used "to render an assailant unconscious by means of a discharge of asphyxiating gases," and fires a cartridge composed of "pepper, lycopodium powder, and other ingredients."

The author shines most in his instructions to those who desire to learn the entire art of shooting with pistols and revolvers and in the care of these weapons. It would appear from internal evidence that he has considerable experience in the use of small firearms, both at the range and under other conditions where rapid action is the surest guarantee of continued existence. All these portions of the book are of high practical value to officers in the Flying Services. The necessity for speed in training during the present war makes it impossible for the official schemes of education on such matters to be very thorough or exhaustive, and it is therefore necessary for keen officers to gain additional and necessary knowledge by their own efforts.

Much information is given as to shooting at Bisley and on various home ranges. This, in so far as Bisley is concerned, has but little interest during the war, when personally conducted tours to any of the many fronts enable officers to gain that experience which outvies all others—firing at human targets animated with similar bellicose feelings and actions towards the firer. The stern reality of war is superior to all the practice of peace-time. A cynic once said that one ball cartridge in every thousand blank cartridges fired on manœuvres would give a valuable element of reality to an otherwise dreary drama in which the actors are the sole spectators.

The author attempts to disarm criticism in his introductory chapter by stating that all he desires to achieve is a "brief summary of pistols in their wide variation," and then invites it at the end by referring to this book as one that he hopes "may some day be the standard authority on pistols and revolvers." If he is to achieve his desire, he must be prepared to make many alterations and additions. His illustrations must be less crowded in order that detail may be shown more clearly. Six and seven pistols shown in one octavo page cannot be given clarity. The book badly needs an index. He should also show more readiness to quote authorities, and, if the book is to be the standard work on the subject, he should include a bibliography. His history is a little inchoate, though not inaccurate. The book, viewed as a preliminary monograph, is of great interest. As an exclusive authority it requires reconstruction. But I for one would wish nothing better than to see an enlarged and modified edition, when peace comes again, take its place among those fundamental works on which scientific history is based.

THE PARLIAMENTARY AIR COMMITTEE.

Viscount Cowdray had a long interview with a great many Members of Parliament on June 26th. Most of them belong to the Parliamentary Air Committee, which is now a strong non-party body, including Peers and Commoners, and Mr. Joynson-Hicks, the chairman o fthe Committee, presided. Lord Cowdray was accompanied by all his colleagues on the Board—General Sir D. Henderson, Commodore Godfrey Paine, R.N., Sir William Weir, and Major Baird. They went with detail into the work and policy of the Board, and as many of the statements made were of a confidential character it would be improper to publish particulars of this private meeting.

It is rumoured that Members generally were very well pleased with the information, and some who have been keen critics of the Board in the House were most emphatic in their expressions of satisfaction. There can be no doubt that the effect of the meeting has been good. It is permissible to add that not the least gratifying of the particulars furnished had reference to the great advances that have been made in the rapid turning out of the various types of machine now in use.

THE UNITED STATES NAVY.

All about the United States Navy. Compiled by E. Tyrrell from "Fighting Ships." Sampson Low, Marston and Co., Ltd. pp. viii and 56. 1s. net.

Since the days when Oscar Wilde included American mothers and American battleships among the ruins and curiosities of the New World, the Navy of the United States has progressed from a condition that was of interest to one of use. No longer can the antiquary find in the United States Navy ready material for an archaeological monograph on the ships of the ancients. The antique, save, perhaps, in the case of the President's yacht, has gone, and its place is taken by modern transatlantic efficiency typified in ships graced with the exotic beauty of the Statue of Liberty and possessed of all the inherent engineering virtues of a land of which the Ford automobile is typica'.

The United States of America, having in accordance with the general practice of the day declared war on the Central Powers, their Navy, assisted by that of Great Britain, will be actively engaged in the suppression of German naval activity in European waters. It is, therefore, opportune that Messrs. Sampson Low, Marston and Co. should publish a book of silhouettes of the fighting ships belonging to the new Ally.

In it are illustrated all classes of ships in the U.S. Navy, from the latest Dreadnoughts, such as the "California" and the "Tennessee," to a survey ship euphoniously known as the "Paducah." The principal dimensions and armament are given in almost every case, and so long as an American man-of-war can be persuaded to present a broadside view there is little reason why the weary Londoner seeking relaxation at Margate, or the R.N.A.S. officer on the coast, should not gladden his heart by recognising, with no less accuracy than that of a sea-going naval officer, the ships of our transatlantic cousins. Furthermore, there are illustrations of the naval flags and of the rank distinctions on the uniforms of American naval officers—information which is of high value in these days of blue-garbed hotel porters and cinema guardians.

Two maps are given, one showing the naval stations of the United States and the other the complicated Atlantic entrance to the Panama Canal.

The booklet may be obtained for 1s. 3d., post free, from The Wm. Dawson Publishing Co., Ltd., 2, Breams Buildings, E.C.

VON RICHTHOFEN'S CIRCUS.

There has been so great a demand from officers of the Royal Flying Corps for copies of the original photograph of Captain Baron von Richthofen's "Travelling Circus," that arrangements have been made to supply enlargements to any who require them. These enlargements, which are bromide prints of excellent quality, may be had in the following sizes:—8 in. by 6 in. 1s. 6d., post free; 12 in. by 9 in., 5s., post free; 24 in. by 18 in., 10s. 6d., post free. The last size makes a handsome picture for framing. These may be had from Messrs. Ashworth and Meredith, Photo Engravers, 190, Strand, W.C.2.

THE DISTINGUISHED SERVICE ORDER AND THE MILITARY CROSS.

Major Leonard Learmount, R.F.C.
Major Henry Petre, Australian F.C. and R.F.C.

THE DISTINGUISHED SERVICE ORDER.

Sqdn. Comdr. Edward Newton-Clare, R.N.A.S.
Lt.-Col. Frederick Cleaver, R.F.C.

The King then conferred decorations as follows :—

THE DISTINGUISHED SERVICE CROSS.

Flt. Lt. William Gardner, R.N.A.S.

THE MILITARY CROSS.

Capt. Harold Jensen, General List and R.F.C.
Capt. Geoffrey Knight, R.F.C.
Lt. William Harper, Durham L.I. and R.F.C.
Lt. Hugh Robb, R.F.C.
Sec. Lt. Arthur Turner, R. War. R., attd. R.F.C.

* * *

Capt. A. J. Evans (R.F.C.), and Lt. S. E. Buckley (Northamptonshire Regt. and R.F.C.) had the honour of being received by the King yesterday.

NAVAL.

The following appointments have been made in the Royal Naval Air Service :—

JUNE 27th.—Messrs. W. A. Johnson and S. E. Ould granted temp. coms. as Lts. (R.N.V.R.), both with seniority June 23rd.

JULY 3rd.—Lt. R. B. Maycock graded as a prob. Flight Comdr., to date June 30th. [What is a prob. Flt. Comdr.?—Ed.]

Mr. G. L. Tyser granted a temp. commn. as Lt., R.N.V.R., with seniority June 28th.

Temp. Lt. (R.N.V.R.) G. H. Millar entered as prob. Observer Officer, to date June 17th.

ADMIRALTY COMMUNIQUÉS.

JUNE 26th.—In the course of a patrol on the 25th inst. three machines of the Royal Naval Air Service encountered and engaged 10 enemy machines in the vicinity of Roulers.

After 16 minutes' fight one enemy machine was seen to go down in flames. It is thought that two more were driven down out of control, but owing to clouds this could not be verified.

Our three machines finished their patrol and returned safely.

THE CASUALTY LIST.

Reported June 27th.

ACCIDENTALLY KILLED.—Flt. Sub-Lt. John N. McAllister, R.N.
MISSING.—Flt. Sub-Lt. Robert G. Saunders, R.N.
Flt. Sub-Lt. Alan B. Holcroft, R.N.
PREVIOUSLY REPORTED MISSING, NOW OFFICIALLY REPORTED PRISONER OF WAR.—Flt. Sub-Lt. Arthur S. Mather, R.N.

Reported June 30th.

ACCIDENTALLY KILLED.—Jones, Flt. Sub-Lt. A. C., R.N.
MISSING, BELIEVED PRISONER.—Nash, Flt. Sub-Lt. G. E., R.N.
ACCIDENTALLY INJURED.—Clark, Flt. Sub-Lt. W. E. N., R.N.
Orfeur, Observer Sub-Lt. C. B., R.N.

Reported July 2nd.

ACCIDENTALLY KILLED.—Tulley, Flt. Sub-Lt. J. R., R. N.

LAND—SEA—AIR

Government and People are now united in the conviction that the BRITISH EMPIRE must maintain supremacy in ALL THREE ELEMENTS.

PETTERS LTD.

demonstrated many years prior to the Great War that their OIL ENGINES were the best friend of the AGRICULTURIST in assisting the production of FOOD. In later years they were again to the front in the application of Oil Engines for MARINE PURPOSES. Now in the time of WAR STRESS they have proved that the same engineering and business organisation can produce AIRCRAFT of unequalled merit.

NEGOTIATIONS

are now invited for POST-WAR AIRCRAFT MANUFACTURE, and your enquiries will be greatly appreciated.

PERSONAL NOTICE.

MARRIAGE.

CROSS—BARKER.—On June 22nd, at U.F. Church, Burnt Island, Fifeshire, Flt. Lt. Bernard C. H. Cross, R.N., son of Mr. and Mrs. H. E. Cross, of Elborough Street, Southfields, London, was married to Jessie L. Barker, of Southfields, by the Rev. A. Scott Murray, B.D.

It is officially notified that letters and parcels for officers and men of the Royal Naval Air Service who are serving abroad should be addressed as follows: Name of addressee (stating rank or rating), unit in which serving (e.g., No. 4 Wing or No. 11 Kite Balloon Section), care of G.P.O. The words "B.E.F." should not be used.

* * *

Flt. Sub-Lt. L. P. Paine, D.S.C., R.N., who was reported missing is now reported to be a prisoner of war. Sub-Lt. Paine, who is a brother of Mr. Hubert Scott Paine, director of the Supermarine Aviation Works, Ltd., at Southampton, has long been concerned with aeronautics. He was engaged with his brother Hubert in experimental work as far back as 1910, and has been closely connected with developments ever since. Before being taken prisoner he had seen a considerable amount of service in Egypt.

MILITARY.

G.H.Q. COMMUNIQUÉS.

JUNE 26th, 9.12 p.m.—In air fighting yesterday two German aeroplanes were brought down, and three other hostile machines were driven down out of control.

One of our aeroplanes is missing.

JUNE 27th, 9.4 p.m.—Much successful work was accomplished by our aeroplanes again yesterday.

In air fighting, five German machines were brought down and two others were driven down out of control. In addition, one hostile machine was shot down by fire from the ground.

None of our aeroplanes are missing.

JUNE 28th, 9.10 p.m.—Activity in the air continued yesterday One enemy aeroplane was brought down in air fighting, and two others were driven down out of control. In addition, two hostile machines were shot down, and two others driven down by fire from the ground.

Four of our aeroplanes are missing.

JUNE 29th, 8.55 p.m.—One German aeroplane was brought down yesterday in air fighting.

None of our machines are missing.

JUNE 30th, 9.5 p.m.—Several encounters took place in the air yesterday between our aeroplanes and large formations of hostile machines.

As a result of the fighting, five German aeroplanes were brought down and four others were driven down out of control. One other enemy machine was shot down by fire from the ground.

One of our aeroplanes is missing

WAR OFFICE COMMUNIQUÉS.

JUNE 27th.—The General Officer Commanding British Forces in Macedonia reports:—The R.F.C. and R.N.A.S. have bombed Provista and Razolivos (east of the southern end of Lake Tahinos), Demir-Hissar, and other places south of the Rupel Pass, and Furka (west of Lake Doiran), causing damage to the enemy's camps and dumps.

JUNE 28th.—The General Officer Commanding Mesopotamia Expeditionary Force reports:—On the 22nd inst. our aeroplanes bombed one of the few remaining Turkish river steamers, obtaining at least one direct hit with a 65-lb. bomb.

On June 25th hostile aeroplanes bombarded our camps without doing any damage. On the following day we retaliated by dropping 24 bombs on the enemy's camps at Tekrit (on the Tigris, about 30 miles above Samarra). Seven direct hits were observed on tents, which were destroyed, and other bombs exploded close amongst the enemy's tents, inflicting damage. All our machines returned safely.

JUNE 29th.—The Secretary of the War Office makes the following announcement respecting the campaign in Palestine:—

The general situation remains unchanged.

There has been considerable patrol activity in which we have secured prisoners.

Successful air raids have recently been carried out. Six hundred and fifty pounds of bombs were dropped on the supply depot at Tul 'Keram on June 23rd, severely damaging rolling stock and the station buildings. On the same date 1,180 lb. of bombs were dropped on the aerodrome at Ramleh.

On June 26th some 50 bombs were dropped on the military establishments near Jerusalem.

PERSONAL NOTICES.

DEATHS.

ADENEY.—Sec. Lt. Robert Edward Adeney, the Queen's (Royal West Surrey Regt.), attached R.F.C., reported "missing" on April 11th, and now reported by the Comité International de la Croix-Rouge, Geneva, to have died at Douai from wounds received in an aerial action on that date, was the only son of Mr. and Mrs. W. H. Adeney, of Dulwich, and was aged 19. He was educated at the City of London School and Hurstpierpoint College.

In March, 1915, at the age of 17, he joined the Inns of Court O.T.C., and received his commission the following June. Last August he was attached to the R.F.C., and got his "wings" in December.

His squadron commander writes:—"Lt. Adeney's patrol was seen to successfully engage a hostile patrol, two of which they destroyed, and about an hour later they were heavily engaged with a far superior number of hostile machines (ten to three) . . . He was one of the most universally liked officers in the squadron, he did not know what fear was, and had all the requisite qualities for a R.F.C. pilot. The whole squadron deplores his loss."

ASHLEY COOPER.—Lt. Cyril Ashley Cooper, E. York Regt., attached R.F.C., was killed on the 29th ult., together with a mechanic, while flying from a Scottish aerodrome. Mr. Cooper was the son of Mr. and Mrs. Ashley Cooper, of Lyndhurst, Elm Park Road, Winchmore Hill, N., and was commissioned to the East Yorks Regt. in May, 1915, whilst in France. He returned to this country, and later, in 1916, transferred to the R.F.C., obtaining his wings in Feb. last. At the time of the accident he was acting as instructor in gunnery.

BARRON.—Sec. Lt. H. E. Barron, R.F.C., was killed at Hendon on the night of June 25th through his machine falling to the ground. He was 42 years of age.

DARRON.—A verdict of death by misadventure was returned on June 28th at an inquest on Sec. Lt. John George Darron, 33, R.F.C., who was killed while flying. His machine fell about 150 ft.

FOLLIT.—Lt. Reginald William Follit, R.F.C., reported missing on April 28th, is now stated by his observer (a prisoner) to have died after an aerial engagement in France. He was the younger son of Mr. William Follit, of Avenue House, Clapham Park, S.W., was educated at St. Lawrence College, Ramsgate, and early joined the H.A.C. After the outbreak of war he was granted a commission in the R.F.A., and when in France was transferred to the R.F.C., acting as an observer. He obtained his pilot's certificate in England, and returned to the front on April 18th.

GEORGE.—Lieut. H. D. K. George, Royal Dublin Fusiliers and R.F.C., who died of wounds as a prisoner, was the only son of Mr. and Mrs. Duncan George, of Stanhope Terrace, Hyde Park, and was born at Satara on July 23rd, 1897. He was educated at Clifton (Barff's House), and passed direct into Sandhurst in September, 1914. After completing the Sandhurst course, he received a commission in the Royal Dublin Fusiliers, and, following a period of service with a battalion in Cork, he joined his regiment in France.

In July, 1916, he returned to England for a course of training for the R.F.C. In March, 1917, he went to the front, and during a reconnaissance far behind the German lines his patrol, under the command of Capt. Leefe Robinson, V.C., attacked and was heavily engaged with a large number of hostile aircraft. Mr. George's machine, piloted by Lieut. Leckler, was forced to land at Lewardi, south-east of Douai, where he was made a prisoner and removed to St. Clothilde's Hospital at Douai, wounded in the leg and back. In the German list, dated May 23rd, Mr. George is reported to have died on April 6th.

HAMBER.—Capt. Harold B. Hamber, R.F.C., son of the late Eric Hamber, of Winnipeg, Manitoba, and brother of E. W. Hamber, of Vancouver, British Columbia, aged 32, was accidentally killed on June 22nd while flying.

HARVEY-KELLY.—Major Hubert Dunsterville Harvey-Kelly, D.S.O., Royal Irish Regt., attached R.F.C., killed in action, was the son of the late Colonel H. H. Harvey-Kelly, of the Indian Army, and was born in 1891. He joined the Irish Regt. in 1910, got his captaincy five years later, and the rank of major very shortly afterwards. Major Harvey-Kelly has been a squadron commander in the Royal Flying Corps since the beginning of last year. For his services during the present war he has been mentioned in dispatches, and in 1915 was awarded the D.S.O.

Major Harvey-Kelly was among the most universally beloved officers of the R.F.C. Though very young for his rank, he won the confidence as well as the personal regard of all who served with him. A fine pilot, brave to recklessness, a humorist of the first class, and withal a good soldier, his loss will be deeply felt by all who knew him.

He learned to fly on Laffan's Plain in 1911 or so on a Cody machine, and in him has died the last of the pilots who flew the Cody biplanes Lieut. Wilfred Parke, R.N., Mr. Rogers-Harrison, Major Raleigh, and Mr. Cody himself have all gone before him. His early days in the R.F.C. were spent in the famous No. 2 Squadron, R.F.C. at Montrose, where, as everywhere, he made hosts of friends. From the beginning of the war he did splendid work, and, like so many gallant Irishmen, he gave his life in the service of the King of England.

LEE.—Capt. Richard Henry Driffield Lee, Norfolk Regt. and R.F.C., who was killed on June 23rd, while flying, was the only surviving son of the Rev. Frederick and Mrs. Lee, of Woodton Rectory, Bungay. He was 29 years old.

LINDSAY AND SHARMAN.—Capt. George Walter Thomas Lindsay, R.F.A. and R.F.C., and 1st Class Air Mechanic C. E. Sharman, of Sheffield, were killed in an accident near Bristol on June 25th, their machine falling from a considerable altitude.

Capt. Lindsay was the eldest son of Col. H. E. Morgan Lindsay, C.B., R.E., of Ystrad, Mynach, near Cardiff, and a grandson of the first Baron Tredegar.

MORRIS.—Sec. Lieut. Francis St. Vincent Morris, Sherwood Foresters and R.F.C., who, at the age of 21, died of wounds received in action on April 10th, was the youngest of the four sons of Canon and Mrs. Morris, of Ashbourne, Derbyshire. Educated at Bowden House, Harrow, Seaford, and Brighton College, on leaving school he entered Wadham College, Oxford, but at once applied for and obtained a commission. Subsequently he was attached to the R.F.C., of which he became a most capable officer. In the execution of a daring flight his machine was brought down in a snowstorm, and from the serious injuries he received he died on April 29th. His three brothers are serving with their regiments in France.

NASON.—Capt. and Flight Comdr. John William Washington Nason, Royal Sussex Regt. and R.F.C., of Grosvenor Crescent, St. Leonards-on-Sea, who played cricket for Cambridge University in 1909 and 1910, and for Sussex and Gloucester Counties, and Association football for the University, and was killed on June 9th, aged 27, son of the late Dr. Nason, of Corse Grange, Gloucester, has left property of the value of £8,894. The will, made on active service, reads:—"Anything or any money I have is to be divided between you, Baby, and Charlie." Probate is granted to Lieut. William Frederick Charles Nason, R.F.C., his brother.

NEILL.—Sec. Lt. Rolf Mayne Neill, R.F.C., whose death is officially announced, was killed in an air action in June 3rd, aged 19. He was the only son of Mr. Harold Neill, London correspondent of "La Prensa," Buenos Aires, and Mrs. Neill, of 22, Eldon Road, Kensington, W.8. He was educated at the Priory, Malvern, and Westminster School, where he was in the O.T.C., from which he went straight into the Royal Flying Corps. He was a keen footballer, and obtained his pinks. In three months he gained his "wings," and joined a squadron at the front. He was killed on the anniversary of the day on which he was commissioned. When he was missing his major wrote:—"Your son had done splendid work with us since he rejoined, and I cannot say how much we all miss him." A brother officer wrote:—"I have only known your son since he came back from hospital. In that short time I have learned to regard him as one of the very best fellows I have met out here, not so much because he knew no danger, but rather because, realising it, he never let it interfere with his duty."

REYNOLDS.—Lieut. Edgar Kinsey Reynolds, Canadian Infantry and R.F.C., was killed while flying on June 27th. He was the son of the late Mr. E. K. Reynolds, of the Ottoman Bank, Alexandria, and Mrs. Reynolds, of Calgary, and was 26 years old.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The British Aircraft Industry.

BY CHARLES L. FREESTON.

XXII.—GORDON WATNEY AND CO., LTD.

There was a certain period in motoring history when Mr. Gordon Watney proved himself to be something of a wonder-worker. Up and down the country there were numerous Mercédès cars which had become out of date, so far as catalogue models were concerned, but were otherwise efficient and sound as a bell. They were highly expensive cars, too, and their owners had to face the alternative of cutting a loss and conforming to current fashion by buying the latest Cannstatt model, or else rest content to jog along on something that was obsolete though serviceable.

Car Conversion.

To them in their perplexity appeared Mr. Gordon Watney as the welcome *deus ex machina*. Recognising the fact that the cars were of super-excellent material and workmanship, and mostly only needed bringing up to date in ways that were immediately visible, he conceived the idea of converting them accordingly. He established a workshop at Weybridge, and began to collect Mercédès cars, and by one means or another effect transformations in their appearance and design. With a lengthened wheel-base, a new bonnet, and something better than the old scroll clutch, to say nothing of other details, an old Mercédès could be made into a vehicle that was both smart and serviceable.

And Mercédès cars were so numerous in this country that Mr. Watney's workshop was kept busy for years with the process of conversion. In course of time the place became the recognised home for the products of Cannstatt and Stuttgart which needed repairs or any kind, and as "Mercédès specialists" the firm of Gordon Watney and Co., Ltd., were famous throughout the land.

Major Gordon Watney.

A Racing Reminiscence.

For Mr. Watney did his work well and had good stuff to handle. It may be doubted whether a better car of its type was ever built than the famous "sixty Merc." Even when it had been supplanted by the 90-h.p. models, it was good enough to win the Gordon Bennett Cup Race in Ireland in 1903, although much bigger cars had come along in the interim and were pitted against it.

Three "nineties" had, in point of fact, been entered for the great race, and were regarded as very likely winners, at all events the Mercédès crowd, with whom I happened to travel to Madrid after the first stage, which also proved to be the final, of the Paris-Madrid race, were in high feather as to their prospects for the coming event.

The Cannstatt Fire.

Then came the holocaust at Cannstatt, which reduced all the "nineties" to scrap-iron, and on the morning of the Gordon Bennett race in Ireland, when I ran against one of my former Sud-Express companions at Ballyshannon, nothing could have been more doleful than his expression or his predictions. The amateur-owned "sixties," which had been pressed into service, he did not regard as having a dog's chance, and, as a matter of fact, they did have one weak point—the back axle, which was not expected to stand the racket of the course.

However, as everyone familiar with motor-racing history will remember, though Baron de Caters and Foxhall Keene did come to grief with broken axles, Jenatzy sailed home the winner. The burly Chevalier de Knyff ever afterwards regretted that he paid too much respect to the course and took his first two laps too slowly on his Panhard.

A Keen Sportsman.

With a factory so near to Brooklands it was only natural that Mr. Gordon Watney should take an active interest in automobile racing, and right up to the close of the track's career he was ever a prominent feature of the periodical meetings. There were often races, indeed, confined to Mercédès cars alone, but Mr. Watney also raced on any other type of car that was good enough for the job, and annexed a large array of prizes.

Indeed, as the last Brooklands' race meet was held on August 3rd, 1914, only the day before war was declared, and as he won, *inter alia*, the "Lightning Handicap," on that occasion, the last important race on the track, he has enjoyed the custody of sundry annual trophies ever since, and these, added to others which he had won outright, make a most formidable show upon his sideboard, and one which it would be difficult to find excelled elsewhere.

A Fine Company.

A few days after war was declared, Mr. Watney obtained a commission in the A.S.C. (M.T. section), and formed and trained himself one of the finest companies ever sent out to the front. They were all skilled mechanics, and their services must have been invaluable at a time when many men were pitchforked into the M.T. section although they had no mechanical knowledge whatsoever. It was entirely through this laxity of method, in fact, that so many of our lorries were left derelict on the roads of Belgium and France.

As an Examiner.

For a considerable time Major Gordon Watney was engaged in the North in examining candidates for the M.T. section of the A.S.C., a task for which he was peculiarly well fitted by his knowledge of the practical requirements of the case and the intuition which he had displayed in the choice of his own men at the Weybridge works before the war. Even during 1915 there were applications galore for enrolment in the M.T. section from men who could neither drive a car nor handle a spanner, but Major Watney examined the recruits from morn to eve, and saw that none were passed into the M.T. section who were not thoroughly qualified for the work.

Saving £100,000.

In the summer of the following year the excellent resources of the Weybridge factory were called into play in connection with quite a remarkable achievement, as to which the Canadian papers had a good deal to say.

No fewer than 59 motor lorries belonging to the Canadian Contingent on Salisbury Plain had been condemned as unfit for the front or even as scrap, but Major Watney had the whole batch transferred to Weybridge, and there they were one and all overhauled, supplied with new parts where necessary, and finally turned out in workmanlike guise and sent off to the theatre of war. The Canadians were astounded, and it was declared by their journals that Major Watney had saved Canada half a million dollars by this achievement.

Aircraft Engine Repair.

Then, in the early part of 1916, Major Watney left the North Country and, at the request of the War Office, took up the highly important work upon which he has ever since been engaged, and with the fullest measure of success—namely that of the repairing of aircraft engines. He gathered around him a group of the finest engine mechanics in the country, and also addressed himself to the task of enlarging his establishment.

This has since grown nearly ten-fold, and is replete with everything of the best in the way of machines and tools. Beginning with the repair of some Le Rhone motors, the works subsequently grew to be the recognised hospital for Clergets, Gnomes, Beardmores, and R.A.F. aircraft motors which had suffered damage at the front or elsewhere.

Marvels have been accomplished in the way of renovation, and engines that to the eye seem only fit for scrap as the result of shell-fire are expeditiously turned out as good as new, always provided the eternal spare parts problem does not interrupt the process.

A Model Factory.

Seldom, if ever, have I seen anything more pleasing in the way of factory organisation and equipment than was afforded in the course of a tour of the works with Major Watney. The general scheme was excellent down to the minutest detail, and afforded on every hand the most ample evidence of expert management in design and control. As many as 126 engines have been turned out in a single month. Certainly Major Watney has displayed powers in the building up of this new industry even more thaumaturgic than those with which his name was associated in connection with the Mercédès car.

And one thing of which I could not fail to make special note was the air of keenness and capability which every man and woman in the various departments displayed at their work. In this respect there is often a wonderful difference between one factory and another, but at Weybridge it was clear that the whole place was animated by the right spirit of zest for the work in hand and pride in its accomplishment.

Also it was patent enough during my tour of inspection that Major Watney enjoys the full respect and confidence of his many hundreds of workpeople, and equally that he has shown remarkable skill in the selection of his employés. These factors may be held in no small measure to account for the highly satisfactory work by which the firm has become distinguished. It may be added that the canteen and other arrangements for the comfort of the workpeople of both sexes leave nothing to be desired.

Finally it may be mentioned that ere long Messrs. Gordon Watney and Co., Ltd., will be producing standard engines on their own account, an announcement which will in no way be surprising to anyone who has examined the resources of the establishment, and the skill and thoroughness which are manifested in every department of the concern.

GERMANY AND WAR PROFITS.

Writing in the "Morning Post" recently, Mr. Massac Buist touched on a subject which is directly of interest to aircraft manufacturers, namely, that of War Profits, and the German method of dealing with them. How he came by his information he does not disclose, but one may take it that his statements are strictly accurate. Dealing with the great aero-engine firms, the Mercédès, Benz, Oberursel and Austro-Daimler firms, he says:—

"The Daimler-Mercédès, with 8,000,000 marks capital, has doubled its pre-war profit (3,214,168 marks), the profits in the last working year being 6,620,104 marks—over 80 per cent. on the capital employed. During all this time the dividends have risen, starting from 14, proceeding to 16, and then to 25 per cent. How the Germans view their industries' is incidentally revealed by the fact that the quotation for the shares is practically a reflection of the profits, having been 328 marks per 100 mark share the year before the war, and 630 marks at the end of this year.

"German policy, of course, aims at enabling their manufacturing enterprises to put themselves in as strong a financial position as possible during the war instead of subjecting them to excess profits duty to the extent that obtains in this country.

"It is not generally known here that the Benz firm is a much larger enterprise than the Daimler-Mercédès, but, as a matter of fact, it has a capital of 22,000,000 marks. The magnitude of the Benz concern is due in a large measure to amalgamations. Though possessing nearly three times the amount of capital that suffices for the Daimler, the Benz firm is to-day making only half the profits, and only two-fifths of the profits made in the pre-war year. On the other hand, the greatest profits so far returned by any of the German motor enterprises was secured in 1914 by the Benz—8,898,549 marks, against 5,012,644 marks in 1913, and 3,019,466 marks in 1915. In spite of this striking diminution of profits, the dividend has risen from 10 per cent. in 1913, to 20 per cent. in the last financial year; and the price of the 100 mark shares from 141.5 marks when the war broke out to 280 marks at the end of 1916.

"The general conclusion to draw from this and from the case of the three next most important motor manufacturing firms in Germany is that the majority of them are conserving their financial resources, and building up very strong positions for the post-war period.

"An interesting sidelight on the dependence of the German air services, no less than our own, upon French engineering genius is furnished by the fact that the Oberursel Motorenfabrik, which manufactures Gnôme aero-engines under licence, and which has a capital of 2,250,000 marks, paid 8⅔ per cent. dividend in 1913, 12 per cent. the following year, and 35 per cent. in 1915. No later figures are available. The respective profits for these three years were 243,774 marks, 392,865 marks, and 1,619,006 marks. The present price of the 100 mark share is 450 marks.

"Practically all these concerns are continuing to enlarge the scale of their enterprise, a remark which also applies to Austrian motor firms. For example, the Austrian Daimler has increased its capital by 50 per cent. to 12,000,000 crowns, and Graf and Stift by 25 per cent. to 2,000,000 crowns. In Austria these industries are also allowed to retain a large share of their profits.

"That the directors are using them in the proper way is shown by the circumstance that the Austrian Small Arms Co., the largest European manufacturing enterprise of muskets, has set aside 30,000,000 crowns from its huge war profits for a new motor works to start the production of 10,000 cheap, standardised cars a year. In order that it may be independent of the steel producers, the parent firm has bought the entire interest in a steel factory at Gudenburg for 54,000,000 crowns."

A POINT TO NOTE.

A correspondent writes:—

Sir,—I notice in Col. Mervyn O'Gorman's lecture that he does *not* point out the very serious danger which will attend State subsidation of aeroplane making, which he seems to advocate—namely, State interference. There are plenty of people who will, on the one hand, see to it that the subsidy is as small as possible, and, on the other, that the interference is a maximum. This aspect also needs ventilation.—I.S.F.

INSTRUCTION.

On June 26th the ceremonial opening of the West of England instructional factory of the Ministry of Munitions at Bristol took place. Mr. James Currie, director of training munition workers, explained that this factory would be devoted to training and producing parts of aeroplanes, and if it secured a supply of students of the right stamp it would take and teach from 200 to 250 every six or seven weeks.

The students would be chiefly young women, but discharged soldiers and military ineligibles may be engaged if suitable.

The Production of Aeroplanes and their Components

(Fourth Instalment.)

BY STEPNEY BLAKENEY.

Assembling and Erecting.

The erection of the rear half of the fuselage can now be commenced, and, for the purpose of this article, we can assume that the fittings have been made, and that the swaged tie-rods, fork-ends, and nuts are in stores, also all necessary bolts and nuts.

Owing to the design of the fuselage, the best way will be to assemble the bottom part of the fuselage first in a jig. To do this, it must be built upside down, to permit of the three-ply being glued and screwed down on the bottom side at the rear end.

A jig being a mechanical apparatus for enabling labour to produce interchangeable component and whole parts, it follows that as much care and thought, and sometimes expenditure of time and material, must be spent on it, as the cost of producing perhaps two or three of the required component parts by other methods, which invariably fail in producing repetition work accurately. To start with, ordinary wooden setting-out tables are useless, for however tightly the boards are clamped together, and cross-battened underneath, expansion and contraction always takes place; therefore, until a better method is generally known, it is best to cover the top on which the setting out is done with three-ply about 3-16 in. thick, as the contraction and expansion of this material is negligible, and upon this jig work can be developed and built up.

An Assembling Table.

Therefore, we can proceed to build the table of ¾ in. or 1 in. flooring, well clamped together and screwed to cross battens with about 3 ft. centres, of the same material. It should then be put into the shop, where it is to remain permanently, carefully laid and bedded horizontally on about four trestles, as the length will be about 12 ft. 6 in. long by 4 ft.

There it should, if time permits, be allowed to remain for two or three days to season, after which the top should be carefully tried for level with a straight-edge, in the following manner. Try each side and each end, and try it square across the centre, then diagonally from corner to corner, and make it true to all these tests.

It may then be covered with the three-ply, which should only be screwed down with just a sufficient number of screws to hold it evenly and firmly down to the table. Do not attempt to plane the top surface if uneven. Three-ply, 3/16 in. thick, won't stand this. Take it up and alter the deal boards below.

Having prepared and finished the table, plane one edge of the table, and test it with a straight-edge until it is true. This edge is wanted by the setter-out from which to use his square, and as a base-line. Also, don't trust to squares; only about one in ten is dead true. After you have set out a line at right angles to a base-line, test it. This can be done by the following method, which most men know.

Measure off on the base-line any four units of length, and three of the same units on the line to be checked, the third side or hypotenuse of the triangle should equal in length five units. This is known as the 3—4—5—method, and these units may be inches, feet, yards or miles. The method is based on the old 47th Prop. of the First Book of Euclid, which proves that the sum of the squares of two sides of a right-angled triangle are equal to the square of the hypotenuse, or side facing the right angle. Thus $3^2 + 4^2 = 5^2$, or $9 + 16 = 25$, so the angle between 3 and 4 must be a right angle.

Check these distances with the use of fine trammel points if possible. If this last measure does not meet the extreme points of the other measurements exactly, then the line which is supposed to be at right angles to the base-line is incorrect, and a further check must be made.

Setting Out.

We can now proceed to study the plan of the fuselage, preparatory to setting it out on the jig table. Having done this, the first thing to do will be to find accurately the centre of the table. Mark these points with a soft pencil, then check each of these points from the base-line, or trued edge, of the table. If they are not dead accurate, alter the point so that each point is absolutely the dead same distance from the base-line as the other. This is most important, and if not given minute attention, may cause endless trouble and perhaps cause the bottom part of the fuselage to be so out of square and inaccurate as to necessitate it being scrapped. It may only be ⅛ in. out, perhaps only 1/16 in., but it is wrong, and, as wrong, it will be rejected. Excuses of any kind cannot, and will not, be tolerated.

It is best, owing to the accuracy required, for the setter-out to provide himself with a pocket-knife with a conveniently shaped handle, and, after having found the points approximately with a pencil, to mark all measurements permanently with a fine knife cut, after he is satisfied they are correct. Pencil marking is useless for real accuracy.

Having found the centre of the table at each end, lay a straight-edge along the table and with the pocket-knife draw or cut in once only a fine centre line. You can then go over this with a pencil to make it more clear. Next, set out the position of the true ends of the longerons, where they join up to the front half of the fuselage, then put a line square across the table about 4 in. from one end. This will enable the longerons to be accurately placed in position when the time comes.

It will be well to pencil on this line, for the general information of all concerned, what it is for, to prevent mistakes. From this point, the distance to the centre line of each cross strut should next be marked, and when these are all done, put a square line across, cutting each point.

Next refer to the plan, and from that obtain the cross widths between the longerons at each cross strut. Carefully put a cut line at each end, this will enable you to set the longeron out accurately in plan on the table, and get the correct contour. (See Fig. 8.)

Laying On.

Having done this, lay on one longeron and clamp it to these marks; then the second; after which take a steel tape and accurately check all your distances in between the longerons at each strut, taking care to do this on the centre-line of each strut, and not at the side. The centre line may with advantage be marked in fine pencil on the longeron (cutting with a penknife in this case is not permissible).

Having adjusted any inaccuracies, small pieces of hard wood about 4 in. by 2 in. by 1 in. may be fixed down by means of glue and screws to the table, being gently pressed against the longeron until their position is definite, and the glue sufficiently set. When this has happened they can be further secured by means of a couple of screws.

The position of these distance pieces from either side of the centre line of the strut should be determined by the length of the

FUSELAGE JIG, & COMPLETE PORTION.

CONTRACTORS TO H.M. GOVERNMENT

steel fittings, and a small margin of, say, ¼ in. each side allowed for freedom.

Having fixed all these stops, hard wood turn-buttons should be fixed outside the longeron—(see Fig. 8)—to press it against the stops, when it is being finally fitted, not forgetting to use a piece of three-ply to prevent damage to the longeron. These turn-buttons are desirable on jigs, because they permit of quick release of longerons, struts, and other parts.

Steam Bending.

The bending of the longerons to fit the contour required by the jig will entail the use of a steam-bending plant, using low-pressure steam; preferably about 10 lbs. per square inch.

The steam-box should be long enough to take the whole of the longeron, for it is necessary to steam the whole longeron before bending. Care should be taken that the grain lies vertically when the bend is completed. If this process is not carried out crushing of the fibres will occur, and the strength destroyed.

The steam-bending plant must be close to the jig, for the value of steam-bending will be lost if the longeron is allowed to get cold on being taken out of the steam-box before it is put into the jig. The transference from steam-box to jig should be made as quickly as possible, and the longeron should be allowed to cool in position for a few hours.

Fitting Up.

Having got the longerons laid out on the jig table accurately in position, and all measurements carefully checked, the next thing to do will be to fit the steel fittings on to the struts, taking care in doing so that an equal amount is cut off each end of the strut, measured from the centre, especial care being taken to see that the strut beds accurately and squarely into the fitting. When this has been done the strut should be tested in between the limits of a "length jig" made up to represent a short length of fuselage —(see Fig. 9)—with a sliding adjustment, which can be locked to any required measurement or angle within limits.

A Length Jig.

This kind of jig will be found useful for checking many classes of work, and a few of varying lengths can be made with advantage. They can, of course, be elaborated to suit special requirements.

The strut and steel fittings having been tested for length and found correct, the strut should be tried in between the actual longerons for fit, and it should go in with a gentle pressure. When it is in its final correct position the bolt-holes in the fitting should be very carefully marked off on the longeron for drilling; this can be done with advantage by using a piece of steel exactly fitting the bolt-hole, about 4 in. long, and slightly countersunk, like a rivetsnap, and giving the piece of steel a few light taps to mark the longeron.

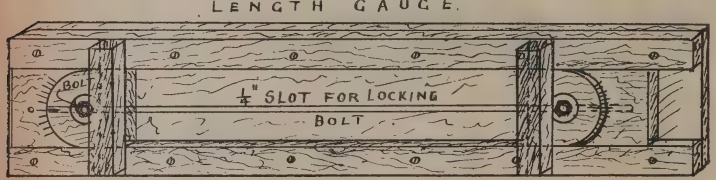

Fig. 9.

This having been done, pencil a distinguishing mark on the strut and on the longeron, so that it will be picked out again and put into the same place in the same fuselage. Preferably use a rubber stamp.

All struts will be fitted in this manner, and after this work is completed, each longeron should have the position of the fittings and the bolt holes marked out for the vertical strut fittings, after which the longerons should be taken out of the jig and the bolt holes drilled on a drilling machine with the aid of a metal plate jig clamped to the longeron to prevent the holes from being drilled out of centre. As no inaccuracies in bolt holes in woodwork are permissible, extra care must be taken with the drilling.

Getting Together.

All the various bolt holes being drilled, the longerons will at once be returned to the erecting shop. Here the longerons, being of spruce, should be neatly bound with ½-in. India tape, tightly laid on after the surface has been well covered with glue, and also the tape, each layer half overlapping the previous one and the end secured by a couple of ⅜ in. by 20 gauge brass gimp pins, after which all surplus glue may be removed with a damp rag. This binding is only required where the steel fittings are placed, and should extend about ½ in. either side.

The longeron will then be replaced in the jig and the final assembly of the rear bottom part of the fuselage will be commenced. It will be best to put in the shortest struts first and work forward, as this method will secure the ends of the longerons having the sharp curves fixed first, and also it will enable another couple of erectors to fit, glue, and screw down the three-ply at the rear end.

Simple Hints.

In bolting the fittings on, it is usual in seaplane work to give the bolts a coat of enamel, and tap them home, to dry in position, as the corrosion by salt water on steel fittings is very severe indeed. This helps to increase their life, and might as well be done in all aeroplanes. In tightening up bolts, it is well for erectors and others concerned to bear in mind that the size of the bolts they are handling are anything between ⅛ in. to 3/16 in. B.A. threads and ¼ in. and ⅜ in. B.S.F. threads, therefore it is not necessary to use a yard of 2-in. gas piping on the end of the spanner as a lever or to send for the "heavy gang" or millwrights, with 14 lb. slogging hammers, to drive the bolts home or lock up the nuts, as such methods are likely to smash the bolt or crush the head or nut into the soft wood. They would also put unnecessary strain on the bolt, and such methods do not find favour with the A.I.D. Also, incidentally, it may cause a man the trouble of having to look for a fresh job, besides proving that he is a B.F. (which stands for blithering fathead, and several other things).

Properly proportioned spanners and box spanners must be provided for the purpose. Tightening up of nuts with pliers and pincers damages the edges of the nuts and generally spoils what might otherwise be good work.

The nuts will now have to be made secure, and the method which now seems to be most universally adopted is to file the bolt down if necessary, until about 1-16th full is left projecting beyond the nut, and then to rivet this carefully over, taking care to hold a suitable piece of iron or steel bar at the back of the head whilst it is done. This riveting can best be done with a small ball-headed hammer weighing about ½ lb.

(To be continued.)

ONE POINT OF VIEW.

Just by way of showing that errors of judgment are not confined to Government establishments, the following letter, from a hand in an engine factory, is of interest:—

Sir,—As a weekly reader of your valuable paper, especially on the present output of aeroplane engines, I would like to ask you a few questions with regard to my present position. Being deeply interested in using my abilities, and to assist as much as possible, I gave up a situation as engine erector and fitter to assist another firm on the same work and the same engine, whose present output is far below normal. I took up my new position three or four months ago and find myself placed so—under a man as head foreman of fitting department, who never saw an aeroplane engine until eight months ago—"a gauge-maker by trade."

Take the following for example: a workman, who is not sure of what he is doing, asks advice, say, from me. I, having done the same work, tell him the best possible way out of the difficulty, and he goes on under my advice until he is seen by the aforesaid foreman. "Who told you to do so and so?" Workman: "Mr. So-and-so." "Well, don't do it. Do it this way." In nine cases out of ten the work turns out "scrap." The result is a replacement order. A new part—loss of time—output delayed, just for this simple matter.

One man can tell a good tale to the management, the other is a "British workman." Now, would you or any other person offer your information a second time after it being turned down? I think not. But I have done this over and over again.

When I say to a workman, "Ask the head man how to do it," ninety men out of the hundred we have in the shop will turn round and say, "I shall be as well off if I ask the errand boy." This is the class of men we have to contend with, yet we read in nearly every paper the great need for aeroplane engines.

Can you tell me the best possible way to go about the present position, as it is a source of worry to one who is deeply interested that our pilots should have no shortage either of engines or material?

[The way out seems to be, to ask for discharge papers and go to some other shop where the manager knows his job.—Ed.]

AERO-MOTORS
IN KIND AND CONSTRUCTION

By Geoffrey de Holden-Stone

Gobé-Diard Charge-Cycle.

At this stage, if anywhere, the closest examination of the sketch-drawing is needed, to see how the i.c. cycle is to work. Yet sufficient will be seen even so, to show that the extensions of the outer half of the crank-chamber, into which the cylinders are socketed, are like those of the Gnôme monosoupape, and of slightly larger diameter than the piston-sleeve, so that they can act as annular transfer passages. Also, that the cylinders have one set of induction ports at the bottom for an enriched mixture, and the crosshead caps another set, to draw air from the crank-chamber.

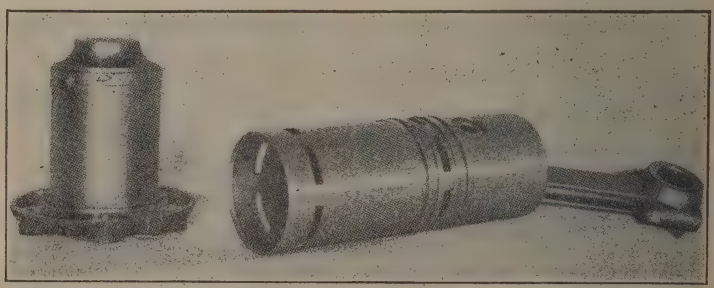
The piston, on the other hand, has a circle of square-cut ports above its head—which is really its bottom—for the inlet, and another set of oblong ports at the top of its sleeve-extension; which at full outstroke register with similar ports in the cylinder, for the exhaust to atmosphere.

Thus, at its instroke, the piston draws in the rich charge through the conduit between the outer and inner portions of the crank-chamber; this conduit being cut out during the outward or working stroke, when the inlet opening to the conduit ceases to register with the charge-feed port by the rotation of the motor-mass.

Then, of course, as the piston comes down, its underside compresses the primarily induced charge during the whole of the working stroke on its upper side; but to a *progressively increasing compression*, instead of to one or one and a half atmospheres only. But arriving at full outstroke—this action will be seen clearest on the lower part of the illustration—the compressed charge at once doubles round through the short annular transfer and into the ports around the upper side of the piston; thus incidentally helping to blow out the exhaust above.

The exhaust ports open earlier and close later than the inlets so the working chamber has plenty of time to fill with a well-relieved pressure: and so far from being wastefully scavenged, it will be obvious that only the completely burned gases at the top are driven out, any half-used remainder being churned up with the new charge.

Lubrication and Ignition.



Now, however, arise the questions, not only of lubrication, but the actual charge ignition of the Gobé-Diard. The former is less of a problem in this case than in such sleeve-motors as the Daimler S.K. and their like: for being a rotary, centrifugal action is sufficient to ensure adequate distribution all over the sleeve and cylinder surfaces: especially since the stationary induction trunk affords a convenient entry for the main-oil feed, and the hollow crank-shaft itself an adequate conduit.

The ignition scheme, on the other hand, is less readily perceptible. One might, of course, insert the plugs at the bottom of each pot-like head-piston. But the drawing shows no such indication; and furthermore it does not happen to be done in that way. The actual method is the more interesting, because it is also adopted perforce in other motors—especially one to be described later—of the type in which the piston acts as a sleeve-valve.

This way, then, is the insertion of the plug in the side of the cylinder, at a point opposite full-instroke and compression; where also an oval slot is cut in the sleeve, acting as a window through which the charge can be fired; the length of the slot allowing for full advance or retard. Here the subsequent advantage is that not only do the edges of the slot scour off any excess of lubricant, but the movement of the sleeve itself shields the plug points, and prevents the possibility of their fouling with any combustion products: however indifferent the carburation may be. Thus the chief cause of missed-firing and motor-failure occurring on switching-on after cutting-out the ignition is eliminated, and an additional link established with that reliability which is the first essential of any successful aero-motor.

The Firing Sequences.

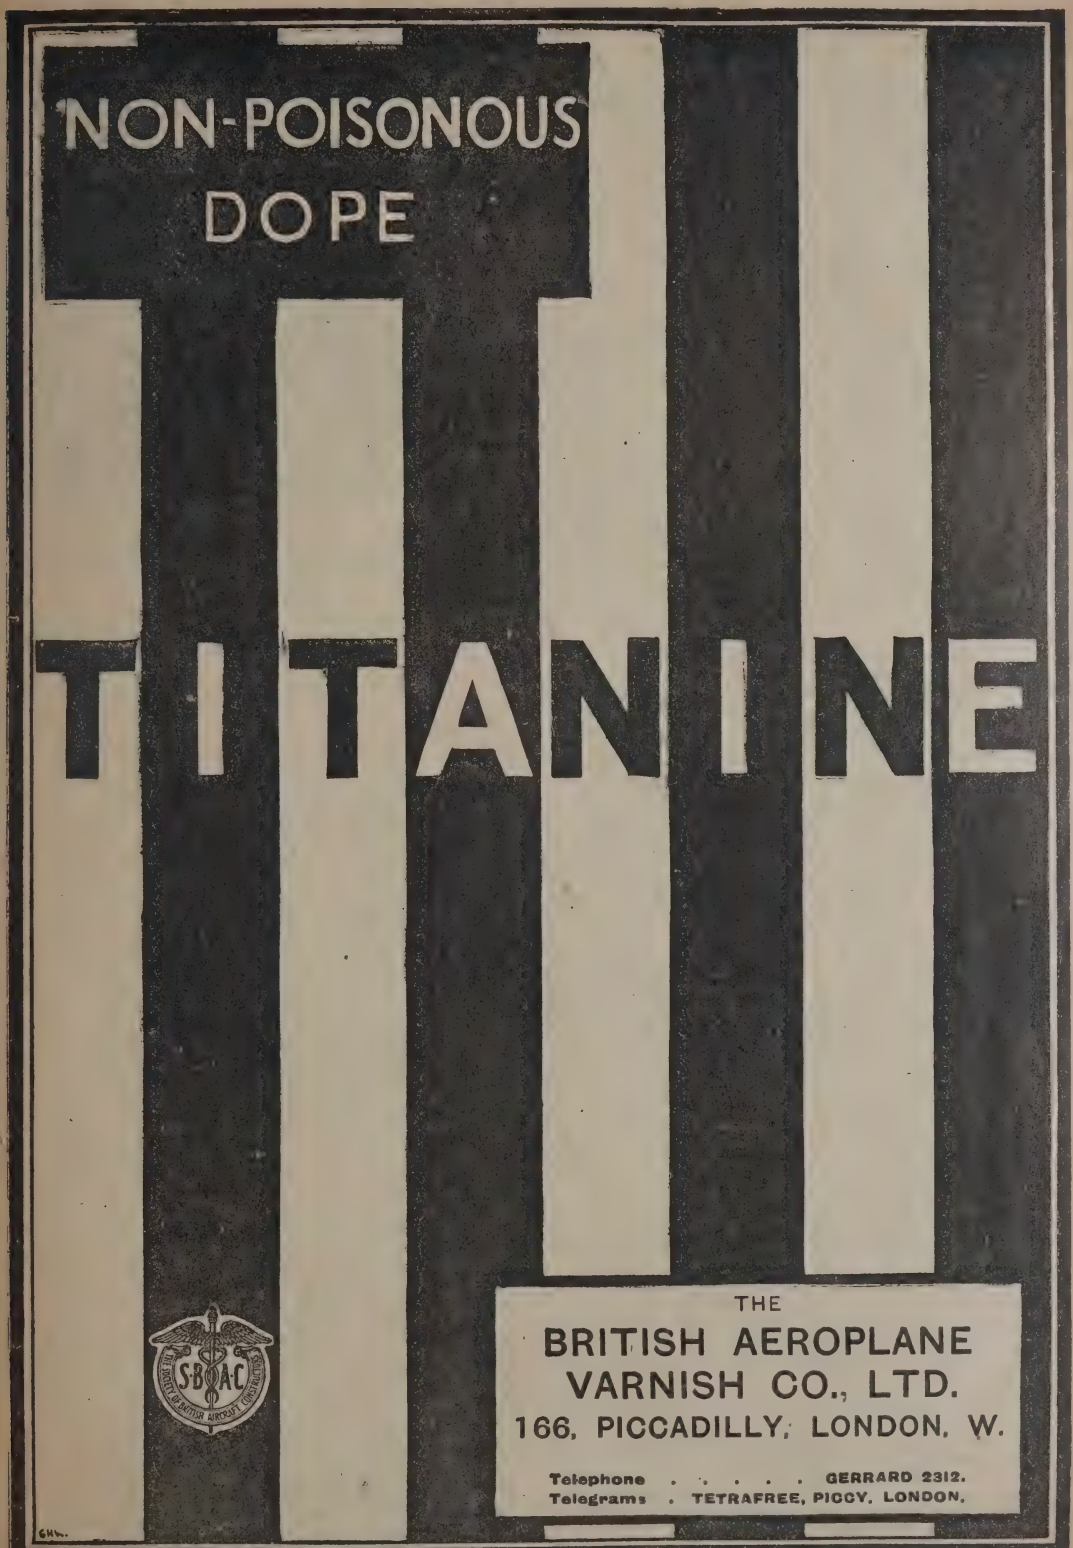
The ignition sequence in this case is somewhat curious, though simple enough when the working scheme of the motor is duly followed out. In the case of the 8-cylinder model as shown every other pair of cylinders is at right angles to the next pair. This being obviously so, it will be seen that the pistons of these alternates will be neither at full outstroke nor instroke, but in the midway position owing to the rotation of the motor as a whole. But the motor being of the two-stroke type, it follows that one cylinder of each pair must fire at every half-rotation. Also that one or other cylinder in the alternate pair will be due to fire—on the next quarter rotation—before the opposite one becomes due.

The R.C. Two-Stroke Marine Motor; the original Sleeve and Port Combination.

Consequently—taking the first pair as 12 and 6 o'clock, and the alternates as 3 and 9 o'clock—the firing order of the first four would seem to be 12, 3, 6 and 9. But as the crank-line shows the other four are at 45 degrees, as a set, to the first four. Otherwise we should have a double ignition at the quarter rotation—that is to say, in cylinders Nos. 1 and 5 at the same instant—which would hardly be helpful to a crank-shaft having only end-bearings, nor assist that continuity of rotative effort which naturally corresponds to crank-shaft torque in an ordinary motor.

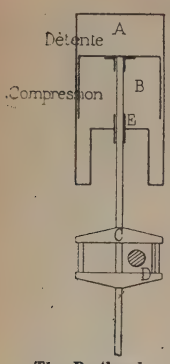
Actually, then, all these considerations demand an ignition at every eighth of a rotation, somewhere on the line. But here—with due reference to the pistons being in the right position—we have still to consider the old four-cylinder vertical's firing sequence of 1, 3, 4, 2; which leaves the last firing stroke on a middle crank.

So the actual firing sequence for the whole eight—beginning at the top as No. 1, and working round clockwise from four to four—becomes as 1, 5, 2, 6, 3, 4, 8, 7, and so to No. 1 again: the wiring consequently running to each in this order, but *serially* from the distributer plate.



In a 16-cylinder model—which would be quite a practical proposition with four rods to each crank, albeit with a longer crank-chamber—the sequence would run 1, 13, and so to 5, 10, then 6, 3, 11, and so on: the crank for each set of four being in the usual 90 degree relation, but the cylinders in each set staggered just 22.5 degrees from the next, forward or backward, to allow for the sixteenth interval between one working stroke and the next. Also the timing of the magnetos relatively would have to be effected with two 45-tooth spur pinions intermeshed; one of them 22½ teeth in advance of the other, for the same reasons.

Defects and Alternatives.



Nevertheless, the disadvantage of the Gobé-Diard is the outsized length between the cylinder tops. Unless the stroke is to be shortened and the cylinder diameter widened—a reversion to a passing fashion of design of a dozen years ago, and a very doubtful one in the case of a rotary aero-motor—a tremendously wide cowl would be needed to shroud the whole affair. Nothing is gained either, in kinetic effect, for naturally the circle of combustive effort does not extend beyond that area represented by the bottom of the head pistons.

On the other hand, the Berthaud motor—illustrated in working diagram and view of one sectional set on page 36—does appear to offer every advantage—including that of greater mechanical simplicity—that is possessed by the Gobé-Diard, without such excessive length between opposite cylinder crowns. Actually this length is no greater than it would be if the contained pistons were of the differential type, as in the Laviator, even taking the motor as it is, of the fixed radial or "star"-type.

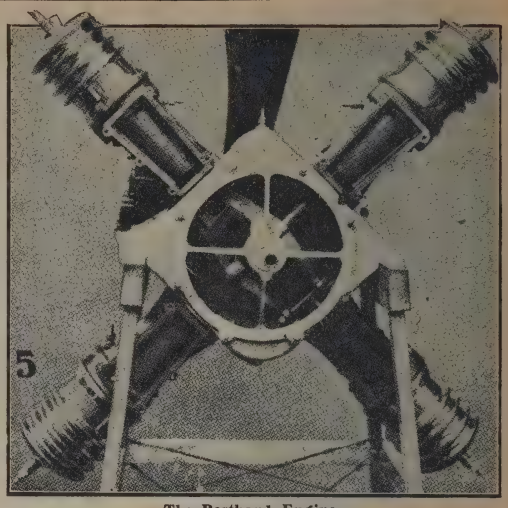
Yet clearly, if the eccentric crank-shaft mounting of the Gobé-

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

The Berthaud Schema.

Diard were embodied in its design, so as to give rotary mass-motion from fixed cranks, every inch of the length in the Berthaud would have its value in kinetic effect. For the combustion effort circle, being located at the cylinder extremities, would thus be at the full periphery of the mass in rotation.

How the Berthaud Works.



However the Berthaud motor as it is has its cylinders mounted in opposed pairs, each set of four to a common crank-pin, and the charge pumping primary induction, and compression cylinders, formed as shown, in tandem with the working ones.

The line diagram, again, shows the mechanical scheme to be of the simplest order, with this difference from most multi-cylinder two-stroke motors, that each cylinder is self-supplying, as an independent unit. For it will be seen that the *underside* of the long sleeved piston acts as a charge-pump with the minus pressure created by the instroke; which is relieved as soon as the bottom end of the sleeve uncovers the primary induction ports in the cylinder wall—located just below mid-length. These ports are immediately cut out as soon as the piston begins its outstroke, during which the induced charge is compressed upon the head of the stationary piston—clearly shown in the other illustration—and thence transferred upwards to the working or upper side of the piston through a series of inlet ports in the shouldered lower portion of the working cylinder; somewhat in the fashion of the Gnome monosoupape, but in a semi-circle only; the exhaust ports occupying the remainder of the circle at that point. Thus the motor is rendered valveless.

And the Mechanics Thereof.

To obtain this working result, of course, would be impossible with the ordinary connecting rod series, with its lateral movement. Yet the motor being fixed, the crank-shaft must be rotated. Consequently—and here comes in the chief mechanical novelty of the design—rigid piston-rods passing through glands in the stationary piston heads are connected to a box-type cross-head, in which the crank-pin slides to and fro as it rotates.

This construction and method of rod-connection, as used in the Berthaud may or may not be open to objection. If not altogether new—one seems to remember something of the kind at one of the lesser trade-shows in London—it can hardly have been tried

The Berthaud Engine.

sufficiently to be beyond all doubt of its wearing capabilities. The difficulty would obviously lie in its adjustment—at all events with more than a single set of four cylinders—to the same nicety as one expects to get with the crank-pin brasses and cotter-bolts of the conventional arrangement.

But on the other hand it may be said that it is easier to true up flat bronze slide-plates than it is to scrape brasses into a dead-cylindrical fit all over; and there is no reason to expect the friction to be worse on their areas than upon the probably larger areas of crank-pin brasses. So the consumption of lubricant should not be excessive at any rate, especially as distributed from the hollow crank-shaft. Whereas in a rotary with the Gobé-Diard crank-shaft mounting duly adopted, the commonplaces of practice would be justified, and if they gave no better result than the average, would certainly display no worse one. Altogether, the Berthaud design is one that appears to present many excellent possibilities, and more than the usual number of effective features as it stands.

(To be continued.)

WHITECRAFT.

Several years ago there lived witches and wizards in the land, and they enjoyed the reputation of being able to do strange things, such as healing the sick and converting stones and base metals into gold. Their machinations were known as witchcraft, and they inspired awe and terror in the minds of the lower classes. At times they were burned at the stake—but that was by the way. Witchcraft was usually associated with certain localities, and there were black and white witches and wizards. Some of the lighter grade were beloved by the poor and needy, for the good works with which they marked their footsteps, but, one and all, they were hated by the priesthood and others in high places, who attributed their works, good and bad, to the devil.

At the present time there has arisen in and around the parish of Richmond a cult which seems as if it must be a reincarnation of witchcraft on a higher plane.

This manifestation is known as Whitecraft, and it certainly possesses the wonderment of witchcraft, but the more sinister elements have naturally disappeared in the lapse of centuries.

Two years or so ago, in May of 1915, to be precise, Mr. J. A. Whitehead, fortified by considerable practical experience in various aircraft workshops, formed a small company at Richmond for the purpose of building aeroplanes.

A small wooden drill hall was acquired, and, with a miniature staff, the place was adapted to the needs of an aircraft works.

The organisation in all its branches was personally conducted by Mr. Whitehead, and his activities were difficult to describe.

A semi-comic, semi-tragic photograph exists of the early morning's work in Mr. Whitehead's office, where the managing director is shown successfully conducting half-a-dozen operations at once, including eating his breakfast, shaving himself, answering the telephone, dictating a letter, and receiving a telegram, with skill which only M. Paul Cinquevalli would attempt.

The success which this effort enjoyed was undoubtedy due in no small measure to Mr. Whitehead's striking personality and to the way in which he handled his employees.

As an experienced aircraftsman, he was able to take off his coat and show any erring workman how to perform any operation quickly and well, and he has always kept those who work for him well reminded that there is now a war on, and work to be done. The motto which crops up at all corners, "There's no fun like work," must have inspired many with enthusiasm for a hobby which is at once amusing and profitable.

Having thus demonstrated his manufacturing abilities, Mr. Whitehead was able to increase the capital of the company, and to build new works in 1916, which had the distinction of being opened by Sir Charles Cheers Wakefield, of Castrol fame, who was then Lord Mayor of London. A symbolical drawing, showing Sir Charles casting off flocks of Whitehead aeroplanes in the manner of a falconer, was used to adorn the programme of events, and attracted much comment at the time.

A large house was also acquired as a club for the firm's employees, and forthwith it became known as the Whitecraft Club. This institution was intended to make things more easy for employees. Run on a self-supporting basis, the Club is as dear to its old members as the Pickwick Club in Dickens' days.

Alongside the Club is an enormous canteen, whose construction was hung up by the local authorities for many weeks on aesthetic grounds, where well-cooked meals are served, under hygienic conditions, at a most moderate price. Like everything else, the catering is done at home, and when the price of meat became a problem, the firm acquired a butcher's shop in Richmond in order that wholesale prices might be obtained!

Of late, Whitehead enterprise, to quote the late Mr. Sam Weller, has been "wisibly swellin'," and extensions have been made in all directions. A large park in the vicinity of Richmond has been acquired, and workshops are in full working order. An enormous aerodrome is being levelled out, and it is hoped in the future to convert the mansion, which is at present being used as a military hospital, into a club-house.

Of the work that is in progress it is naturally indiscreet to speak. One can merely say that it reflects the man.

Mr. Whitehead fully appreciates the uses to which women can be put in aircraft factories, and large numbers are employed, many of them upon operations of great delicacy.

Mr. Whitehead at home is typical of Whitecraft. He at present occupies Buccleugh House, Richmond, where he preaches the gospel of a big air fleet and the possibilities of commercial aviation in a way which the multitude can understand.

IVORINE OR METAL CAPACITY AND INSTRUCTION PLATES BY RETURN

MARKET REPORTS.

Prices given are for quantities on usual terms.

COPPER.—The market is very quiet indeed. Of course all dealings are entirely under official control, with the consequent elimination of nearly all merchant business. Supplies are very regular and there is every indication that future demands for war purposes will be easily met.

Current Prices.

Copper Ingot (Standard) Cash...£130 per ton.
Copper Sheet .....£165 per ton.
Copper Tube .....20½d. per lb.
Brass Sheet, 24 G. .....16⅛ per lb.
Brass Tube, S.D. .....17d. per lb.

TIN.—There is still a very uncertain tone about this market. The fluctuations during the last few weeks have been very erratic and are worth recording (see below). The recent advance approached £250 and then collapsed, a sharp decline bringing the price down to £242 (29.6.17). Good supplies have recently been received from the States and orders are fairly well covered.

June 4th. 6th. 8th. 11th. 13th. 15th 18th. 20th.
£239. £237. £238. £236. £236. £240⅜. £249. £246
June 22nd. 26th.
£246. £242.

LEAD.—The position is still unaltered, and supplies are very scarce. There is a very strong feeling that the present difficulties have been created by incapable officials. Official prices are unaltered, being £29 10s. to £30 10s. per ton.

STEEL.—Prices are very steady and a reduction is very unlikely. Before any business can be done with U.S.A., there must be a substantial reduction in prices. In view of the unprecedented congested condition of all mills, consumers are looking well ahead and considering the unlikelihood of a decline in prices. This is certainly a very wise procedure. There is a very acute shortage of Tool Steels, and there is no indication that an improvement is in sight.

Current Average Prices.

R.A.F. 3B Steel, 38s. to 40s. per cwt. Basis.
R.A.F. 1E Steel, 78s. to 80s. per cwt. Basis.
R.A.F. 9A Steel, 32s. to 33s. per cwt.

ALUMINIUM.—This market still remains unaltered.

Current Official Prices.

Ingot £225
Remelted ... ... £210 ...

TIMBER.—The demand for aircraft timbers, in common with other aero materials, is rapidly increasing, but unfortunately supplies do not show any improvement. The Admiralty is now in a position to supply constructors with Silver Spruce, Walnut, and Mahogany, at the following prices:—

Silver Spruce, £85 per standard.
Propeller Walnut, 2s. 3d. s.ft. to 2s. 6d. s.ft.
Propeller Mahogany, 1s. 9d. s.ft. to 2s. s.ft.

One is surprised to learn that firms are expected to take the wood without inspection, especially considering the unfavourable report received of the quality of the timber imported. One is strongly of the opinion that this stipulation must be withdrawn.

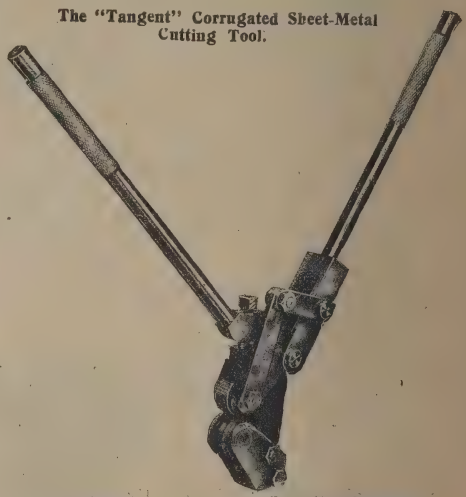
Current Prices.

Silver Spruce, 17s. c.f.
English Ash, 13s. 6d. to 15s. c.f.
Walnut, 2s. 3d. to 2s. 6d. s.f.
Mahogany, 2s. 2d. to 2s. 4d. s.f.

FABRIC.—There is very little to report. Supplies are now coming through more rapidly. There was a delay a few weeks ago due to the weavers turning out more cloth than the bleachers could deal with; apparently our official experts had increased the number of weavers working on aircraft fabrics, but overlooked the bleachers, and a state of congestion followed when the fabric reached the latter.

Prices are unaltered.

Official Prices (reported).



17C Cloth, 29½d. per yard, 36 in. wide.
17C Cloth, 31d. per yard, 38 in. wide.

SHEET METAL CUTTING.

Now that so much sheet metal is used in aeroplane work, aircraft constructors will welcome a device which will assist its ready manipulation. A clever range of sheet metal cutting tools has been produced by Montgomery, Smith and Co., Ltd., of Tangent Works, Keynsham, Somerset.

The ordinary sheet metal cutting hand shears and bench shears of the scissor type have possessed the merit of simplicity, but they had the disadvantage that the expenditure of considerable power was required in proportion to the work done, and the long blades of the shears are a source of annoyance when complicated cutting is undertaken.

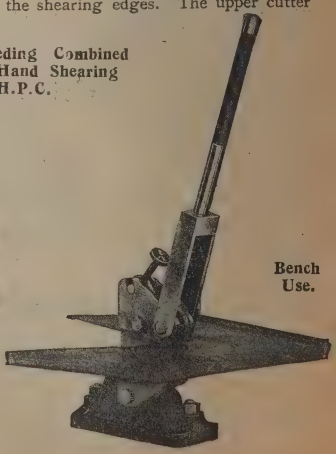
The "Tangent" Corrugated Sheet-Metal Cutting Tool.

Type C.C.B. **Capacity 18 gauge.**

The range of sheet cutting tools manufactured by Montgomery, Smith and Co., Ltd., is known as the "Tangent" series, and the various models are designed for differing work.

Type H.P.C. is a small tool capable of cutting sheet steel up to 3/32 in., and softer metals up to ⅛ in. Two patterns are made, one intended for the bench, and the other for purely hand work. As a matter of fact, the hand model can be converted into a bench tool in a few minutes.

The tool comprises a pair of rotary double-edged cutters, serrated or knurled round the shearing edges. The upper cutter



The "Tangent" Corrugated Cutter. Type C.C.A.

The "Tangent" Self-Feeding Combined Portable and Bench Hand Shearing Tool. Type H.P.C.

Hand Use.

Bench Use.

AERONAUTICAL AND
GENERAL ENGINEERS

South Lodge Motor Factory
WEYBRIDGE

Telephones WEYBRIDGE 550 (7 lines), Telegrams: "MERCEDES, WEYBRIDGE."

is driven by means of an internal ratchet by operating the forked handle backwards and forwards. The tool is self-feeding, and the cut can be stopped at any point across the sheet.

Type B.C.H. is constructed on similar principles to type H.P.C., but is of much heavier and stronger design and has compound variable leverage. This tool will cut steel up to 3/16 in. thickness and softer metals up to ¼ in.

A slightly differing range of tools has been produced, but constructed upon very similar principles, which are designed to cut corrugated iron in a straight line, on a curve, or obliquely across the sheet without distortion. The heavier models of this pattern are also arranged with compound leverage.

Complete information about the devices is contained in an illustrated leaflet issued by the firm, and those interested are recommended to apply for a copy, mentioning THE AEROPLANE.

THE PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by THE AEROPLANE from the current Official Patents Records.

PATENT APPLICATIONS.

Abbott, G. Toy flying machines, etc. No. 9067. June 23rd.
Adams, J. A. Device for detecting inclination of aircraft. No. 8816. June 19th.
Aeronautical Instrument Co. Balloons. No. 9054. June 23rd.

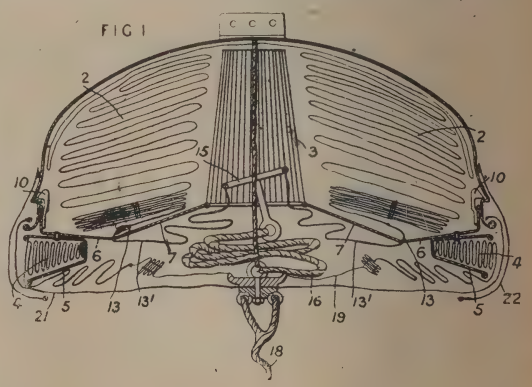
COMPLETE SPECIFICATIONS ACCEPTED, PRINTS OF WHICH ARE OBTAINABLE ON AND AFTER JULY 12TH, 1917.

107,050. June 12th, 1916. Sloper, T. Pneumatic cushioning-devices for aircraft.
107,099. July 17th, 1916. Wilson, T. E. C. Flying machines.

ABRIDGMENTS OF RECENTLY PUBLISHED SPECIFICATIONS.



105,816. Aircraft. SAUNT, W. F., Lundy Island, North Devon.

PROPELLING; STEERING.—An aerial machine of the kind described in Specification 14862/15 has (1) means for varying the angle which the inclined extension makes with the main driving-shaft, (2) means for varying the angle of incidence of the wing, and (3) means for varying the opening and closing movement of the wing, all controlled from a single hand-lever capable of three motions., (1) The main driving-shaft B of each wing is supported in bearings E, F, and the two shafts have worm-wheels C driven from a common worm D. The extension H working inside the hollow humerus of the wing is pivoted to G and has two arms K, L connected to a cord M which passes into a hollow in the shaft B and over a pulley N. One point of the cord is connected to a pin N^1 passing through a slot in the shaft B to a sleeve O adapted to slide on the shaft. The sleeve O turns in a sleeve adapted to be moved by a forked lever S so as to vary the inclination of the extension H. Separate sleeves adapted to be moved in opposite directions may be connected to separate cords M instead of forming the cord into a loop, and one of the sleeves may be inside the shaft. (2) The gimbal mounting of the humerus is carried by a ring 1 adapted to turn on a bracket 3 fixed to the body. A rod connects the lower fork of the humerus to an adjustable slide on the body, this arrangement producing an independent cyclical variation of incidence. According to the Provisional Specification, the rod may be connected directly to the ring 1, in which case there is no cyclical variation of incidence. (3) A rod 7 connects an extension of the ulna of the wing to a slide 8, or two cords connected to the ulna at opposite sides of its pivot may be used. The controls (2) and (3) are available when the machine is used as an aeroplane, the shaft H under these circumstances being turned into alignment with the shaft B so that the wing is not affected by rotation of the shaft. The three controls are operated by the lever device shown in Fig. 6. A lever 9 universally jointed at its lower end is connected at 13 to horizontal lateral and longitudinal cords led respectively to the pivoted lever S and slide 8 of controls (1) and (3). A lever 18 having a handle 19 is pivoted to the upper end of the lever 9 and operates a vertical cord 16 led to the adjustable slide of control (2) either directly or through multiplying-gear acting on a leading-screw and nut. The above described controls may be used in conjunction with the tail control described in Specification 102,915.

105,944. Parachutes. CALTHROP, E. R., Eldon Street House, Eldon Street, London.

In order to ensure the opening of a parachute, such as that described in Specification 21312/14, an auxiliary parachute is arranged to open first and thus to collect and conduct air into the main parachute. In the form shown, the main parachute 2 is folded within a container 1, being arranged around a cage or support 3 connected by spokes 7 to an annular plate 6, which carries an annular member 5 for housing the auxiliary parachute 4, and is secured to the container 1 by pawls 10. The apex of the auxiliary parachute is attached to the member 5, which thus constitutes a central opening. The rigging 13, 13^1 of the main parachute is attached to the plate 6 and connected by a centre-piece 15 and rope 16 to the main suspension rope 18 secured to the aviator; the rigging 19 of the auxiliary parachute is connected also to the rope 18. Covers 21, 22 enclose the apparatus. When the load comes on the rope 18, the cover 21 is stripped off and the auxiliary parachute is opened, after which the pawls 10 are pulled out of engagement, thus releasing the cage 3 from the container 1 and unfolding the main parachute, which receives the air entrapped in the auxiliary parachute.

(*Continued from page 26.*)

ROBERTSON.—Lt. John Ross Robertson, Yeo., attached R.F.C., youngest son of Sir William and Lady Robertson, Dunfermline, was killed in action on May 12th.

SHEEHAN.—Capt. D. D. Sheehan, Nationalist M.P. for Mid Cork, has been notified that his son, Lt. D. J. Sheehan, R.F.C., previously reported missing, is now unofficially reported as dead.

STACEY.—Sec. Lieut. Douglas W. Stacey, R.F.C., who died of wounds on June 20th at the New Zealand Stationary Hospital, was the youngest son of the late John E. Stacey, of Dorset, and Mrs. Stacey, of 4, Glendower Place, S.W. He was born at Sherborne in 1885, and was educated at Merchant Taylors' School, London. For the last 10 years he had been gold-mining in Rhodesia, four of them in tributing the "Godwin" mine. He came to England last year to volunteer for the R.F.C., and proceeded to France on May 30th of this year.

SULMAN.—Sec. Lieut. Geoffrey Sulman, R.F.C. (temporary instructor), died on June 20th, at the Military Hospital, Lincoln, as the result of an accident. He was the eldest son of John and Annie E. Sulman, Sydney, Australia, and was aged 23 years.

* * *

A letter from his squadron commander states that Lieut. John William Shaw, R.F.C., is a prisoner in the hands of the Germans. Mr. Shaw was officially reported missing after a flight over the German lines during the capture of the Messines Ridge on June 7th, and he was last seen engaged in a fight with two enemy machines. Mr. Shaw is a well-known oarsman. He rowed for the Marlow R.C. from 1909 to 1914, and was in the eight which did so well at Henley in 1913 and 1914.

ENGAGEMENTS.

HALL—WELLS-COLE.—A wedding will shortly take place between Capt. G. H. Hall, Yeomanry and R.F.C., eldest son of Sir Henry Hall, I.S.O., and Lady Hall, of Chester, and Miss M. G. Wells-Cole, younger daughter of the late G. F. Wells-Cole and Mrs. Wells-Cole, of Stanes Place, Lincoln.

JENSEN—PALMER.—An engagement is announced between Lt. J. Jensen, R.F.C., only son of Mr. J. Jensen, of Westerham, Kent, and Gwynifrid Barrington, eldest daughter of Mr. and Mrs. T. H. B. Palmer, of 1, Sutton Court, Chiswick, late of The Ivy House, Bushey.

LITHGOW-BALFOUR.—An engagement is announced between Major Ernest Lithgow, R.A.M.C. and R.F.C., eldest son of Dr. T. G. Lithgow, of Farnborough, and grandson of the late Colonel the Hon. Ernest Curzon, 52nd, Oxfordshire, Light Infantry, son of the first Earl Howe, and Doris, elder daughter of Colonel A. M. Balfour, D.S.O., R.F.A., and Mrs. Balfour, of The Close, Tetbury, Gloucestershire.

MARRIAGES.

BAILLIE—ALLAN.—On June 30th, 1917, by special licence, at Regent Square Presbyterian Church, Lieut. Archibald Baillie, R.F.C., late of the Black Watch, elder son of Mr. and Mrs. John Baillie, of Glasgow, was married to Ann, elder daughter of Mr. and Mrs. Henry Allan, of 31, Clerkenwell Green, London, by the Rev. Ivor J. Robertson, M.A.

COX—WARNER.—On June 23rd, at St. Andrew's Church, Westminster, Major G. H. Cox, North Staffs. Regt. and R.F.C., was married to Eileen, youngest daughter of Mr. and Mrs. Aucher Warner, 193, Ashley Gardens, S.W.

DE COURCY—WRIGHT.—On June 21st, at Holy Trinity Church, Sloane Street, by special licence, Capt. John Arthur Gerald de Courcy, R.F.C., M.C., Croix de Guerre, only son of the Hon. R. C. S. and Mrs. de Courcy, of Waipukurau, N.Z., and Exeter (and nephew of the Hon. Mrs. Millar, Killarney Wood, Bray, Wicklow), was married to Anna Felicia, youngest daughter of the late Mr. Justice Wright and Mrs. Wright, of Rycroft, Bray, Co. Wicklow.

FULLER—FULTON.—The marriage took place on July 2nd, at Holy Trinity Church, Sloane Street, of Capt. Charles Drury Fuller, Royal Sussex Regt., and R.F.C., son of Mr. and Mrs. Herbert Fuller, 31, Palace Court, W., and Miss Beatrice Fulton, daughter of Sir Robert and Lady Fulton, of 7, Sloane Gardens, S.W. The bride was given away by her father. Miss Manson and Miss Mathew (cousins of the bride) were bridesmaids, and Miss Diana Skimming (niece of the bridegroom) carried the bride's train. Capt. N. B. Fuller, brother of the bridegroom, was best man.

GILLING—CHAPMAN.—On June 23rd, at St. Michael's, Golder's Green, N.W., Capt. A. C. Gilling, R.F.C., was married to Marjorie Gillam, only daughter of Mr. and Mrs. H. Chapman, Lillington, Ambrose Avenue, N.W., by the Rev. V. Keelan.

STEEL—HENDERSON.—On June 28th, Sec. Lieut. Graham Strang Steel, R.F.C., only son of the late Thomas Steel, was married, by special licence, at St. Bartholomew's Church, Southsea, by the Rev. S. C. Lowry, to Marion Chalmers, only daughter of the Rev. James Henderson, 26, Victoria Grove, Southsea.

WILKES—HEWITT.—On July 1st, at St. Mary Magdalene's, Wandsworth Common, S.W., Sec. Lieut. Henry James Trevor, R.F.C., elder son of Mr. and Mrs. William H. W. Wilkes, of Belmont, Kidderminster, was married to Doris Margaret, only daughter of Mr. and Mrs. Alfred Hewitt, of Lena Lodge, Balham Park Road, S.W., by the Rev. C. V. Rowe.

BIRTH.

TIZARD.—On June 25th, at Portland House, Woodbridge, the wife of Capt. H. T. Tizard, of a son.

Capt. T. Davidson, Cameron Highrs. and R.F.C., has been missing since June 19th. News of him will be gratefully received by his sister, 14, Melville Street, Edinburgh.

* * *

It is reported that Sec. Lt. M. Kaiser, R.F.C., is a prisoner in Germany. Mr. Kaiser is a son of the headmaster of the Jews' Hospital and Orphan Asylum.

* * *

It has been arranged that Brigadier-General L. E. O. Charlton, R.F.C., is to open on July 4th (to-day) a hostel provided by the Eccentric Club for disabled soldiers, as a memorial to the late Captain Ball, V.C.

It is in Mare Street, Hackney, and among those attending the ceremony are Alderman Ball, the Mayor of Nottingham, the Recorder of Nottingham, Sir A. Griffith-Boscawen (of the Pensions Ministry), Sir Charles and Lady Wyndham, Sir Frederick Milner, and many other distinguished people.

The members of the Eccentric Club have subscribed over £10,000 for the Captain Ball hostel and three similar places designed for the benefit of discharged disabled soldiers who are attending courses of instruction at the various polytechnics and technical institutions in London.

* * *

As a result of Miss Helen Morris's matinée at Wyndham's Theatre on June 19th, a cheque for £400 has been handed to Lady Henderson to provide comforts for the R.F.C. in the Near East.

FRANCE.

OFFICIAL COMMUNIQUÉS.

JUNE 26th.—ARMY OF THE ORIENT.—The Allied aviators successfully bombed numerous enemy camps.

JUNE 27th.—Yesterday, about 8 p.m., German aircraft dropped several bombs on Nancy. There were no casualties, and no material damage was done.

JUNE 28th.—A German aeroplane, brought down by one of ours, fell to the south of the Bois de Beau Marais, south of Craonne. The pilot, who was wounded, and the observer, who was unhurt, were captured.

The Germans continue to bombard Reims, which to-day received 1,200 shells. Eight fell on the Cathedral.

It is confirmed that on June 25th an Albatros attacked by one of our aeroplanes fell into its own lines east of Gratreuil. Yesterday an Albatros was brought down south-east of Moronvillers.

JUNE 29th.—ARMY OF THE ORIENT.—British aviators caused big explosions and fires at Sovjak, near Demirhissar, and among the sheds at Bogdand.

* * *

Sous-Lt. Dorme, the famous French pilot, who received the Legion of Honour, the Medaille Militaire, and the Croix de Guerre, for bringing down 23 German aeroplanes, is officially reported as missing.

* * *

Lieutenant-Aviateur James Hall, author of the popular volume, "Kitchener's Mob," is reported to have been killed on the French front during an encounter with several German aeroplanes. He was born in Boston, Mass., and was a member of the American Lafayette Escadrille.

GERMANY.

OFFICIAL COMMUNIQUÉ.

JUNE 29th.—Yesterday, the flying camp at St. Denis Westrem, near Ghent, was bombed.

* * *

A semi-official telegram of June 30th from Berlin states that the German Press, referring to the British and French indignation at the air attack on the "fortress" of London, says:—

If England wants to spare civilians she can remove them from the immediate neighbourhood of storing places for war requirements. Folkestone, Dover, Sheerness, and London are such storing places.

The German people, under the pressure of England's starvation war, have become a hard race with an iron fist. England has felt this, and will experience it again to-morrow. England may lie, deceive, threaten. The hammer in our fist will fall unmercifully and shatter places where England forges her weapons against us. So it shall certainly be.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

A participant in the recent aeroplane raid on London contributes to the "Frankfurter Zeitung" a graphic story of the expedition. After describing the journey out, he says :—

Now it is a straight course for London. The first shots of the anti-aircraft guns reach our height, but don't disturb us. The firing having been passed, our squadron closes up. On the left is the Thames, whose bends we follow carefully on the map.

At last, surprisingly clear and distinct, so that everything can be recognised, London's sea of houses beneath us. Our first greetings drop in quick succession—more still more. Then we proceed, coolly and calmly, passing over the suburbs, for it is the centre we must hit. We regard nothing but that one object. There are the Tower, Liverpool Street Station, the Bank of England, Admiralty ships on the Thames—all are absolutely clear. Everything is before us. Now is the moment. I press the bomb-release handle and follow intently the course of the greetings of the German people to the English. They are plentiful, blow after blow bursting bombs in the heart of England.

[On this point the "Vorwärts" (the Socialist organ) says :—

"It is necessary to remark that the writer of this article discharged a military order but no political mission from the German to the English people. A military action in which, unfortunately, non-combatants and women and children also lost their lives, cannot suitably be described as greetings from the German to the English people."]

A wonderfully impressive sight. Over the centre of London, high up between us, the bursting shells of batteries; down below exploding bombs, clouds of smoke and fires. Over us all the smiling sky. The squadron turns. A last glance at the city—auf Wiedersehen!

Describing the return journey, the writer relates how he was attacked by British fliers. After boasting that he beat off two opponents, he says :—

Then comes the third, who is an obstinate, clever fellow. For ten minutes we exchange shots. He makes a sudden bitter attack, and we are hit in the wings. Then the enemy machine rockets down into the depths, the first enemy beaten on England's island. Then we are over the coast. To the right is an enemy flier, whom, from his tactics, I recognise as a trained flier of the Somme battles. Perhaps we had previously met each other. We are ready. Here he is. Suddenly he makes a turn to the left, in a flash is twenty metres nearer, and in a moment both machine-guns are at work—thirty seconds only, for a fight which was short and sharp—a meeting of old friends of last summer. We recognise each other.

* * *

It is reported that Lieut. Allmenröder, a member of Capt. von Richthofen's "travelling circus," has been killed while fighting on the Western front.

Lieut. Allmenröder was first officially mentioned on May 26th, when he was credited with having brought down two enemy machines and thus achieved his 19th and 20th victories. His last appearance in the reports of German Main Headquarters was on June 6th, when he was said to have again secured a double victory, and to have brought up the number of enemy machines accounted for by him to 26.

* * *

The "Frankfurter Zeitung" reports the death of the German aviator Riessinger, who had, before he met his fate, shot down four enemy machines.

The report adds that during his last fight he succeeded in setting fire to the machine of his British opponent, but the latter, seeing that he was unable to escape death, rammed Riessinger's machine, with the result that both aviators fell to the ground.

AUSTRIA.

Official Communiqué.

June 30th.—Enemy aviators dropped several bombs in the vicinity of Trieste.

ITALY.

Official Communiqués.

June 26th.—Aircraft were very active yesterday. One enemy machine was brought down by battery fire and fell within its own lines north of Asiago.

During the night our aircraft bombed the military works at Nebrasina and Prosecco. All the machines returned safely.

June 29th.—Enemy aviators displayed great activity during the evening. They were effectively engaged by our anti-aircraft batteries.

July 1st.—It is announced that on the night of June 29th a squadron of enemy aeroplanes, coming from the sea and flying at a great height, dropped incendiary and high explosive bombs on the lagoon of Venice, on the city itself, on Murano, and Chioggia.

Fortunately there were no casualties. The raiders made off under a heavy fire from our anti-aircraft batteries, and it is believed that two of the machines were hit.

Reprisal measures were promptly taken, and on Saturday night our seaplanes attacked the industrial zone of the town of Trieste. The attack was carried out in spite of a heavy storm which had suddenly sprung up and a heavy fire of the enemy batteries.

All our machines returned to their bases.

* * *

A message from Naples reports that the first aeroplane with mails for Sicily left there that morning at 6.24, and arrived at Palermo at 9.25. It was to return that evening to Naples with mails from Sicily.

* * *

There has been on view at Padua for the benefit of the Soldiers' Clubs, that Austrian seaplane which wrought such havoc on the city in Nov. last and caused more than 100 deaths.

The machine (K.301), which has a fearsome history of misdoing—being responsible, too, for the damage to the basilica at Aquileia—was brought down in Grado lagoon. She is a fine speciman of current Austrian practice, spans 21 metres, and has a 12-cylinder 300-h.p. engine. The length of the boat-body is 12½ metres by 1½ metres beam, and it is judged by those who ought to know that the machine could carry a useful load of close on a thousand pounds. A regular naval engagement took place over the possession of the wreck, so probably our Allies have got a good thing.

INDIA.

June 30th.—A statement communicated by the Secretary of State for India, referring to the rising on the North-West Frontier, says :—

Our aeroplanes raided Makin and Marobi with considerable effect.

TURKEY.

Official Communiqués.

June 26th (apropos action between the "Breslau" and Russian Naval Squadron).—One of our seaplanes dropped bombs with effect on some of the enemy ships of the line . . . Finally, the portion of our naval forces in question, as well as our aeroplanes, returned without having suffered any damage.

June 29th.—Three enemy machines which attacked Jerusalem on June 26th (? were brought down). Our reconnoitring patrols, which were approaching two of these machines, having again been attacked by enemy aeroplanes, captured the machine-guns of these aeroplanes and burnt the machines.

The British have lost six aeroplanes, two in air fights and four by our artillery fire. The activity of our aviators on the Sinai front is worthy of admiration, and deserves to be recorded.

GREECE.

A message from Salonika on June 23rd states that an unusual number of air reconnaissances by single machines have been made lately, the enemy taking advantage of the mists which are frequent at this season of the year.

SWEDEN.

A message from Ystad states that on June 2nd two Zeppelins violated Swedish territorial rights. They approached from the East, and were only two nautical miles from the shore when the Swedish destroyer "Pollux"—the vessel which last year, with her guns ready for action, drove off some German submarines which were trying to seize a British steamer within the territorial limit—opened fire on them with guns and rifles. The airships made for the open sea, the crowds which witnessed the incident cheering as they departed. A Zeppelin has also travelled over Swedish territory at Simrishamn.

It is reported, in connection with this incident and with the recent attack on a Swedish aviator by some German seaplanes, that the coast of Scania for some time has been systematically patrolled by the Germans, who, it is stated, are looking for some British steamers which they expect to intercept when they leave the Baltic.

The "Aftontidningen" declares that the next step will probably be the taking by Germans from the air of Swedish life on Swedish soil.

"Aftonbladet," a journal with strong pro-German tendencies, says :—Germany is again giving our people cause for resentment. The attack on one of our aviators is a serious breach of international law from more than one point of view, and we must emphasise the point that Sweden does not intend to refrain from asserting its rights as a neutral State, according to international law, and that it will not be satisfied merely with the explanation that when navigating in the air mistakes are easily made.

The paper further points to the fact that Germany is the only belligerent Power which during the present war has been guilty of shedding the blood of innocent Swedes.

DENMARK.

The special correspondent of the "Morning Post," writing from Copenhagen on June 4th, says :—

The brutality of the methods employed by Germans against neutral ships was emphasised to-day in the Maritime Court by the crew of the Danish steamer "Odense." The crew stated that the vessel had called at a British port for inspection, and was proceeding on her voyage, when, on May 5th, a torpedo was suddenly fired at her. The torpedo missed its mark, whereupon a German submarine appeared and opened fire. The crew took to the boats, but the submarine continued to shell the steamer

and the boats for twenty minutes. The "Odense" was hit thirty times, while, of the men in the boats, two were killed and two seriously wounded. The vessel and her crew were saved by a British seaplane, the appearance of which caused the submarine immediately to submerge.

U.S.A.

The report of the duration and distance traversed by the aeroplanes with General Pershing in Mexico has just been published.

From July 1st to Dec. 31st, 1916, the machines of this unit carried mail on one trip in each direction between Colonia Dublan, Mexico, and Columbus, New Mexico, without missing a trip. The average time for this 110 miles was 66 minutes, and the machines were forced to rise to an altitude of 4,100 ft. above Columbus and 8,200 ft. above sea level. The total flights for this unit from Jan. 1st to Dec. 26th were 7,087. The machines were in the air for a total of 3,356 hours, and travelled a total of 251,775 miles. Of fatalities there were none.

* * *

Details of the trial flights of DN—1, the first United States Army airship, which is the product of the Connecticut Aircraft Company of New Haven, Conn., have been received. The flights were made at Pensacola, Florida.

Leaving the floating hangar at the aeronautic station at 5.0 o'clock on April 20th, the DN-1 ascended to a thousand feet altitude, headed across the bay, sailed over Santa Rosa Island, circled over Pensacola, and returned to the yard.

The trial flight, which was made by the company's pilot, Hans O. Stagel, and crew, was to test buoyancy, speed, and ascertain a number of technical points.

Two landings on water were made and ascent and descent were accomplished by ballonette steering, no gas being lost from bag to make descent.

Rebuilt several times, the DN-1 in its present form was produced under direction of Mr. C. F. Smyth, general manager of the company, who took hold of the management of the company's affairs last July.

The DN-1 reached Pensacola last December, and work of assembling and erection was begun in January, under the supervision of General Manager Smyth, and the company's pilot, Hans O. Stagel, was placed in charge of the work. Its capacity is eight men.

* * *

An unofficial trial of the first of 16 non-rigid airship coast scouts ordered by the Government from a design by Naval Constructor J. C. Hunsaker, of the Bureau of Construction and Repair, has recently successfully been made. It consisted of a flight of about 400 miles between Chicago and Akron, O.

The news leads the Navy Department to expect to have the entire 16 airships at work along the Atlantic coast by the middle of August. Crews for their operation are being trained at the naval aeronautical station at Pensacola, Fla. An older type of airship is being used for the purpose.

The airships are built after the British "Blimp," which has proved of value in the detection of submarines while approaching the English coast. The American airships will be operated in pairs from special bases ashore, and will be expected to serve as the "eyes" for submarine chasers. They will be fitted with wireless.

The Government gave out contracts for the building of nine of these airships by the Goodyear Rubber Company, and seven others are being turned out by the Goodrich Rubber Company, the Curtiss Aircraft Company, and the Connecticut Aircraft Company.

The trial was made by the first product of the Goodyear Company. The Government specifications are for a speed of forty miles an hour. About thirty miles an hour was made.

* * *

It is reported that the production of the Hispano-Suiza 8-cylinder aviation engine has now reached about 10 a week at the Wright-Martin factory in New Brunswick, N.J., the old Simplex plant. It is expected that production will be steadily increased to at least 10 engines a day by the end of the year, and the aeroplane factory will be easily able to keep pace with the engine production or even to exceed it. To date about 40 engines have been sent to France, the first passing the French Government test, and proving to be interchangeable in every detail with the engines made in French factories. The engine produces 150 h.p. at under 1,500 r.p.m., and in a recent test a machine fitted with one of these engines attained 9,700 ft. in 15 minutes, getting off the ground in 5 seconds, with a passenger as well as the pilot.

* * *

It is reported from Mineola that an escapade in which two mechanics deliberately disobeyed orders by taking into the air one of the instruction machines at Mineola ended disastrously on May 7th, when Pte. Ransome H. Merritt and Pte. Anthony P. Spilener were killed. The two young men, over-ambitious about acquiring a knowledge of aeroplane handling, took advantage of the fact that they had been ordered to prepare one of the L.W.F. biplanes for the day's instruction. Without permission they took the machine into the air, and after a half hour's thrilling gyrations one of the wings collapsed and the machine crashed to earth, killing both of the occupants.

AIRCRAFT IN THE HOUSE.

On June 27th **Major Baird** (Rugby, U.), replying to **Mr. Pemberton-Billing** (Hertford, Ind.), who asked whether any complaint had been received regarding the type of machine supplied to the air pilots on service with the British troops in Mesopotamia, said:—I am not aware of the receipt of any communication on this matter which could with correctness be described as a complaint. The Commander-in-Chief in Mesopotamia has stated that he would like certain additions to the aeronautical equipment of his forces, and his wishes in this respect are being met.

Mr. Pemberton-Billing: Is the hon. gentleman aware that the German Government have discovered our *ruses de guerre*, and are we making this a dumping-ground for our worst "dud" machines?

Colonel C. Lowther (Cumberland, Eskdale, U.): Will an opportunity be given for the discussion of the Mesopotamia scandal?

The Speaker intervened, and no further answer was given.

The Chancellor of the Exchequer, replying to **Colonel Claude Lowther** (Cumberland, Eskdale, U.), who asked whether the refusal to entertain any organised system of reprisals was due to the fact of their impracticability or to the Government's antipathy to methods which they considered barbarous, said: I can only refer my hon. friend to the answer which I gave yesterday.

The Chancellor of the Exchequer, in reply to **Mr. Pemberton-Billing,** again declined to give an early date for a debate on our Air Services, policies and administrations.

Mr. Pemberton-Billing: Is the War Cabinet, the Government, or this House responsible to the people for the conduct of the policy of this country?

The Chancellor of the Exchequer: The War Cabinet is responsible to this House, and between us we are responsible to the people.

Mr. Pemberton-Billing: Will the right hon. gentleman give this House an opportunity of expressing its views or at least the views of the country?

The Chancellor of the Exchequer: I have answered questions of this kind, I think, once a day for 10 days, and I have said more than once that if there is any general desire to discuss the question an opportunity will be given.

Colonel C. Lowther: Are we to understand that the bombing of our cities, the murder of women and children, and other acts contrary to civilised warfare are to go on for ever unpunished?

The Chancellor of the Exchequer: Not if we are able to stop them.

Sir G. Cave (Kingston, Surrey, U.), replying to **Mr. Pemberton-Billing,** said the Field-Marshal Commanding-in-Chief established some time ago a system of night warnings of air raids which covered the whole country and had worked well, and he had now established a system of day warnings in the area exposed to attack by hostile aeroplanes. In both cases the warnings were conveyed to the proper military and police authorities and to certain factories and institutions where special precautionary measures were required in the public interest; no public warning was given by the military authorities. In certain areas public warnings were prohibited by military order, and the Government had now decided that no public warnings should be given in London, but elsewhere local authorities were allowed to give such warning if they thought it desirable.

Mr. Pemberton-Billing, in the course of a supplementary question, answered by **Major Baird,** said the question was put to the Prime Minister; it was one of policy and not for a "political under-strapper" to answer. Subsequently **Mr. Billing** was putting a further question, when **Sir S. Roberts** (Sheffield, Ecclesall, U.), asked whether a Minister was obliged to answer an hon. member who had used offensive expressions towards him.

The Speaker: It is not the way, of course, to get an answer. (Laughter.)

* * *

The House having gone into Committee, **Dr. Addison** delivered a lengthy address upon the work of the Ministry of Munitions, in which the following reference to aircraft production occurred:

When early in this year the Ministry was asked to undertake the supply of aeroplanes and seaplanes for the Army and the Navy, it became evident that the mobilisation of all our resources for the production of internal combustion engines under a unified scheme of direction was essential. The production of all internal combustion engines is now under the direction of Mr. Martin, who left the B.S.A. Company and the Daimler Motor Company to join the Ministry for this purpose. By a continued effort to diminish the number of types and to concentrate on the best, with a policy of securing that one shop shall be devoted to the production of only a single type of engine, we have already obtained an enormous increase in production, apart from the addition either of machinery or labour.

At the same time, I asked Sir William Weir, who had done

JOSEPH EVANS & CO., LTD.,

Liverpool Street, BIRMINGHAM.

TELEGRAMS: "ADEPT, BIRMINGHAM." TELEPHONE Nos.: CENTRAL {1774. 733.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

such good work for us as Director of Munitions for Scotland, to take charge of the supply of aeroplanes and seaplanes. He and Mr. Martin became members of the Air Board and of its Technical Committee, not only as representatives of supply, but so as to establish a close working relation between the manufacturing side and the formulation of programmes and designs which properly belongs to the Air Board.

Under Sir William Weir's direction, the increase in the output of aeroplanes is already rapidly increasing. The production for May is more than twice that of December, and the supply by Christmas will be vastly greater than it is now. This Department makes a particular demand on skilled workers, and our increased production of aeroplanes depends mainly upon an adequate supply of skilled workers.

MILITARY SERVICE. EDITOR OF "THE AEROPLANE."

The following question stood on the Paper in the name of **Mr. Churchill** on July 2nd:—

64. To ask the Under Secretary of State for War whether his attention has been called to the fact that Mr. C. G. Grey, editor, part proprietor, manager, and director of THE AEROPLANE, aged forty-one years and seven months, and previously marked unfit for military service, has now been medically classified as C2 on examination by the Westminster Tribunal; and whether, having regard to the value and importance of THE AEROPLANE newspaper as a means of interchanging knowledge between all branches of our rapidly extending Air Services and affording a supply of valuable, technical and other information to the officers and men and to Mr. Grey's exceptional knowledge of all matters connected with aviation from its earliest beginnings, he will place the editor of this technical and Service paper in the same position as is recognised in the case of the editors of political daily papers?

Mr. Billing: On behalf of my right hon. friend, I beg to ask question No. 64.

Mr. Macpherson: This case is under consideration by the tribunals, and must be left to their decision. In the special circumstances, however, the military representative has been instructed not to press for Mr. Grey to be made available for military service.

Sir W. Collins: Is it in order for an hon. Member to ask a question for another Member without his consent?

Mr. Speaker: I assumed, naturally, that the hon. Member had the consent of the right hon. gentleman. Otherwise I presume that he would not ask the question.

THE AERONAUTICAL SOCIETY OF GREAT BRITAIN.

The following have been elected to the Aeronautical Society:—

Fellows.—F. W. Lanchester, M.Inst.C.E.; Dugald Clerk, D.Sc., F.R.S.; Lt.-Col. Mervyn O'Gorman, C.B.

Associate Fellows.—Lt.-Col. R. K. Bagnall Wild, G. H. Handasyde, T. G. John, A. W. Judge, H. P. Martin, R. Borlase Matthews, R. Richardson, Capt. T. E. Robertson, F. R. Smith, T. O. M. Sopwith, W. G. Carter, F. Sigrist, Capt. W. S. Farren, Lt. Norman Barrett, Capt. F. S. Barnwell, E. G. Walker, R. H. Verney, W. H. Allen, L. W. Bryant, W. H. Barling, Dr. J. E. Ramsbottom, Thos. Jones, C. W. Alexander, J. M. Heesem, Comdr. W. Briggs, H. B. Irving, R. A. Bruce, Capt. H. Grinsted, J. G. Florence, E. Spencer, H. Knowler, Lt. H. E. Wimperis, W. Brierley, G. P. Bulman, F. T. Hill, A. S. A. Ormsby, W. E. Dommett, C. H. Brooks, S. H. Smith, J. D. Scaife, H. T. Tizard, J. B. Blondeau, K. Secretan, E. G. Cole, H. C. Fuller, G. H. Hales, C. H. Powell, J. R. Pannell, R. Chadwick, E. Robinson, O. P. Monckton, G. E. Barnhart, O. W. Thomas, A. A. Remington.

Student Members.—A. J. T. Ireland, W. H. Lyne, H. Yendall, W. E. James, J. Williams, L. S. Flatman, R. K. Heysham, J. N. F. Morris, R. W. Sutton, Joseph Shepherd, V. W. Derrington

Members.—Brig.-Gen. D. Pilcher, N. G. Gwynne, Lord Cowdray, Col. W. B. Caddell, F. M. T. Lange, J. H. Newton, Miss E. M. L. Wade, C. G. Gourlay, W. J. Skevington, Major A. H. Burgoyne, M.P., B. Wortman, H. S. O'Brien, H. T. Vane, R. F. Rowbotham, H. Knox, H. Noel, J. P. H. Bewsher, A. Boake, R. C. Searle, H. G. Wells, E. H. Dyson, Lt. W. R. Dainty.

Associate Members.—D. M. Sullivan, S. Holroyd, Lady Jenkins, R. G. Laws, J. N. P. Morris, J. B. Phillips, R. C. Carver, Mrs. St. John, A. Davidson, W. Thorpe Haddock, W. Chater Lea, D. Mooney, F. J. Poynton, Miss A. Freeland Squire, C. W. Mayne, E. Scott.

THE FIRST PRIZE COURT AEROPLANE CLAIM.

On July 2nd, the Right Hon. Sir Samuel Evans made a grant of prize bounty to the officers and crews of H.M.S. "Severn" and "Mersey" for the destruction of the German cruiser "Königsberg" in July, 1915. Commander Maxwell H. Anderson, R.N., appeared in support of the motion. The occasion was remarkable in that the claimants included the officers and men of the R.N.A.S. operating the two aeroplanes used.

Counsel said that with regard to the pilots and observers of the aeroplanes, they belonged to the R.N.A.S., and were lent to the "Severn" and the "Mersey" for these operations. They were on the books of the monitors, and he submitted that they formed part of the crews of those vessels and were entitled to share in the prize bounty.

The President, in giving judgment, said:—The only new feature in this case is that application is made also on behalf of the officers and men who were serving in the aeroplanes to be included among those who are entitled to have prize bounty granted and distributed. The officers and men of the two aeroplanes belonged to the Royal Naval Air Service, and it is admitted that they were attached to the "Mersey" and the "Severn" for these operations; and it is clear from the report that the services rendered by them were of a very valuable kind. I think that I am acting well within my powers in deciding that the officers and men belonging to the two aeroplanes, for the purpose of section 42 of the Naval Prize Act, 1864, formed part of the crews of the "Severn" and the "Mersey."

I pronounce and declare, therefore, that the officers and ships' companies of the "Severn" and the "Mersey" and the officers and the men of the two aeroplanes were present at and assisted in the destruction of the armed ship "Königsberg," belonging at the time to enemies of His Majesty, and that at the beginning of the engagement there were on board the "Königsberg" 384 persons, and therefore the amount of the prize bounty payable at the rate of £5 per head is £1,920.

CONDOLENCES.

Sec. Lt. John Spencer Dunville, Dragoons, who has died from wounds received in action, was the second son of Mr. John Dunville, of Redburn, Holywood, Co. Dublin, and of Sion, Co. Meath, who is now a squadron commander Royal Naval Air Service, and was for some time political secretary to the late Duke of Devonshire.

The young officer who is now dead was 21 years of age last May. He had held a commission in the Dragoons since Jan. 1st, 1916.

His father and mother are among the pioneers of aeronautics in this country, having been enthusiastic balloonists for a number of years, and having done most valuable work in the foundation of the Aero Club, amongst whose members they are most highly esteemed and respected. To them all concerned with aeronautics will tender the deepest condolences in the loss of their son, and will regret the loss to the King's Service of so promising an officer.

A TELEGRAPHIC ADDRESS.

It should be noted that the telegraphic address of the British Emaillite Co., Ltd., of 30, Regent Street, S.W.1, has now been changed to "Ridleypren," Piccy., London, and customers are requested to make the necessary alterations in their files in order to save delay by incorrect telegraphic address.

AN HONOUR.

One is pleased to record that Mr. W. Lionel Naylor, Director of Naylor Bros., Ltd., who has been on active service in France since the beginning of the war, has been awarded the Meritorious Service Medal for "valuable services rendered with the Armies in the Field."

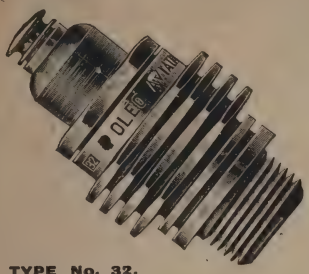
THE SOPWITH SPORTS CLUB.

Under the auspices of the Sopwith Cricket and Lawn Tennis Clubs an al fresco concert and dance took place on the "O.K's." sports ground on Saturday evening, June 23rd. Unfortunately the temperature was most uncongenial for an open-air function, but in spite of the cold wind a good number patronised the concert, the majority occupying seats in the shelter of the stand. Mr. Alfred Smith, who arranged the programme, secured the services of his Penrhyn String Orchestra.

At a late hour in the evening dancing commenced, and many devotees enjoyed a full programme, for which the Penrhyn orchestra again provided the music. Mr. V. W. Derrington, hon. Secretary of the tennis club, carried out the arrangements, and Mr. R. E. Edwards proved a capable M.C.

AN ACCIDENT.

Many readers will regret to learn that Mr. H. Sykes, the well-known Whitehead Aircraft pilot-tester, met with a mishap on June 25th while flying at the Hanworth Park Aerodrome.

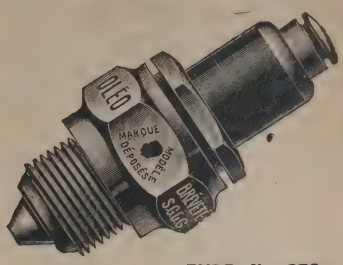


He was testing a new Scout machine when the engine failed The latest news to hand reports that he is making satisfactory progress, and all will wish him a speedy recovery.

A BARGAIN SALE.

The lady readers of THE AEROPLANE will do well to note that a special summer sale is being held by Robinson and Cleaver, Ltd., at the Linen Hall, 156-168, Regent Street, W.1., which will continue throughout July.

The absence of an "Aunt Jemima" on the staff of THE AEROPLANE makes the publication of technical details of the various goods impossible. Those interested should apply to the firm for a catalogue.



Incidentally, one gathers that there are a number of bargains of interest to officers in the Royal Naval Air Service and the Royal Flying Corps.

THE TRAINING OF AERONAUTICAL ENGINEERS.

By R. MULLINEUX WALMSLEY, D.Sc., F.R.S.E., and C. E. LARARD, M.I.C.E., M.I.M.E.

On Wednesday, June 27th, a paper was read to the Aeronautical Society by Dr. R. Mullineux Walmsley, the Principal of the Northampton Institute. The following pages include the paper as read, plus sundry portions omitted in the reading.

Mr. A. E. Berriman took the chair in the unavoidable absence of Sir Edward Busk. He said that education is itself a subject requiring as careful and laborious study as any other topic which had been discussed by the Aeronautical Society. The true significance of this fact was not sufficiently appreciated. We should understand the importance of trying to lay the foundations of technical education truly and well. He paid an eloquent tribute to the work done by the Northampton Institute.

Dr. Walmsley said:—

In winding up with the paper of this evening a highly successful session of the Aeronautical Society of Great Britain, the authors desire to express their appreciation of the honour of being invited to conclude the series of lectures and papers delivered during the last six months. They hope they will not be misunderstood when they venture to affirm that, both in the planning of the course to cover practically every section and in the high level of excellence of the individual papers, the present necessities and the future of the science and practice of aeronautics have been admirably served. And to-night we reach as a fitting climax, because of its direct bearing on development in the immediate and still more in the distant future, the all-important subject of the education of our aeronautical engineers, that is, the education of those who are to follow in the footsteps of the readers of the preceding papers and their coadjutors and of those on whose fitness in the widest sense of the word the future of aeronautics in this country will depend.

In many quarters it is invariably the custom to overlook the fact that education is the most technical of all subjects, and requires as careful and laborious a study as any of those subjects which have preceded it in its course. That this is not generally recognised would be borne in upon anyone who would have the patience to read the proceedings and discussions of the numerous educational conferences, and I know one who has done it, which have been such a marked feature of the past winter. Education is "in the air," and has given rise to an almost endless succession of papers and speeches with little variation in the subject matter; the same things have been repeated *ad nauseam*, sometimes with very little difference in phraseology, while the number of really new ideas produced has been remarkably few. It is hoped, however, that as the authors are dealing with education for a new profession, which itself is in a state of flux, they may, in what follows, contribute something of value to the general discussion. The following is, at any rate, a genuine attempt to place aeronautics on its educational side on a sound basis, so that, on this side, it may rank with the older well-established branches of engineering.

It is assumed that it is unnecessary to discuss the question as to the necessity for well-thought-out and co-ordinated schemes for the technical education of those who are to take charge in the near future of this important and scientific industry, that is, if this country is "to take the air and keep it," as has been recently well said by a well-known authority. If anything could have emphasised the point it would have been the far-reaching plans unfolded in the interesting paper of Mr. Holt Thomas and the discussion thereon barely a month ago in this series of lectures. Those plans take it for granted that a highly-trained staff of constructors and workmen will be available possessing a flexibility of mind based upon sound and varied knowledge which can only be acquired by such training as that which is dealt with in the present paper. The backbone of such a staff is an ample supply of aeronautical engineers who usually commence their professional work as technical assistants and who by habit and training are acquainted with the latest developments of the practical, scientific, and industrial problems which they are called upon to face. The greater part of the paper is, therefore, devoted to a discussion of the methods, as they appear to the authors, of training those who are in a position to devote not less than four years to a training designed to fit them at the end of the training to commence practice as junior or senior technical assistants with every prospect of rising rapidly to higher, responsible positions. The needs of other classes less favourably placed and of those who are to fill lower positions are not lost sight of, and especially of that class of men already in the industry who *must* be given opportunities for keeping abreast of aeronautical developments as they proceed and of making up from time to time the ground which the strenuous nature and preoccupation of their daily work must cause them to lose.

The main object of the paper is the professional training of aeronautical engineers, but before this can be adequately dealt with it is necessary to consider the educational foundation upon which, in the opinion of the authors, this training should be based, for one outcome of the past winter's discussions had been to bring into prominence the chaotic nature of much of the general education of the youth of this country.

PRELIMINARY EDUCATION.

The preliminary education of students who desire to be trained as aeronautical engineers should, in the opinion of the authors, be a good secondary school education, in which the student has been taught, through the medium of the proper subjects of such an education, to think and to weigh evidence. If this end be attained, it is far more important than any workshop or other quasi-technical training that can be obtained in a secondary school, especially if, as is often the case, such training is given at the cost of the more essential subjects of a secondary school education. The claims of science and scientific method to be included in such a curriculum have now been practically conceded, even by many who have been for long years staunch upholders of the claims of the "humanities," to dominate the time-table to the exclusion of nearly everything else but mathematics. A good grounding in mathematics is, of course, of prime importance to the future engineer, and his curriculum must also include a good working knowledge of not less than one modern language, in view of the large amount of scientific and technical literature published in foreign journals and by foreign societies, as well as of the fact that during the next 50 years an enormous amount of engineering work will be required in countries in which English is not the vernacular, and that engineering industrial developments will be the common heritage for all time of all the civilised countries of the world.

For many years science was practically tabooed in the secondary schools on the plea that there was no room for it in a time-table in which even modern languages had not a very conspicuous share. What was still worse was that the best and brightest boys, or, at any rate, those developing the greatest promise, were never given a chance of showing their aptitude for a scientific training, but at an early period of their school career were set to specialised studies in the humanities, including an excessive amount of time devoted to Latin and Greek, so that in due course a small minority of them might bring renown and distinction to the school by winning University scholarships. Meanwhile, as a sop to public opinion, a "modern" side was formed, to which only the conspicuous failures were drafted.

These evil methods still persist in certain schools, but other dangers have more recently begun to show themselves in quite another direction. There is now a danger that science may not be adequately dealt with because of the desire to include "engineering" subjects in the time-table. The prospective engineer should first be well educated, in the proper sense of the word, in mathematics, in the humanities (but including English and modern languages), and in science, his education in science being with a view to training in scientific method rather than to the handling of a large number of subjects. An education which adequately covers this range will certainly fill the limited time of the average boy and will satisfy the ambition of the most voracious schoolboy. The intensive study of the sciences on which all engineering is based as well as the special "engineering" subjects which, of late years, are becoming fashionable in certain schools will be far more advantageously and economically postponed until the time when real professional training is undertaken.

If the student has received a good education, in the sense set forth, he should be ready to start his engineering training by the time he reaches the age of 17 in the case of the best students, and at 18 in the case of students whose development is not so well forward. From the engineering point of view, the retention of a youth at a secondary school beyond these ages for the purpose of taking so-called "engineering subjects" constitutes a very serious loss of time, in view of the fact that such subjects cannot be properly and economically taught, except in correlation with a systematic and well-organised complete engineering course, and further, such work cannot in general be effective when undertaken by any but a fully qualified engineering teacher. It is obvious that when subsequently attending a complete engineering course at a technical college the student will receive in fuller and sounder measure such instruction as part of the regular course covering all, and more than all, he could have possibly received in a secondary school; and moreover, there is a real danger, which has been actually experienced, that certain methods and ideas included in certain school courses may have to be corrected, if not eradicated.

TECHNICAL TRAINING.

Passing now from the preliminary but important school work to the subsequent professional training, there is much division of

AERONAUTICAL ENGINEERS

Designers, Manufacturers and Contractors,

126-132 NEW KINGS ROAD, FULHAM, LONDON, S.W.6.

opinion among engineers and engineering teachers as to the position which workshop training should occupy in relation to the more purely technical training of the student. Many engineers and engineering teachers are of opinion that practical experience on the works or in the factory of an engineer should be gained *before* taking up an engineering course at a technical college. They argue

(1) That works experience is necessary to enable the student to take full advantage and realise the importance of his studies at an engineering college.

(2) That it does not follow that a man who has first passed through the technical college will necessarily make a successful engineer, the works training under practical conditions being, it is asserted, the best test for his fitness.

(3) That the student trained in the technical college does not, after his college course, take kindly to the manual labour in the shops necessary to complete his experience, and that when he passes into the works as a workman he finds a greater difficulty in raising himself afterwards to a position of responsibility than one who has obtained works experience first and technical training afterwards.

There are, however, other well-known engineers (and engineering teachers) who are of opinion that the above views are too often based on an imperfect knowledge of what a really good technical course in a modern and up-to-date technical college can accomplish, especially if it be combined with practical experience in works judiciously introduced at the proper period when the early stages of engineering training have been sufficiently developed to prepare the student to assimilate the experience of a commercial workshop more rapidly. Such systems of engineering education are now known as "Sandwich" systems, and as long ago as 1903 a pioneer system of this type was adopted at the Northampton Polytechnic Institute, after a careful and exhaustive inquiry into the details and the results of the various systems of engineering education then in being in the chief countries turning out good engineering work. In organising, planning, and carrying out the necessary instruction courses, the Principal, who introduced the system, has received the loyal co-operation of his colleagues on the staff; and it is to this co-operation that the success attained is due, and what immediately follows is based upon the experience so gained in 14 years, and not upon mere educational theory.

It is therefore submitted that engineering training in a well-staffed and well-equipped technical college should be started directly the student leaves the secondary school, and that for this purpose, as college sessions begin at the end of September, he should leave school not at Christmas or Easter, but only at the end of the summer term in July. As already mentioned, it is considered in some quarters desirable that a student, on leaving the secondary school, should go straight into a works for, say, a year, in order that it may be ascertained whether he has any aptitude for engineering training. There is, however, a good deal of evidence to support the opinion that aptitude for engineering training can be more readily and quickly tested in a well-organised technical college, staffed with men who have been through the works—that is essential—than it can in the works. The question is, to some extent, one of "lost time." In the works weeks, if not months, must inevitably be lost before the student begins to understand in any educational sense what is going on around him. On the other hand, if he goes straight to the technical college his education is continued without a break being very apparent. In fact, one of the difficulties in a modern technical college—one meets with it continually—is to make the first-year student realise that he is no longer at school, and that his professional work has commenced, and further that the greater freedom of college conditions, which he is quick to take advantage of, is accompanied by a correspondingly greater amount of individual responsibility.

For admission to the college the student should be required to pass an entrance examination if he has not, as he should have done, passed an examination qualifying for admission to a University before leaving the secondary school. But such an entrance examination and even the University matriculation should be regarded as merely indicative, and not as the actual test of the candidate's aptitude for an engineering career. The real entrance examination in a technical college is the work of the first term, or of the first session, and during one or other of these periods the trained staff is capable of answering very definitely the question, "Should the engineering training be continued?" If the answer be in the negative, the training should be dropped not later than the end of the first year, and the student should devote his energies to some other training more in accordance with his natural bent. If, however, it is decided that failure in the first year is due merely to a student, as is sometimes the case, failing to realise responsibilities and opportunities, he should be given another opportunity of facing the first year's work.

As to the kind of training specially suitable for aeronautical engineers, the authors make no apology for basing the schemes which they put forward upon the experience of the teaching of aeronautics gained at the Northampton Polytechnic Institute, at which pioneer courses were started in September, 1909. This experience is combined with their experience in the successful training of engineers in other branches of engineering which has been referred to above. Detailed syllabuses and time-tables are set forth in Appendices I and II, and in the following remarks reference is made to these.

APPENDIX I.—SPECIAL SYLLABUSES.

I.—General Aeronautics.

(Principles and Machines.)

The Atmosphere—properties. Air at rest and in motion. Meteorology.

Definitions and first principles.

Action of air currents on plane and curved surfaces. Mass, centre of gravity, centre of pressure, lift, thrust, etc. Inertia.

Resistance to motion—wing, body, and fuselage parts. Stream line flow.

The methods used by various experimenters to determine quantitatively the air pressures on planes and bodies. Experimental data. Illustration by smoke photographs.

Angle of incidence, aspect ratio, plan form. Flight-gliding—horizontal and oblique, flight paths. Loading, speed and power. Range of power. Climbing. Equilibrium and stability—longitudinal, lateral and directional. Automatic stability. Stability devices. The tail or elevator. Dihedral angle. Steering. Propulsion, position of screws and direction of thrust. Stability and speed.

Distribution of pressure on wing elements. Movements of the C.P. on wing sections.

Laws of similitude.

Turning, elevating or depressing, banking, rolling, pitching, skidding, looping, etc.

Oscillations. Gyroscopic action. Effects of fluctuation of stresses on the structural parts. Fatigue of materials and of structural members.

Design.—The mechanical design and construction of aeroplanes. Wing surfaces and camber—forms and arrangement. Monoplanes, biplanes, and multiplanes; wing warping; the fuselage, body, stays, struts, and attachments: the undercarriage and shock absorbers. Starting and alighting devices. Boxing in and form of envelope. Skin friction. Bearings and joints. Transmission mechanisms. Controls. Instruments.

Materials of construction:—Steel, special alloys, wood, paints, varnishes, etc.

Assembling. Storage accommodation, heating, lighting, signals, etc. Cost.

Dirigibles. Seaplanes and lighter-than-air machines.

Accidents and their cause, analysis.

Applications.—Radii of action. Warfare, sport. Passenger, mail, etc. Speed and distance. Cost per ton mile. Modifications in design.

II.—Aero-Engines.

Cycles for internal combustion engines—Otto and two-stroke cycles. Advantages and disadvantages. Ideal and practical thermal efficiencies. Special considerations in designing aero-engines of reasonable weight. General theoretical and practical calculations. Weight and power of engines in relation to aeroplane speed range.

Petrol, its combustion and behaviour in the cylinder. Petrol storage in machines.

Arrangement of cylinder and crankshaft torque. Balancing. Vibration, periodic and variable, and dangerous stresses.

Water-cooling systems. Air cooling.

Lubricating systems. Lubricating oils and testing.

Types of aero-engine—horizontal, vertical, diagonal, or V. Radial, rotary and special considerations in design. The aero-engine of the future.

The design of special mechanisms and parts, such as cams, valves, port and pipe ways. Carburettors and carburation.

The fixing of the engine.

Ignition and electrical devices. Sequence or order of firing. Wiring and connections.

Accessibility of parts for rapid de-mantling and reassembling. Reliability and durability in running.

III.—Aerial Propellers.

(Their Theory and Design.)

Geometry of the screw and of propeller. Definitions. Air flow and forces on blade elements. Principles and formulæ. Blade shapes and sections. Various graphs for load, stresses, thrust, efficiency, horse-power, etc. Stresses due to centrifugal action and due to bending. The air screw at different speeds of translation. The propeller considered as an helicopter. Lifting effort. Effect of propeller on stability of machine with calculation on couples due to gyroscopic action. Design of propellers.

Materials used in construction. "Laying out" of an air screw. Results of researches on the behavious of air screws in the laboratory and under practical conditions of flight.

A view of the Barimar Shops.

BARIMAR

Scientific Welding Service

is the Largest Organisation of Qualified Welding Engineers in the United Kingdom.

BARIMAR factories and machine shops now cover a floor space of over 27,350 square feet.

BARIMAR is everywhere acknowledged to be at the head of the industry, and more than 25,000 customers can testify to the great saving of time and money made possible by BARIMAR Guaranteed Repairs. To National Interests in agriculture, in factory, in munition works, BARIMAR is invaluable. And the scope of this great organisation extends to H.M. Admiralty and War Office, Royal Ordnance and Royal Aircraft Factories, Shipbuilders, and great Engineering houses throughout the country.

To you in your difficulties with smashed engine parts, cracked cylinders, broken crankcases, damaged boilers, broken gearing, smashed castings, etc., BARIMAR holds out the same helping hand that has the confidence of thousands—the same moderate prices—the same protective Guarantee.

Barimar Headquarters at Poland Street.

How to send Goods:

Remove all fittings. Label plainly with your name and address. Despatch goods carriage paid and post written instructions same day.

BARIMAR, LTD.

(Dept. BC),

10, POLAND STREET, LONDON, W.1.

Telephone—8173 Gerrard.
Telegrams—"Bariquamar, Reg., London."

Barimar Guarantee

is an undertaking to effect a perfect repair or refund the money in the event of failure. Any goods sent for repair under these Guarantee conditions should be marked accordingly.

APPENDIX II.

TIME-TABLES.

PART I.*—AERONAUTICAL ENGINEERING.

*HOURS.	MONDAY	TUESDAY.	WEDNESDAY.	THURSDAY.	FRIDAY.
10.0	Mathematics. Mechanics.*	Mathematics Exercises.	Mathematics Exs.	Mathematics.	Engineering Drawing and Design.
11.0	Mechanics. Exercises.	Physics (Optics)	Physics (Heat).	Physics (Electricity and Magnetism).	
12.0	Mechanics.	Engineering Design Lecture (A).	Physics Exercises.	Mathematics and Physics Exercises.	
2.0	Freehand Drawing	Physics Laboratory.	Chemistry Lecture.	Engineering Workshop.	Physics Laboratory
3.0	Mechanics Laboratory		Chemistry Laboratory.		
4.0					Gymnasium.

** Each part covers a session's work.*

PART II.—AERONAUTICAL ENGINEERING

HOURS.	MONDAY	TUESDAY	WEDNESDAY.	THURSDAY.	FRIDAY.	SATURDAY.

3.0	Engineering Exercises			Aeronautical Lectures (Machines and Design).		
4.0 to 5.0	Gymnastics			Gymnastics.		

No distinction is made in what follows between the professional training of engineers in the Universities and in technical institutes. In both cases the training is essentially the same for all students who are commencing their training and for all students up to the standard of a first, including an honours, degree at the University. As a matter of fact, throughout the country the association of the larger technical institutes with the Universities is very close indeed. In London the principal teachers of engineering, in the more important of the polytechnics which deal prominently with engineering, are members of the Boards of Studies in Engineering at the University, and these institutions are recognised under the University Statutes for training internal students. In Manchester the association is even closer, the Municipal School of Technology being a part of the University for all effective purposes. Similar associations exist elsewhere, but in accordance with our time-honoured English plan of doing these things, they differ in detail in almost every instance.

The chief function of a technical college in this connection is obviously to train real engineers and not merely to train University graduates, but if the University curriculum is properly drafted, the two curricula cannot differ very much up to the honours standard of a first degree. Where the University work in the future should be most differentiated from that of the technical colleges should be in the greater leisure and opportunities for post-graduate research, though, as is well known, such research is by no means neglected at the foremost technical colleges, and the point is dealt with later.

For the purposes of this paper it will be convenient in taking up the details to separate that part of the college training which is not specially aeronautical, but is common to other branches of engineering, from the part which is more particularly required by aeronautical engineers, and which would not, as a rule, be taken by other engineering students.

THE NECESSARY COLLEGE TRAINING NOT SPECIALLY AERONAUTICAL.

It is not clearly understood by some aeronautical engineers and by many others that a sound preliminary training in general engineering principles similar to that outlined in the Northampton Institute syllabuses for first and second-year day students is required before any reasonable progress can be made with the higher studies in aeronautics, or even of any studies in aeronautics distinctively so called; and further, that concurrently with the specialised instruction in aeronautical engineering following such a preliminary training, much higher instruction work in mechanical engineering is required. For instance, it is essential that the student's mathematical studies shall continue through each year while attending the technical college, the standard of knowledge attained being the same as for other departments of engineering, and including a good working knowledge of the differential and integral calculus and of higher mathematics generally.

The course outlined is intended to cover four ordinary educational sessions from the beginning of October in the first year to July in the fourth year. In this period the second and third summers, from April to October, are to be spent in commercial workshops, with only such works holidays as fall within those months.

The first session's work is based upon the assumption that the prospective student has attained the well-known standard set for the matriculation at the University of London, either in a general examination or through the senior school examination. This ensures a fair knowledge of elementary mathematics, the power of expression in English, a knowledge of one language, and

some knowledge of a science from which it is hoped that the student has acquired some idea of scientific methods. So as not to exclude latent engineering talent, however, some students are admitted on a designedly lower entrance standard in view of the rigorous application of the plan set forth above of treating the whole of the first year's work as an extended entrance examination.

The first session's work is devoted to a thorough grounding in mathematics, pure and applied, physics and chemistry, with the addition of engineering drawing and elementary engineering design, such as is required by all engineers, civil or mechanical. It is during this period that the ineligibles and the slackers are weeded out, rather than at the entrance examination, at which some of the students on the border line for passing can, therefore, be admitted as probationers, to give them a chance of showing whether they are likely to be successful in the later courses.

Special technological training begins with the second session which, as already explained, is a two-term session, at the end of which works' experience, lasting from Easter to October, is to be started. Distinct specialisation begins from the time the student goes into the works at Easter of this second session, and from that time onward the aim is to train him very specially in some main branch of engineering, in this case in aeronautics, whilst giving him a good knowledge in other branches. It must be understood that in these later years, notwithstanding early promise, a particular student may show that he is unable to assimilate the highest training offered. In such a case it will be advantageous to transfer the student to the works when he has reached the limit of the college training which he is capable of absorbing, and which will undoubtedly be a great advantage to him in his subsequent work.

Time-tables for these two sessions of general training are given in Appendix II, but as detailed syllabuses are not given in Appendix I, a few remarks may be made upon the scope of the work in the various subjects at this stage.

In mathematics the aim throughout is to train and develop the student's mathematical faculty (which if poor or entirely lacking will disqualify him from dealing with advanced problems in engineering) in such a way that ordinary mathematical processes in algebra, geometry, trigonometry, and the differential and integral calculus become *working tools*, to be almost unconsciously used as a matter of habit.

The physics in the preliminary course is treated with the distinct purpose of qualifying the student specialising in aeronautics later on to deal readily *inter alia* with the theory and practical calculations of aero-engine cycles, to grip the principles and details of magneto ignition and other electrical devices carried by aircraft, and to understand their observational equipment, etc., etc.

The special study of aero-engines must obviously be preceded by an outline study of heat engines generally and of heat engine cycles, particularly those dealing with internal combustion engines. The fundamental principles of hydraulics and pneumatics, as well as of meteorology, call for special study during the preliminary work at a properly organised course of instruction in aeronautics.

During this preliminary course the student also acquires a knowledge of the principles of chemistry sufficient, at least, to enable him to deal effectively, when taking the higher and more specialised work of the advanced course, with the necessary calculations on the combustion of fuel, and particularly of gaseous fuels. His laboratory training includes the use of gas analysis apparatus and the analyses of exhaust gases from internal combustion engines.

His preliminary studies of engineering materials, from the chemical as well as the mechanical point of view, are designed to enable him to understand the importance of a chemical analysis of the material and of the influence, beneficial or deleterious, of small percentages of certain chemical elements on the properties of the material for resisting static or kinetic stress and on the elasticity and resilience of the material.

Aeronautical drawing and design obviously cannot be properly dealt with until the student has first mastered the elements of geometrical and mechanical drawing and made himself familiar with drawing office methods. This preliminary training, therefore, is dealt with before attempting any specialisation in aeronautics. In the courses and time-tables given in Appendix II provision is made during the first session for giving a thorough grounding in these essentials, and it is unnecessary in a paper of this kind to give a syllabus of the kind of preliminary work in this connection. It is too well known to require specification.

And last, but not by any menas of least importance, some attention must be given to the business or commercial side of engineering. How often has it been said by the employer, "Yes, So-and-so is excellently trained in engineering theory and is even fairly good as a designer, but in business matters he is a baby, and not to be compared with men in my works who, though they may not be good at theory, know and can deal with the bearing of their work in relation to £ s. d. It is a pity that the technical schools cannot give some attention to their work in its business aspect." Even in the preliminary work, therefore, this aspect must not be overlooked, though its formal treatment belongs more properly to the specialised work of the third and fourth sessions.

The College Training specially Aeronautical.

This special training, as already explained, is dealt with in the third and fourth sessions' work for which the time-tables will be found in Appendix II. For the special subjects appearing in these time-tables detailed syllabuses will be found in Appendix I, but in view of the relevancy of these subjects a few general remarks will not be inappropriate here.

The theory of machines and of mechanism, to lead up to which a good knowledge of mechanics is provided in the first two years, form a special feature of the advanced work in direct relationship to many practical problems, such, for example, as the inertia effects of moving masses, whether free or constrained, as in the primary and secondary balancing of engine parts. In this connection the gyroscopic effects on the machine, due to rotation or turning, in the engines, mechanism or propeller, and also the machine itself, are fully dealt with.

The advanced design work for aircraft prime movers necessarily involves the advanced theory of heat engines, modified by practical considerations and experience, together with mechanical design based on a full knowledge of the strength, elasticity, fatigue and durability of materials.

More advanced work than can well be included in preliminary courses is, therefore, given on the strength, elasticity and fatigue of materials, and proceeds concurrently with specialised instruction work in other subjects of aeronautical engineering. The effects of fatigue on the various parts of an aeroplane structure due to repetitions and variations of stresses does not yet appear to have attracted serious attention in connection with aeroplane work, and, no doubt, some disastrous failures of machines are due to such effects.

The advanced drawing office work in aeronautics consists in applying the general principles and experimental data for aircraft to the design of the details, the chief parts of the machine, and finally the full structure, with provision for more advanced design for students who wish to specialise in some particular section of the work, e.g., engines, or propellers, or fuselage.

Very little has as yet been properly standardised for the constructive details, or even for the full machine, and each manufacturing firm is to some extent a law unto itself. This is, of course, inevitable from the nature of the case. Only a very limited amount of standardisation would at the present time be of any value, for the design work for aeroplanes is in such a state of flux that parts have to be designed and re-designed over and over again before anything final for a particular machine can be arrived at. After each design it becomes necessary in many cases to subject the built-up product to experiment or test in the laboratory and workshop, with the result that more often than not re-design is necessary. For example, unexpected weaknesses may be revealed under test in some part of a joint or clip, so serious as to render the greater part of the design useless until the defect is remedied by a modification of the whole design.

This being the present state of things in relation to aeronautical design it follows that at the technical college testing in many cases should follow preliminary designs so as to arrive at a design distinctly good for the purpose it is intended to serve.

Too much must not be expected from the trained product of a technical college in this respect. As remarked more than once the profession of aeronautics is a new one, and at present subject to ever varying change. A vast amount of experimental work has yet to be done, new ideas which are at present only dimly emerging have yet to be tried, and new materials and combinations of materials have yet to be put to the test of actual utilisation. The manufacturer must be satisfied if the technical college gives him a trained intelligence under the guidance of a sound common sense; in short, a man who is well versed in the fundamental principles of aeronautics, and who can apply his knowledge to a reasonable extent in both experiment and design.

Laboratory work, especially of such a highly technical type as is necessary in the education of aeronautical engineers, does not lend itself in the same way as lecture work to the precise synoptical specification of a formal syllabus, and, therefore, no laboratory syllabus is set out in Appendix I. The scope and range of the work recommended will be better gathered from the following remarks.

In attempting, however, to give even an outline of some of the essential experimental or laboratory work one is brought face to face with the kind of difficulty necessarily experienced in dealing with a new industry or applied science, and in endeavouring to organise the educational work relating thereto so as to give both the systematic instruction in the fundamental principles underlying that industry and to stimulate ideas for future developments.

Seldom in any branch of engineering has a new profession been created in so short a time and never under such dramatic circumstances. Aeronautical engineering as a profession has been brought into prominence and practically created by the great issues at stake in the disastrous conflict still raging. Before the war aeronautics was little more than a sport or pastime; it has now

SANKEY

Fireproof Steel Storage Bins

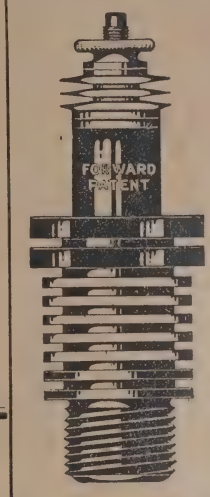
For Workshop and Warehouse

Write for details:

Joseph Sankey & Sons, Ltd.,
Hadley Castle Works,
WELLINGTON, Shropshire.

The FORWARD

Typs. S. Long Barrel



This is the ideal plug for engines with stationary cylinders.

Its patented copper fins ensure that it will cool more rapidly than any other, the conductivity of copper being over 60 per cent. greater than that of steel.

The use of this metal also allows of the fins being made thinner and lighter—another decided advantage.

Behind it, too, is the Forward reputation which in itself is a guarantee of unequalled merit and efficiency.

May we send you special folder dealing with this and other models?

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

definitely taken its place and will in future rank as a great profession.

The laboratory work specially aeronautical in character should consist of the testing of :—

(a) Special materials used in aeronautical construction for strength, elasticity, hardness, and fatigue.

(b) Fastenings, attachments, shock absorbers, and combinations of parts.

(c) Models of different forms in a current of air at different velocities.

(d) Propeller models in translational as well as for rotary motion.

(e) Aero engines.

Much of the laboratory instruction undertaken at the technical college will thus necessarily be of the nature of research, although a good grounding will have to be given in the more usual work dealing with the testing of the strength and properties of material and with the testing of engines generally.

In the testing of materials now commonly used in aeroplane construction, new materials will from time to time have to be tried. In addition to the testing of cables, strainers, and struts and ties, experiments will have to be made on simple and complicated steel and other plate and bolt attachments for building up the light skeleton aeroplane fuselage of wood and metal. The materials testing laboratory for aeronautical engineering students will thus become, at any rate for some years, primarily a research laboratory.

Taking timber, for example, as used in aeroplane building, it might be thought that sufficient experimental data had been accumulated regarding spruce and other woods. But this is not the case, though probably there is much more data available than has been published. Much of the requisition experimental work remains yet to be done in the determination, *inter alia*, of the effect, on the strength and elasticity of the material, of defects inherent in the natural growth of the timber.

It has been shown, for instance, that the useful strength of timber is due to that part of its morphological structure known as "mechanical tissue," and experiments have been made which seem to point to the conclusion that this tissue is actually stronger than steel, but of course it is diffused or spread out by other vegetable or cell structures of negligible strength. Here alone is a vast field for research. Can this mechanical tissue be concentrated into close bundles giving relatively enormous strength, and, if so, will the density of the material be then so high as to prohibit its use? Obviously the density, or mass per unit-volume, is a factor which cannot be neglected in aeroplane work. Some woods are too heavy to be used at present. One of the author's assistants in a research carried out in the Materials Laboratory at the Northampton Polytechnic Institute, showed, for example, that the compressive strength of different kinds of timber was a linear function of the density—a very important result. Other properties, such as tenacity, deflection, and, in the case of struts, buckling, may also be a function of or dependent on the density. Then investigations are required on the strength and elasticity of timber, for the effects of knots and gum veins, the straightness or otherwise of the grain, the closeness of the mechanical tissues, the direction of the grain with respect to the plane of flexure. The effects of water absorbed during variable conditions of climate, e.g., snow, rain, or clouds, and the hygrometric state of the air on the material of the timber, have yet to be investigated.

There is further the necessity of testing plate and other attachments, by means of which the timber parts are secured together to form the skeleton structure of the fuselage, and in this connection those who have had to deal with the design and testing of these plate attachments for wood members know how very difficult it is to secure so firm a holding on such a light wood as spruce as to stand a reasonable working stress. Here again is a valuable field for laboratory work.

Turning to another matter, a very prominent part of the laboratory equipment must consist of a wind tunnel, with its motor-driven propeller and provided with indicating and recording instruments for experiments and research on models of planes and wing surfaces or structures, on models or parts of aeroplane structures, etc. Part of the wind tunnel should be arranged so that the air or streamline flowing past a plane model or solid obstacle can be made visible and the resistance measured. That is, the experimental work should be qualitative as well as quantitative in the determination of lift and drift for surfaces of varying forms and aspect ratios and the resistance of models of aeroplane parts which are required to cut through the air. Indications of best sections and forms can in this way be obtained and provisional designs satisfactorily adjusted.

Workshop and Practical Work.—In the general scheme the bulk of the workshop and practical work is to be taken in actual and not in the college workshops during the two summer periods, referred to hereinbefore, and if in particular cases additional work of this kind is deemed to be necessary it would naturally fall to be taken at the end of the fourth session.

In aeronautical engineering there is one kind of practical work, namely, aviation or flying, which cannot under present conditions be included in the course at a technical college, but in regard to which the student should acquire some definite knowledge. While, therefore, the educational course cannot deal with flying *qua* flying, yet it will be of advantage to arrange for periodical visits of the students to the flying grounds, and even to provide for some lectures given by an engineer-aviator on the behaviour of aeroplanes under practical conditions of flight. In addition, as in other branches of engineering education, visits should be paid to works in which aeroplanes are in various stages of construction. In this way the student will be stimulated in his studies and will gain some insight into the everyday work of the aeronautical engineer.

It may even be found to be possible in the case of the senior students to arrange for trial flights so as to familiarise them still further with the behaviour of the machines upon the theory and designing of which so much of their time will have been spent.

The case is analogous to that of the student apprentices of locomotive engineering or of marine engineering, who are always ambitious to take part in a trial run or a trial trip. Similarly, it is natural to suppose that a trial flight (not as pilot) will have attractions as well as being practically valuable for the student apprentice who is approaching the end of his college training in aeronautics.

Perhaps even the day is not far distant when the requirements of education and research will justify an experimental aerodrome, laboratory and flying ground for experiments on a larger scale and of much wider applications than is possible at the present time. The chief obstacle at the present time is the necessarily heavy expenditure, but to go forward we must not be afraid of this.

Special and Evening Instruction.

No scheme for the education of aeronautical engineers can be considered complete at the present time which fails to take into account the general as well as the specialised instruction required by the very large number of engineers and engineering students who, for various reasons, are quite unable to attend aeronautical courses in an engineering day college.

These men may for the most part be placed in one or other of the following classes or categories :—

(1.) The rank and file of apprentices, learners, improvers and journeymen, the best of whom may subsequently rise to class 2 and who are employed or employable in the shops and drawing offices.

(2.) Trained engineers, military, civil, mechanical, or electrical, who have already received in varying degrees of proficiency the educational training qualifying them for the particular branch of engineering in which they are or have been employed and who, from the force of circumstances, have changed over or intend changing over to aeronautical engineering. From the necessities of the case it goes without saying that, up to the present, the best design and constructive work in aeronautics has been done by men who received their technical education in one or other of the older branches of engineering before aeronautical work developed and this training has proved invaluable to them as a solid foundation for the specialised work of aeronautics. For some time to come the ranks of the aeronautical engineer will still be recruited from men already possessing these solid qualifications, the more ambitious of whom will be eager to supplement their training and experience by special study of the new science.

For the first-named or apprentice category an excellent start, well calculated to arouse the interest and stimulate the ambition of many who are not only too much inclined to waste their leisure time, has been made in the series of works lectures which have been inaugurated by the Society during the present session and which it is proposed to extend in the coming autumn and winter. Further reference is made to this work later.

It is not likely, however, to be overlooked that, if substantial educational benefit is to follow from these lectures, regular and systematic courses must be attended in a well-organised technical college. Such students will have to face much preliminary work in mathematics and general engineering theory, in drawing-office and laboratory work, before any real progress can be made by attendance at classes dealing specially with aeronautical engineering. Indeed, it will be found in this connection, as with other branches of engineering, that a very large number, probably the majority, will never effectively get beyond the mere elements of workshop calculations and drawing. Many are called, but few chosen. Aeronautical engineering, like other professions, requires its "hewers of wood and drawers of water." But we want to give all the men a chance.

Notwithstanding, it is advisable to arrange lecture courses and practical work of an elementary character in aeronautics specially

VARNISH
in 1821

IN 1821 we commenced manufacturing Varnishes, Paints, etc., and at the back of our products stands 96 years' accumulated experience.

Right from the time we first started manufacturing, improved methods, etc., have been promptly adopted, and this policy has resulted in continued progress.

The year 1917 finds us in the front rank of firms manufacturing Woodfillers, Dope Resisting Paints, Varnishes, Enamels, Paints (including Battleship Grey), etc., for Aeroplanes and Seaplanes. We already number many of the leading aircraft manufacturers among our clients, and should much appreciate an opportunity of quoting other firms engaged in the industry.

suitable to the requirements of the man who will join the artisan section of this important industry. He will be a far better workman because of a knowledge of workshop arithmetic and drawing, supplemented by simple laboratory experiments and by information gained whilst attending aeronautical lectures sufficient to arouse and maintain a living interest in his daily work. Some there will be who will rise through and overcome every difficulty and disability, and to these such a preliminary course of work will not only present no insurmountable obstacle, but by the facilities available will help them on their road to higher things. Such men will finally show that they are capable of successfully grappling with the higher studies requiring the more complete knowledge. A few will go beyond and raise themselves from the workman grade to that of the professional man.

The courses arranged will be progressive, the more elementary being suitable for the machine and bench hand and the higher for the leading hands, shop foremen and others.

An important question is the period of the day when such courses should be given. Up to a comparatively recent date it was assumed, almost without question, that the only time available was the evening after a full day's work had been done in the commercial workshop. For those who have attained to the position of leading hand or shop foreman it is probable that this is still the only available time. But for the juniors who have only recently left school and who are yet in their teens it is now widely recognised that such evening work involves a strain to which the majority of youths whose physical development is still immature should not be subjected, and the existence of which goes far to neutralise the educational benefit which should result. For these students "time off" during working hours is absolutely necessary, and it is indeed probable that, in the near future, legislation may require that such time off shall be given. The Minister of Education has already spoken of this.

Such proposals raise social and other questions which it would be outside the limits of this paper to discuss, but, from the educational standpoint only, the definite opinion may be expressed that compulsory attendance of the juniors in engineering works at afternoon classes should lead to valuable educational results.

At this stage it is relevant to speak more fully of the splendid work done by the Aeronautical Society in its students' section in the series of ten lectures delivered during the past six months at the Hendon centre and afterwards repeated at Cardiff. No excuse is needed for mentioning so recent a departure, for it is very probable that there are many, even members of the Society, who have not realised the educational significance of this work.

The lectures at Hendon were delivered in a conveniently placed public hall to the employees in the numerous and important works and aerodromes congregated in the neighbourhood. No charge was made for admission. In each case the lectures were given by well-known experts in the particular subjects dealt with, and usually a well-known member of the Society presided, our worthy President being in the chair at the first meeting.

Such a series of lectures repeated throughout the country in the various industrial centres devoted to aeronautics may well be regarded as having two principal objectives, though their influence will, it is certain, be much wider. The first of these objectives is the building up of a strong students' section for the Society itself. These students' sections, in more than one of the professional societies, have been a distinct success. They are essentially democratic, being organised and conducted under the ægis of the Society by the students themselves. Ordinary members of the Society are not allowed to attend the meetings with the one exception that at each meeting the chair may be, and usually is, at the invitation of the students, taken by a prominent member of the Society. The idea is that the meeting-room should not be filled with expert critics before whom the students would be unwilling to air their original, if somewhat crude, notions. As a rule a student who has had special connection with a definite part of the subject is put up to read a paper. Other students diligently get up as much as they can of the subject in the time available and mercilessly criticise their colleague. The chairman acts as a moderator, and, whilst not sparing in his criticism, it is hoped, and, as a matter of fact, as a rule, it usually so happens that he criticises with the necessary courtesy and consideration.

The other object which the lectures at Hendon and similar lectures may be regarded as serving is the popularising and stimulation of further study amongst those actually engaged in the lower ranks of the industry. Incidentally, such lectures must lead to the desire on the part of the more ambitious, who, we may hope, in this industry will be the majority, to systematise their knowledge by attendance at well-organised technical courses. Should this object be attained, nothing but good can result to the industry as a whole.

One need not dwell at length upon other and obvious advantages in such courses of lectures, not the least of which is the personal intermingling of so many young men with similar aims who will be the standard-bearers as well as the chiefs and captains of industry in the not very distant future. An intimate knowledge of those who are to be either directly associated with oneself or to be one's competitors is not the least effective factor in a successful career in any large industry such as that we are considering.

Turning now to the second category for whom special educational facilities should be provided, aeronautical lectures, laboratory and drawing office classes dealing with the subject-matter outlined in the syllabuses will be the first essential and will meet the requirements in many cases.

For many such students, however, still more specialised instruction in aeronautical engineering is desirable, and indeed necessary. For this purpose occasional or visiting lecturers or instructors with special qualifications should be appointed both for day and evening work. Specialists must be brought in. These lecturers should be intimately connected with the design and construction of aeroplanes as part of their regular daily work, and should be men who have themselves received a sound and thorough technical training in the advanced as well as the more elementary fundamental principles of engineering theory. In other words, they should be highly trained on the theoretical side as well as on the practical side. Moreover, an endeavour should be made to select men with a special knowledge and skill in particular branches of aeronautics, and special lecture or instruction courses should be arranged accordingly. The following are some of the subjects in which such instructors may be required for lecture and design classes :—

(1) General aeronautical engineering.
(2) Fuselage design.
(3) Aero-engines.
(4) Aero-propellers.
(5) Magneto-electric ignition and other auxiliary electrical devices.
(6) Meteorology and the meteorological conditions during flight.
(7) The behaviour of aeroplanes in the air and aircraft performance treated by an expert engineer-aviator.
(8) Dirigibles and lighter-than-air machines.

This list is not exhaustive, but typical.

The above are suggestions for consideration based on some experience, with successful results, in providing special lectures with expert instructors in specific subjects. It will be well understood, however, that the highly special work, some of which is outlined, cannot be fully taken advantage of by individual students until the elementary and the higher general engineering and aeronautical work have been fully assimilated. It has become too much the fashion in some quarters to advertise and give special lectures in aeronautics without realising that such lectures are not likely to be of practical value until they are developed into special treatment on the drawing board, in the laboratory, and in the shops.

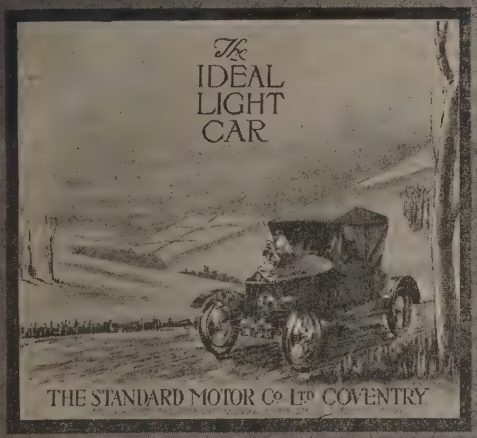
For the best results the specialised lecturer in some of the above subjects should also conduct the design or drawing office class for his special section of the work, or failing this, the class should be taken by another properly qualified designer with intimate knowledge of his subject.

Research Assistants and Scholarships.

There remain two other sections of the subject to which it is important that some reference should be made, namely: (i) research and (ii) scholarships, and these may well be taken together. It has already been pointed out that much of the laboratory work in aeronautics at the technical colleges will necessarily be of the nature of research work, and in order that this work may be efficiently carried out it is essential that the ordinary teaching staffs should be strengthened by the appointment of

(a) Research assistants.
(b) The establishment of senior scholarships and research studentships.
(c) The establishment of junior scholarships.

on the lines set forth in a Report issued last year by the Committee of the Privy Council for Scientific and Industrial Research, now the Department of Scientific and Industrial Research.



These additional assistants should act under the direction of the professor or head of department, who would suggest lines of research in addition to those suggested by the assistants themselves. Suggestions for researches from other quarters such as the Aeronautical Society should also receive every consideration, and, where funds are available or can be provided, a serious effort should be made to enlist the direct interest and support of the local education authorities.

In view of the fact that the research assistant would be appointed to work at a particular college, it is recommended that, as the success of the work would depend very much upon the qualifications and personality of the assistant, his selection should be made by the technical college concerned, and on no account by competitive examinations. The donors of any funds for providing the research assistant would, of course, be consulted.

A suitable research assistant having been appointed, he should give his whole time to the work, but in the general interest of

AVIATION KIT
AT
Dunhills Ltd
2, CONDUIT STREET, LONDON, W.

THE equipment of the Aviator must always be of the Best. Not only must his garments be as warm and serviceable as money can make them, but the cut and finish must be of as high standard to match. Just as the Government spare no expense to provide what they consider the best for the Flying Service, so to supplement what the Government issues DUNHILLS put all their experience and skill into giving the Best Quality and the Best Value.

THOSE who do not possess our Catalogue should write for one at once.

THOSE who do not know our shop at No. 2, Conduit Street should look in next time they get leave.

Godbolds,

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

aeronautics it should be possible for his services to be utilised for teaching work in aeronautics for a certain number of hours during the teaching session. This arrangement would be advantageous in giving the assistant a very vital grip of the general aspects of his subject, and would be specially useful to him as well as to the teaching profession if he intended later to become a teacher of aeronautical engineering.

It is, of course, assumed that the assistant appointed would be well qualified for research work, and that he would not necessarily require any considerable proportion of the time of the head of the department, otherwise he would be of doubtful value.

With respect to (b), it is as well to emphasise the difference between research which might be done by technical students, and research which should be done by a research assistant, the former being of the nature of training in methods of research rather than the actual undertaking of new work, which would be the proper function of the research assistant. It is, therefore, desirable that, in view of the importance of their other work, senior students during the last years of an ordinary engineering course, not necessarily aeronautics, should be trained more in methods of research rather than in actual researches for publication occupying a disproportionate volume of their time.

It is also recommended that selected students who have completed an ordinary or other approved course of training should be appointed "research students" with a small maintenance allowance, less than that allotted to research assistants, the necessary funds to be provided from the same source as the funds for research assistants. In course of time this procedure may prove of material assistance in the selection of research assistants.

There will be no difficulty in a fair number of subjects for research being suggested in any large engineering department, and researches may also be suggested by manufacturers. With regard, however, to the latter source of inspiration, it is recognised that engineering manufacturers in both small and large ways of business must have a number of problems from time to time requiring scientific investigation, but whether these manufacturers would be willing to submit to the publicity consequent upon the acceptance of public money for the purpose of the carrying out of an investigation appears to be very doubtful. In other words, manufacturers may be expected to be willing to suggest and assist in a research provided they can reap the sole benefits of the results, but may not be so willing if it be a condition that the results are to be publicly published and placed at the disposal of their trade rivals.

With respect to (c), junior scholarships should be awarded to selected evening students who have, with marked success, attended evening classes or courses for, say, two or three sessions. These scholarships, with a small maintenance allowance, will permit their holders to attend a course in the day time.

The above does not by any means exhaust the subject of the training of aeronautical engineers, but the authors trust that they have dealt sufficiently with the main lines to stimulate discussion and to bring this important aspect of the subject in precise form prominently before their engineering colleagues.

They hope that the next and subsequent sessions of the Universities and the technical colleges will witness a great development all over the country in the direction of providing sound instruction courses in aeronautical engineering.

If this hope be realised, the time spent by the authors in the preparation of this paper will not have been spent in vain.

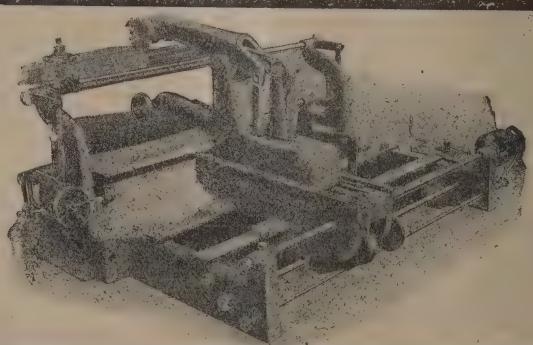
THE DISCUSSION.

MR. BERRIMAN, in calling upon MR. HENRY FOWLER, Superintendent of the Royal Aircraft Factory, to open the discussion, expressed his sympathy with all those who had missed the lecture, and hoped that the small audience would make a good discussion.

MR. FOWLER said he was very interested in the lecture from a practical standpoint. He had himself taught for several years in evening classes It was a matter of grave concern to him that the fellows who ought now to be receiving technical education were doing their obvious duty in other directions. He could see no young men coming along who could be given proper training in engineering.

He thanked Dr. Walmsley for the broad way in which he had handled his subject. He felt that so frequently in technical institutions the teacher loses sight of the man in the student, and it is the difference between the student and the man which makes this educational question so difficult.

He felt inclined to join issue with the authors as to how youths should start their technical education. The system at Derby was to have a man 12 months in the shops before sending him to a technical college. The meaning of individual responsibility was not sufficiently impressed upon students in college, but they appreciated this point in a works. He preferred a period in the shops, then college, and then a finishing in the shops.



He appreciated very highly the Aeronautical Society's lectures to aircraft workers, and was sorry that it had not been possible to hold the suggested course this summer at the Royal Aircraft Factory, but he hoped this would be done in the forthcoming session.

He thought that we must look to the teacher as well as the student. In various places the teacher is not always the right man in the right place. It was very largely a question of money

and patience. He thought that those who were teaching the masses were doing one of the noblest works for the nation.

The Chairman, in calling upon Dr. Bairstow, F.S.R., to speak, said that this was the first opportunity of congratulating him upon his election to the Royal Society.

Dr. Bairstow said he quite agreed with what the lecturer had said. He thought that by the time a student had made his position good it was too late to test his ability by a process of examination. He thought that the practice of watching a student's first year's course is the only way in which his ability to carry on independent research may be gauged.

He referred to the reactionary effect of aeronautical training upon the training for other forms of engineering. He thought that in future most examples of rigid dynamics would be taken from aeronautics. Aviation is almost a godsend to students of rigid dynamics. The aeroplane clearly demonstrated the several motions of translation and of rotation. It also demonstrated the action of couples.

Lieut. Low, R.N.V.R., in one of his usual gracefully turned speeches, agreed that the subject was a gigantic one. It covered about half human nature. There were students of two classes, those who were capable of abstract reasoning, and those who were not. He thought that there were only about half a dozen scientists who could determine practical results by abstract reasoning. The spiral nose-dive had been predicted by Professor Bryan before it was experienced by pilots. He therefore came within the category, and Mr. Bairstow's election to the Royal Society demonstrated that he also possessed this gift.

Colonel Vilamil protested against the usual method of teaching mechanics. He gave illustrations of the manner in which elementary students are confused and befogged with what appears to be an almost perverse ingenuity. It was obvious that this distinguished mathematician had the entire sympathy of both audience and lecturers, although his exposition of the parallelogram of forces more resembled an inebriated spider than a mathematical proposition.

Lieut. A. P. Thurston, D.Sc., paid a tribute to the work of Dr. Walmsley, and laid particular stress on the very great services which he had given to aeronautical education. He was particularly interested in the syllabus laid down in the paper, which displayed many points of similarity with that of the East London College.

Dr. Thurston continued by urging the difficulties that lay before those who undertook research in aeronautical science, and claimed that these could only be overcome by attacking them with due modesty and appreciation of their abstract nature.

Capt. Kennedy said that we stood to-day in aeronautics in a somewhat similar position to that which was experienced some thirty years ago in electricity. It was not until the electrical industry organised itself that progress was made. He was emphatic that in aeronautics the problem of education must be tackled by some responsible and competent person.

Mr. C. Borlase-Matthews urged the importance of imagination in experimental and research work.

Mr. Larard, in replying to the discussion, said he had little to add to what he had contributed to the paper. Colonel Vilamil would be glad to know that he quite agreed with his views on teaching mechanics. As regards Dr. Thurston's comments as to the similarity in the syllabuses of the Northampton Institute and those of the East London College, that was a case of two minds thinking alike.

He laid emphasis upon the importance of education in relation to the commercial aspects of aviation.

Mr. Berriman paid a deserved tribute to the excellence of the paper and the discussion.

Dr. Walmsley, in reply, again drew attention to the serious question which must arise in the future in the direction of the industry. Three and four year students in engineering colleges were absolutely non-existent, and the direction of the engineering industry in the future gave him grave anxiety.

THE AIR RAID AGITATION.

If the German Flying Corps will only keep up its aeroplane raids on London a little longer, it will do this country a real service. After every raid public feeling grows stronger and stronger, not, curiously enough, in wild fury against the Germans, but in strong, deep anger against the official people who have paltered and messed with our Flying Services, and so have failed to put up an adequate offensive-defensive.

Casual conversation with all and sundry while the heat of Saturday's insult was still upon them proved quite clearly that the demand of the people of London is for the invasion of Germany by air. Undoubtedly the line of action, which is now commonly known among the public as "the Pemberton-Billing Policy," is the only one which will appease popular anger against official dilatoriness in the past—and at present.

As I pointed out a fortnight ago, the Air Board has the finest opportunity of doing a great national service that has been vouchsafed by Fate to any body of men in the past century. But unless very drastic action is taken immediately, that opportunity will be lost. The Air Board has evidently the best intentions in the world, but its operations are hampered by conservative and reactionary officials and officers, and by incompetence and intrigue among minor officials, whose actions are obviously unknown to men in the position of Lord Cowdray and Sir William Weir. Until these malign influences are removed, and until production and technical matters generally are handled by departments which are efficient from top to bottom, we cannot reach our maximum output, and so cannot carry out effectively that invasion of Germany which alone can satisfy public demands.

There is little enough fault to be found with most heads of departments themselves; it is in the middle and lower grades that the delays and intrigues occur. The choice of efficient subordinates is a special gift possessed by few men, and the head of a department to be an outstanding success needs to have highly developed critical and judicial faculties rather than to be himself a skilled technician or an originator. Receptivity rather than constructiveness is the desideratum in a departmental chief. In lack of ability or willingness to receive and judge new ideas and in lack of ability to criticise and judge the work of subordinate officials lies the weakness of the Flying Services.

The progress made under the Air Board, as at present constituted, is remarkable when compared with anything which was ever done before, but there is still much more to be done before we reach our maximum output of aeroplanes and engines, and so achieve the best possible results in the invasion of Germany. Both mental and material sources of supply remain untouched. Ideas and designs offered freely by people who happen to be antipathetic to individual officials are turned down, regardless of their intrinsic worth. No use is made of people who might be useful, because they happen to be unpopular personally.

When conservatism breaks away from its prejudices and makes up its mind to use everyone and everything that can help to defeat Germany, then, and then only, will it be possible to say to the British people that the best has been done for them. And then only will the present angry state of the public mind be unjustifiable.

Popular Misapprehensions.

The endeavours to attack the last batch of raiders by the R.N.A.S. and R.F.C. were eminently commendable. Home Defences and Dunkirk alike deserve congratulation on their good work. Everything is moving in the right direction, but until Germany itself is attacked, public agitation will continue

There is so much lack of comprehension as to the work done by the Services that a few words of explanation seem desirable. In the first place, thousands of people in London would swear cheerfully that they themselves counted anything between 35 and 50 German aeroplanes over London. It is true that there were somewhere between 30 and 50 aeroplanes over London, and none knows it better than the Germans who were there. But—and this is what Londoners and other critics of the Services do not understand—something like half of those machines were British.

Now consider this point. The German plan of attack depends on an East wind—the stronger the better. The big Gotha machines, for all the sneers cast at them by supercilious official technicians who have produced nothing themselves, have a high speed and magnificent climbing power. Assisted by a strong East wind, the elapsed time between the arrival of the first warning from the East Coast at Home Forces Headquarters and the arrival of the attacking squadron over London is thus the shortest possible.

By this means as little opportunity as may be is given to the Home Command of sending its warnings to the aerodromes, and consequently the defensive aeroplanes have but little time to go aloft and reach the altitude of the attacking force, which is then flying low, being laden with bombs and with petrol for the journey homeward. When the bombs are shed and much of the petrol is consumed, the German machines, thus lightened, are able to climb to heights which only the best of our machines can reach, and where they are difficult for anti-aircraft gunners to see and hit, despite the slowness of their speed over the ground against the wind.

Now, the fact that the German squadron arrived over London with almost an equal number of our machines in attendance proves firstly that the work of the observation posts was done with the most commendable

smartness and efficiency, and secondly that the R.F.C. men turned our their machines with the utmost promptitude. The further fact that the machines were so packed together as to lead people to believe that they were all one force is *prima facie* evidence of the gallantry of our pilots, who, in spite of being mostly mounted on small single-seaters, did not hesitate to attack a much more heavily armed force.

The comparative immunity of the Germans from harm is explained by the simple fact that, flying as they were in beautifully correct squadron formation, they formed a solid compact mass, bristling with machine-guns in every direction, so that any attack by lightly armed single-seaters stood about as much chance of success as the attack of the bravest Dervishes on a British square in the Soudan. The really astonishing thing is not that the German force got away, but that our own casualties were so light.

A Useful Lesson.

The truth is that we were fairly beaten, not in the gallantry of our pilots, nor in the efficiency of our intercommunication service, but simply in that quality of foresight so highly extolled by Colonel O'Gorman in the recent Wilbur Wright Lecture, and in the organisation which should have attended that foresight if it had existed.

We have known ever since the war began, and before, that such raids were coming some day. In fact, we ourselves showed at Düsseldorf and Cologne and Friederichshafen how such raids could be made. And instead of developing that line of attack we left it to the enemy.

When we did appear to be threatened with intelligence for a time, as when certain raids were made from Eastern and Northern France, the excellent work of the junior officers and men on the spot was spoilt by the most lamentable mismanagement by inefficient seniors, and by people on this side of the Channel. The enemy learned from our mistakes, and has shown us how the business can be done with proper organisation.

The Triumph of the Big Aeroplane.

Perhaps the most useful lesson to be learned is that, besides being the only type of machine worth considering as a bomb-dropper, the big, heavily armed, multiple-engined machines are practically impregnable to attack by small machines, so long as they keep their formation. Some of the best brains in the Services have held this opinion for a considerable time, but they have been outvoted by the much larger number of "experts" who have never seen a big machine, who have never flown on active service, and who have not the intelligence to envisage the vast possibilities of the type. And in this the "experts" have had the backing of the sporting pilots, whose one idea is a big engine with the smallest possible fringe of aeroplane round it. The small aeroplane has its uses—none appreciates it more highly than I do—but it also has its limitations, and among them is its uselessness against a strong formation of heavily armed big machines.

So far as big aeroplanes are concerned, we are far in front of the Germans in everything except quantity production, and we may easily lead them in this also if the subject is tackled with real energy and intelligence. This is a matter for the Air Board, and it remains to be seen whether Lord Cowdray and Sir William Weir will take the problem firmly in their own hands and deal it in the light of their own engineering experience, or whether they will allow the half-baked scientists who pose as technical and engineering experts to palter with the business till the whole thing is out of date, as has been the almost invariable rule with every new idea hitherto.

The Political Aspect.

All the papers have been so full of what has been said and done and thought and suggested by politicians that it is not worth while to deal at length in this paper with the political aspect of the question. One may, however, be pardoned for lamenting that the "dud" shell imported by Sir Henry Dalziel into the House itself retained its latent energy under examination. Not that one wishes any harm to Sir Henry, but there must have been quite a number of other M.Ps. within its range whose removal would have been a national service. Probably it was just as well to burke public discussion by holding a Secret Session on Monday night. All that need be said to the public can be said by members of Parliament to their own constituents when they have the courage to go down and explain to them why, after all these years of warning, the House of Commons permitted the Government to retain in power the particular individuals who have made such a failure of certain of the work of the Flying Services.

One could easily name half a dozen people whose removal from the Flying Services would increase the value of those Services by a very high percentage. Their removal would be followed automatically by the dismissal of half a hundred inefficient subordinates, who are only retained in their positions by favour of the half-dozen. And then the really good men would have a fair chance of putting things right, without hindrance from the inefficients. At present the chief trouble is that the many excellent men under the Air Board spend so much time putting right the idiotic mistakes of others, or in trying to prevent them, that their own constructive work is seriously hampered.

If only the Parliamentary Air Committee would grasp this simple fact and insist on internal reforms, then we should be able to carry on air war with immediate prospect of real success.—C. G. G.

The Secret Session.

The following is the official report of the proceedings at the secret session of the House of Commons on Monday night:—

The **Prime Minister** said that it was better first of all to give briefly a summary of what actually happened. Twenty-two German machines of the Gotha bombing type, carrying about 800 lb. of explosives apiece, came over London. Of these, three were destroyed, one by the machines actually protecting London. Besides this, out of the protecting squadrons which the Germans had organised in order to assist the return of the raiding squadron, six machines were destroyed and one injured. The attack, in fact, had not been made with impunity. He wished to point out that the first fact which the House should get into its mind was that complete protection in the air could never be secured.

At the front our machines were every day crossing over the German lines, and, in spite of the most terrible anti-aircraft fire and very powerful German air squadrons, they were yet able regularly to bomb stations and headquarters behind the German lines. If that could be done in a region where the German aeroplanes and anti-aircraft strength were most closely concentrated and could be done daily, then the House would realise that no measures that we could take would give complete immunity. The nearest approach to immunity lay in making their visits so costly that they would not become worth the Germans' while. He wished to point out also that during the last four or five months our naval bombing aeroplanes had dropped over 70 tons of explosives on the German aerodromes in Northern Belgium and had dropped six tons on those very aerodromes on the night before the raid, whereas the total amount dropped by the Germans here was only some two tons.

The first consideration before the Government was to see that the Army in France was sufficiently supplied with aeroplanes. A sufficiency of aeroplanes meant everything to that Army. They were the eyes of the Army, which could not advance without them. By their means the Army discovered the enemy's trenches, guns,

and machine-gun emplacements. To photograph these required air supremacy, and without that air supremacy it was sheer murder to allow troops to advance. The 28 fatal casualties which had been suffered by the civilian population in the last raid were very regrettable, but unless our troops at the front were supplied with aeroplanes in sufficient number to secure a proper knowledge of the German trenches and positions and to guide the artillery barrage their losses might easily be not 28 but 28,000.

The slightest deficiency in the aeroplane work, a single machine-gun emplacement overlooked, might in a few minutes mean the loss of thousands of gallant lives. The first duty of the country was to protect these men. The Germans realised the importance of this question quite as much as we do.

The second means by which they were attempting to diminish our superiority was by trying to force us to withdraw our machines from France in order to protect our own towns. If the Germans knew that by bombing English towns they could force us to withdraw fighting squadrons from France, there could be nothing which would encourage them more. Nothing could be more disastrous to the conduct of military operations than anything which encouraged the Germans to believe that by these raids they could excite such a clamour in this country that the Government could not resist the demand for the withdrawal of aeroplanes from the front. If the aeroplanes could be provided both for the front and for our defence against raids that would, of course, be done. If not, the Army must come first, and it was vitally important that the Germans should know it. He feared that some of the articles which had appeared in the Press might prevent the Germans knowing it. He had seen something of the people in the district which had suffered from the raid a few hours afterwards. He had never seen people face disaster with greater cheerfulness and constancy. He saw no signs of panic anywhere. That was the impression left not only on his mind, but on all who were with him. He was certain that if the people of this country realised that for the moment all our strength had to be put into establishing supremacy in the air in order to win victory at the front they would be prepared to take risks which, after all, were not comparable to the risks run by our soldiers.

The Germans were just as alive to the importance of supremacy in the air as we were. They had put forth prodigious efforts in the last 12 months. In the last six months we had enormously increased our capacity for turning out machines. We had extended existing works and built new ones, we had added over 25,000 men to the number of employees in those works, we had quickened production by improved methods of organisation and had enormously improved the type of machines. The Government's information was that the German capacity of production was not adequate to compete with the provision which they had made. Hitherto, however, the increase had only been gradual, as the measures taken at an earlier date by the Air Board and the Ministry of Munitions had not yet had time to reach their full fruition, but our production was now going up by leaps and bounds. We should, indeed, have been far better off at this moment but for the strike in April last, which lost us between 150 and 200 machines.

The Government now hoped soon to reach a state of things where it was possible not only to meet what must always be the first charge upon it, namely, the requirements of the Army in France, but also to provide sufficient aeroplanes to make it impossible for the Germans to come over here without losses which would persuade them that it was not worth while to do so. It was a very easy matter to go to poor people who had suffered and suggest that a raid like this was due to the negligence and carelessness of the Government, but he believed if those people were told what the situation was, they were capable of rising to a great appeal. If they were told that it was necessary to run some risks for a short time for the sake of the gallant fellows in France, they would do so cheerfully. It was only for a very short time, and he was confident that we could then not only secure supremacy in France, but also equip Lord French in such a fashion that if the Germans came over again they would deem it the part of wisdom not to repeat the attempt.

The Prime Minister concluded by moving the adjournment of the House.

THE DEBATE.

Mr. Joynson-Hicks suggested that if it was good business for the Germans to spare machines to bomb us and strike at the centre of our fighting forces it might be good business for us to spare machines in order to do the same. He suggested that more labour might be spared for the making of aircraft from other branches of munition work. He criticised the actual measures taken to cope with the raid, and asked for an inquiry.

Sir H. Dalziel also criticised the actual steps taken on Saturday, supporting the demand for an inquiry, and elicited the information that none of the raiders had come over London at a lower altitude than 13,000 ft. It was due to the great size of the machines that they appeared to be lower. He insisted that the expansion in our output of aeroplanes should have been secured earlier.

Colonel Sir J. Norton Griffiths pointed out that while it was possible to secure effective command of the air in the battle zone, it was impossible to secure a general command of the air. Even in the battle zone it was impossible to prevent enemy aeroplanes from coming over our lines. He gave his own experiences confirming the vital point that we maintained our supremacy at the front.

Mr. Claude Lowther asked for more cohesion between our air and land defences.

Sir W. Pearce expressed the view that the Government ought to take further steps for the defence of London.

Lord Hugh Cecil pointed out that London was far more accessible to the Germans than any large German centres were to us. We could bombard Brussels if we chose, but that would only injure a friendly population. The air problem was a purely military problem, and the judgment of the military experts ought to prevail.

The Chancellor of the Exchequer, answering questions put by **Mr. Lambert**, said that in the opinion of our experts our types of machines were as good as the Germans. He profoundly disagreed with the view expressed in the debate that the Prime Minister's speech might have been made in public, as the most vital though not the longest passages in it were essentially of a secret character. He pointed out that the French section of the Allied front was much nearer to important German cities than ours, and that it was therefore natural that the French should play a larger part in offensive operations against their cities, as indeed they had done with great success and remarkable immunity during the last few days, 84 machines having heavily bombed six German towns with only two casualties. He certainly did not treat these raids on London as of no importance, but it was the balance of military advantage that had to be considered, and if a choice had to be made the Army must come first. When people demanded the instant production of vast numbers of aeroplanes they were apt to forget the inherent limits to the extent and rate of such an increase and the imperative demands of other services.

The motion for the adjournment was talked out, and the House adjourned at 11.7 p.m

[The official report above is of purely historical interest, and has little real bearing on the situation, the statement by the Ministers, and the debate, having been edited and censored till all important matter has vanished. One learns unofficially that the proceedings closed when Mr. Pemberton-Billing had told the House a few home truths. The Party Whips then, apparently, withdrew their obedient partisans, and the House was "counted out."—Ed.]

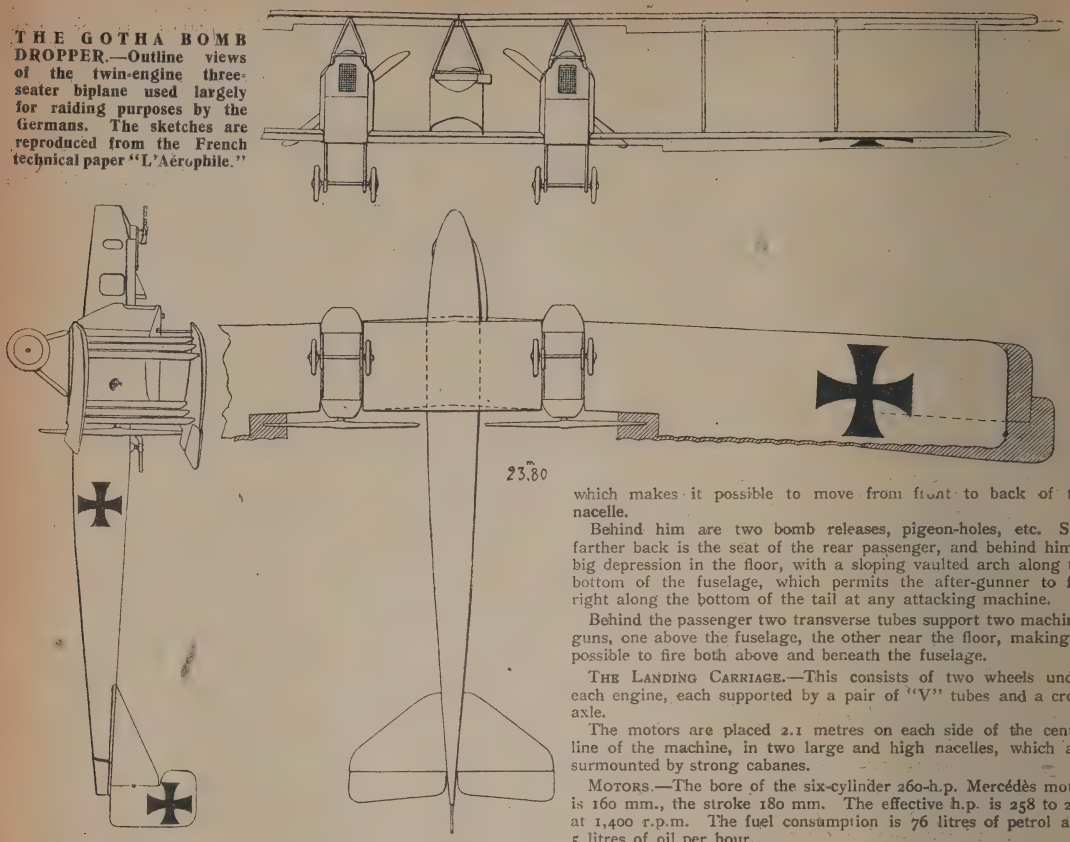
The Twin-Engined Gotha Biplane.

The following description of the Gotha bomb-dropper is taken from "L'Aérophile," of June 15th, M. Lagorgette having been given an opportunity of inspecting a recent capture:—

The span is 23.7 m. (77 ft.) and the length 12.45 m. (40 ft.).

The machine under discussion was the three-seater recently brought down by Capitaine Georges Guynemer. M. Lagorgette says that it does not give one the impression of being well tuned-up, and apparently the design has been modified without being remodelled. Without doubt, in the course of its construction, he says, several inspirations were imbibed from the Handley Page 500-h.p. Rolls-Royce 30 metre biplane captured by the Germans.

WINGS.—These are nearly equal in span, with projecting ailerons; there is a slight dihedral, but no stagger; there is a slightly arrowed shape, and the wings are nearly rectangular, and are cut away to a considerable extent along the centre part of the trailing edge so as to make room for the pusher air-screws.



The ailerons are balanced, an angular portion extending past the wing tip and forwards acting as a compensator or balance. There are three pairs of struts on each side, besides those supporting the engines.

The elevator and fixed tail-plane have a semi-hexagonal plan view. The rudder is nearly rectangular, with a balanced portion projecting above the triangular fixed fin.

The fuselage is mounted on the lower wings and is rectangular in section, and of three-ply in front. The gunners, both front and rear, can fire downwards through trap-doors. In a compartment between them are three bomb releases. One pair of wheels are placed under each of the two motors, which are stationary Mercédès of 260 h.p. with six cylinders. The two airscrews are pushers, contrary to the usual German principle.

The height of the machine is 3.85 m. (about 12 ft.).

The span of the lower wings is 21.95 m., nearly equal to that

THE GOTHA BOMB DROPPER.—Outline views of the twin-engine three-seater biplane used largely for raiding purposes by the Germans. The sketches are reproduced from the French technical paper "L'Aérophile."

of the upper plane (23.7 m.), which includes the width of the ailerons, which are only on the upper planes.

The chord of the upper wings (2.3 m.) is slightly greater than that of the lower (2.2 m.) and they narrow gradually.

The gap is 2.17 m.

The total surface 95 square metres.

The length of the ailerons is 3.85 m. For 3.37 m. they increase in depth from 0.67 m. to 0.82 m.; for 0.48 m. they are 1.32 m. deep, where the overhanging section of the aileron is made deeper so that it will act as a counterpoise. The surface of each aileron is 3 square metres.

The upper plane consists of two halves, which are attached to the cabane, which is trestle-shaped. The lower plane has a long central section without dihedral or sweep back, which goes underneath the fuselage and at its extremities supports the motor units.

The attachments consist of simple wires with turnbuckles.

The spars are of I section with three-ply on the sides. They are cross-strutted by tubes.

The ribs indicate nothing new. They do not extend to the leading edge, which is attached solely by its own edges. Being at right-angles to the leading edges, which form a "V," they are not parallel to the axis of the machine.

For this reason the three pairs of struts which are found outside each motor have the peculiarity that the rear struts are not situated immediately behind the front struts, but, nevertheless, the streamline section of each faces the line of flight.

The fabric of the wings and of the tail is unbleached linen.

The Tail.—The fixed stabilising plane, or tail-plane, consists of two nearly triangular halves, the two elevator flaps are nearly rectangular, but taper slightly in width towards the centre.

The fixed tail-plane is triangular, held at four points, and extends to the rear of the fuselage, and behind that, above the level of the fuselage, is found the rudder, a rectangular member, the top portion extending forwards as a compensator.

The Fuselage.—This is a single body of rectangular shape, with a three-ply nacelle which is very prominent in front. There are four ash longerons, with formers, or cloissons, on ash frames, with stringers to support the fabric.

The arrangement of the nacelle is not symmetrical. The front passenger sits nearly on the centre line of the machine, but the pilot with his controls, a wheel operating a chain and a rudder-bar, is placed to the left, which leaves on the right a passage which makes it possible to move from front to back of the nacelle.

Behind him are two bomb releases, pigeon-holes, etc. Still farther back is the seat of the rear passenger, and behind him a big depression in the floor, with a sloping vaulted arch along the bottom of the fuselage, which permits the after-gunner to fire right along the bottom of the tail at any attacking machine.

Behind the passenger two transverse tubes support two machine-guns, one above the fuselage, the other near the floor, making it possible to fire both above and beneath the fuselage.

The Landing Carriage.—This consists of two wheels under each engine, each supported by a pair of "V" tubes and a cross axle.

The motors are placed 2.1 metres on each side of the centre line of the machine, in two large and high nacelles, which are surmounted by strong cabanes.

Motors.—The bore of the six-cylinder 260-h.p. Mercédès motor is 160 mm., the stroke 180 mm. The effective h.p. is 258 to 260 at 1,400 r.p.m. The fuel consumption is 76 litres of petrol and 5 litres of oil per hour.

Each cylinder, precisely similar in appearance to the 175-h.p. type, is isolated, with its own water-jacket connected by a joint to its neighbour, and fixed separately to the crankcase, the six cylinders being in line.

A single carburettor, instead of the duplex pattern on the 175-h.p., and the two separate carburettors on the 235-h.p. models, feeds the six cylinders.

Two magnetos are driven by the vertical shaft which operates the camshaft. There are two plugs per cylinder and four valves. A half-compression device is fitted for easy starting.

There is a honey-comb radiator in front of each motor, and a petrol tank in each engine nacelle.

Armament.—The armament consists of three machine-guns, one in front in a turntable ring, which will fire through a hemisphere in front and a little over, above, and below. A second gun is mounted, as in the Aviatik, upon a transverse tube at the top of the fuselage, and behind the rear passenger, which can fire nearly vertically above and nearly perpendicularly below the machine.

A third, mounted similarly upon a transverse tube near the floor of the machine at the edge of the arched opening, makes it possible to fire underneath the vaulted fuselage, or obliquely to the sides, or to the rear.

The bomb-dropping instruments carry 14 bombs in all. One in the front of the fuselage, an affair with spring jaws, contains two bombs lying longitudinally.

Two others placed between the pilot and the rear passenger contain six bombs each, piled one upon the other in a rectangular chamber, so arranged that as the lowest bomb is released, it is followed successively by the other bombs.

MEDICAL COMFORTS BY AIR.

It is reported that the war organisation of the British Red Cross Society and the Order of St. John includes an aerial parcel post service. The following is an extract from a summary of work in Egypt which has reached the headquarters of the Joint War Committee at 83, Pall Mall, S.W.:—

"An aeroplane leaves a certain point in the Canal Zone daily, and carries such Red Cross comforts as fans, fly whisks, chocolate, gramophones, etc., to outlying medical units in the desert."

AFTER THE WAR.

BY "BERKELEY."

Even the pessimists who have done so much to assist this country in its march towards victory must perforce admit that in the fullness of time the present war will end, and peace will again become the habit of Europe. The war, after it had run a year of its course, was the cause of an almost complete revolution in the manner of life common to the greater mass of the people in this country. Those who were fit and available for service passed into His Majesty's Service that they might take an active part in the disintegration of the Germanic Empire. Others, unfitted by age or physical disability for active service beyond the seas, took up arms in the maintenance services attached to the forces. Others, again, from the highest to the lowest in the land, engaged themselves in the manufacture of munitions of war. Many who were prevented in various ways from directly aiding the country in its warlike endeavour remained in their seats of business, working under conditions of unusual stress, that commerce and its many offshoots should suffer as little as may be from the change in international conditions. Another class, variously employed, has done nothing, to the general good of the country.

The result in general is a great redistribution of money. Men and women accustomed for years past to a life of hardship, unlightened by variety and uninspired by hope, have at a bound attained an unexpected degree of prosperity. Those who were once well to do, but whose incomes could be classed under Mr. Lloyd George's broad definition of "unearned increment," have begun to tremble at the signs of the times and to shudder at the unpleasant evidence inscribed in the pages of their pass-books. There is some manner of revival of the days in which the South Sea Company, so soon to take its place in history as the South Sea Bubble, animated the thoughts of England. Footmen acquired in a moment the income proper to the rank and state of dukes, whilst dukes in the same period of time descended from their position of eminence and relied on crumbs from the Ministerial table of patronage for the means of existence. It's a world of topsy-turvy which would have delighted Lewis Carroll.

Before the War.

But in no industry or profession have things changed so much as in aeronautics. In pre-war days constructors of aircraft required private fortunes if they desired to avoid the doors of the Bankruptcy Court. Not only was support lacking, but they were regarded with similar suspicions to that surrounding a company of professional safe-breakers or a bookmaker who was known to have acquired many prizes in running matches. Those constructors who believed in the dirigible balloon had perforce to hide their thoughts, lest ill might come. The Royal Aircraft Factory alone was prosperous, while it remained the only establishment in which a profit was neither attainable nor necessary.

Those who became pilots from any reason save that of a desire to become an officer in either of the Flying Services could find no means of livelihood save in testing aeroplanes for manufacturers, or in a series of circus performances which showed a scale of profit in close relation to the degree of danger involved. Yet restricted though the employment of aviators might be, it had great promise of high profit. The skilled aviator could command an income comparable with that of a Cabinet Minister, and could claim far greater popularity with the general public.

Designers, mechanics, and others employed on construction were paid at rates little above those customary in allied industries. The entire personnel of the aeronautical industry was very limited, and increased but slowly. There was no market of any size save the Government, and, as the Government lacked belief in the paramount necessity for large numbers of aircraft in the Army and Navy, there was but little hope of rapid expansion in the trade.

The Effect of War.

The war has altered all. The aircraft industry is highly prosperous, and in size it bears comparison with its rival, the motor trade. Orders are placed in thousands, and the personnel engaged has increased to a degree which would have been deemed absurd in pre-war days. Constructors whose milk-bills were in arrear in 1914 now possess banking accounts which would be respected even by a Jermyn Street money-lender. Pilots are numbered in thousands instead of by dozens. The majority are in the King's Services, but those who are excluded for various reasons are, if still flying, earning incomes which would please a popular collaborator in revue-writing.

The war has brought its changes in the mode of life of the people. Peace in its turn will bring further changes, but few of them will be a return to the manners and customs of pre-war days. Nothing that is healthy remains stationary. Everything possessing virtue must progress. But evolution in normal times is slow. The dress clothes which clothe the gentleman and decorate the stockbroker are the development of centuries of evolution, as is the Rolls-Royce of to-day the descendant of the primeval sledge. The present war, instead of arresting development, is giving an impetus to evolution, which makes it possible almost to see the movement. Consequently, among other things, the aeronautical industry, which was in a state of unhealthy infancy at the beginning of the war, will at the advent of peace be a prosperous entity. A decade of evolution will be crowded into the three or four years of the war.

The Destiny of the Young.

There were few people in pre-war days who, when the question of their son's employment after leaving school or the university was about to be decided, would have deliberately chosen any branch of aeronautics for his career, or would have encouraged any adolescent aspirations of that kind. It was all too uncertain and too indefinite. As for boyish desire for the life of an aviator, no decently conducted family would have given even reasonable hearing to the idea. Some entered the industry by the insistence of a strong will; others because they had no discernible attributes in any other direction, if even in any direction at all.

But to-day aeronautics is a definite industry, with the promise of a life-long career to any who will work with energy and perseverance. There are many categories of work within its bounds, and it is simply a question of choosing the most suitable sphere of activity.

It is unlikely that the present divorce between the construction of engines and the building of aeroplanes will continue in the future, when peace gives the opportunity for the co-ordination of effort. The production of the entire aeroplane will justify the creation of a separate trade of aeronautical engineering, in which will be combined all questions dealing with the designing and building of aeroplanes and airships. This being so, there will be many openings for the apprenticeship of boys to firms of aeronautical engineers, exactly as is now the custom in other branches of engineering. After a short period of train-

ing, the apprentice will be able to select the particular section of the trade which appeals most to his ability. In his perseverance and skill will lie the surest road to fortune. But the point to be made is that, after the war, aeronautical engineering can be added to the list of careers to be considered by parents in deciding the future occupation of their sons. It is an industry possessing stability. The element of financial risk will largely be eliminated.

If parents do not care for the charms and historic associations of apprenticeship, and desire to complete their children's education by the acquisition of a degree at one or other of the more modern universities, there is little doubt that in the course of the next few years a faculty of aeronautical engineering will find a place in at least the newer universities. That little attention has as yet been devoted to motor engineering in places of primary education is no argument against the inclusion of aeronautics from the system of training. There is an infinity of difference between the scientific positions of the two industries.

In a lower class in life there is a new field of work for those whom the Army very correctly calls "tradesmen." For mechanics, fitters, carpenters, and all manner of workmen whose category is unknown to me there is an infinity of work, with a definite promise of continuity of employment at a reasonable rate of pay. These men can become specialists in the industry no less than are the designers and draughtsmen, both of whom, I understand, wear black coats on Sundays.

The pilot, who until the present time has largely dominated the situation by his acrobatic skill and zeal for often dangerous experiments, will descend from his high estate in future days. No longer will the adventurous youth of good family find it a convenient and charming way of making a large income. The supposition that the art of flying required a singular degree of daring is rapidly vanishing, and the days are not far distant when paid aviators will be of the degree of paid chauffeurs and motor-drivers. The great commercial aeroplanes will be controlled by the hands of drivers whose skill will earn them a rate deservedly higher than that of the man who drives a motor-'bus, but it most certainly will not be disproportionately higher. The skipper in charge will rank in all probability with those of ships on the humbler sea, but he will rarely graduate from a course at the control levers. His duty will be that of command and of navigation.

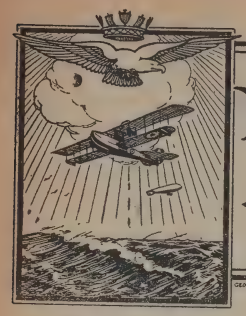
There will still be money for the aviator who flies for the public amusement, just as there is for the equestrian performers in a circus. But the pilot will no longer be the idol of the public and the hero of the night club.

I have not referred to either of the Flying Services, as the officers and men therein must be considered as soldiers and sailors in the first instance. Their livelihood does not depend on aeronautics.

THE AERONAUTICAL EDUCATION OF SCOTLAND.

One learns with gratification that Lady Drogheda's Aeronautical History Exhibition has been an immense success in Glasgow. Among recent visitors were the Prime Minister and the C.-in-C. Home Forces. Mr. Lloyd George visited the Exhibition immediately after making his historic speech at Glasgow, and Lord French, who was on a journey of inspection in Scotland, visited the Exhibiton two days earlier. Both expressed their keen appreciation of the good work Lady Drogheda is doing in bringing home to the people of Great Britain the importance of aircraft.

As the result of this excellent lead, Glasgow has been flocking to the Exhibition in its thousands, and is rapidly acquiring desirable knowledge.



The Exhibition is shortly moving to Edinburgh, where it will be on view from July 20th till Aug. 3rd, after which date it will visit Dundee, where, one hopes, Mr. Churchill will take the opportunity of telling his constituents, and the country at large, something about aeronautical affairs

WAR WORK.

Two hundred women—under 40 years of age—are wanted at once in Somerset to pull flax to be used in the manufacturing of aeroplane fabric. The work begins on July 12th, and will last for six weeks. Payment at the rate of 30s. an acre is offered, a rate at which the minimum earnings will well cover the living expenses. Good accommodation is offered, and there is a canteen, but the workers must provide certain small items of equipment. The scheme is being run by the Women's Land Service Corps for the Board of Agriculture, and applications should be made to 50, Upper Baker Street, London, N.W.1.

THE GERMAN AERODROME AT BIR SABA—the Beersheba of the Old Testament. An Aviatik is seen getting off, and a Pfalz monoplane, which is an exact copy of a Morane, is seen in the fore-air.

Admiralty, July 4th.

R.N.V.R.—The undermentioned have been promoted for services with the R.N.A.S.—Temp. Lt.-Comdrs. to be temp. Comdrs.: Cecil H. Meares, Claude Kirby, June 30th, 1917.

Temp. Lts. to be temp. Lt.-Comdrs: Philip L. Teed, George C. Neilson, George F. Herron, William Burningham-White, Edmund Hogg, Edward R. Peal, D.S.C., Spenser Flower, Edward N. G. Morris, Victor C. H. Longstaffe, Percy L. H. Dodson, Joseph E. Coates, Rowland D. Carey, Pearce Blair, Charles H. Parkes, Harold G. Atkinson, Viscount Tiverton, John K. Curwen, William J. S. Lockyer, William G. Chambers, Thomas F. Norbury, William H. Adkins, Frederick T. Ashford, Arthur Partridge, Cyril R. Andrews, Charles R. Abbott, George M. T. Rees, Charles J. Murfitt, Arthur F. Sidgreaves, Michael H. P. Allen, James D. K. Restler, James P. A. Waller, Henry A. R. Norton, Rene Bull, Alfred S. Hellawell, Arthur S. Langley, Warwick Wright, June 30th, 1917.

Temp. Sub-Lts. to be temp. Lts.: John D. Greenwood, April 1st, 1917. Joseph T. Chitty, Colin A. Crow, Herbert G. P. Rees, Charles H. Nelson, Arnold L. Howarth, Arthur B. Hatton, Bernard J. Beeton, John Ree, Sidney H. Brazier, Noel V. Wrigley, Richard F. Osborne, Clive C. Clarke, Edward A. Wadsworth, Arthur J. Osborn, Harry C. Willson, Charles F. Smith, Noel W. Hughes, James D. Fry, James D. Whitelaw, Archibald A. Bryce Buchanan, Hermes G. L. de Whalley, Arthur M. Humble-Crofts, Arthur B. Murray, Horace O. Merriman, Clement H. Swann, Percival M. Davson, John W. Morley, William T. Morris, June 30th, 1917.

R.N.A.S.—Sqdn. Comdr. to be Wing Comdr.: Wilfred Briggs, June 30th, 1917.

War Office, July 4th, 1917.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Sqdn. Comdr.—Temp. Lt. (temp. Capt.) C. F. Portal, M.C., R.E., Spec. Res., from a Flight Comdr., and to be temp. Maj. whilst so empld., June 16th, 1917.

Flt. Comdrs.—From Flying Officers: Temp. Sec. Lt. (temp. Lt.) I. G. Davies, Gen. List, and to be temp. Capt. whilst so empld., May 30th, 1917. June 18th, 1917: Lt. (temp. Capt.) G. M. Croil, Gord. H., T.F., and to retain his temp. rank whilst so empld.; Capt. E. A. de Pass, Yeo., T.F. From Flying Officers, and to be temp. Capts. whilst so empld.: Temp. Sec. Lt. (temp. Lt.) C. H. Stocks, Gen. List, June 20th, 1917. Lt. M. D. G. Scott, N. Lan. R., Spec. Res., June 21st, 1917.

Park Comdr.—Qmr. and Hon. Lt. (temp. Capt.) J. Starling, R.F.C., and to be temp. Maj. whilst so empld., May 1st, 1917 (substituted for the notification in the "Gazette" of May 24th, 1917).

Equipt. Officers, 1st Cl.—Sec. Lt. (temp. Lt.) A. D. Spiers, Spec. Res., from the 2nd Cl., and to be temp. Capt. whilst so empld., May 19th, 1917.

Memoranda.—Temp. Lt.-Comdr. Clement Rolfe Ingleby, from R.N.V.R., for duty with R.F.C., May 14th, 1917. Capt. the Hon. M. Baring, R.F.C., Spec. Res., whilst specially empld., July 5th, 1917. To be temp. Majors.

War Office, July 4th.

REGULAR FORCES.—R.F.C.—Mil. Wing.—The following appointments are made:—

Special Appointment (graded as a Sqdn. Comdr.).—Temp. Sec. Lt. (temp. Capt.) R. M. Hill, M.C., Gen. List, a Flt. Comdr., and to be temp. Maj. whilst so empld., April 1st.

TERRITORIAL FORCE.—Yeomanry.—Capt. W. S. F. Johnson, M.C., to be secd. for duty with R.F.C., April 29th.

* * *

Dispatches from Sir Archibald Murray are published covering the operations in Egypt from Oct. 1st, 1916, to Feb. 28th, 1917. During this period Sinai was cleared of the Turks, and the Egypt force won the brilliant victories of Magdhaba and Rafa, in both of which the whole of the Turkish force engaged was either captured or otherwise accounted for. These were the last important actions fought before the Battle of Gaza.

The following R.F.C. Officers and Men appear in the list of recommendations made in General Murray's dispatch:—

Staff.—Salmond, Bt. Lt.-Col. (temp. Brig. Gen.) W. G. H., R.A. and R.F.C.

Royal Flying Corps.—Bannatyne, Lt. (temp. Maj.) E. J. Burchall, Capt. (temp. Maj. in Army) H., R.F.C. (Spec. Res.); Freeman, Capt. R H., Worc. R.; Guilfoyle, temp. Capt. W. J. Y.; Kingsley, temp. Lt. S. G., Gen. List; Muir, temp. Capt. S. K.; Bradwell, 3206 Flt. Sgt. W. A.

Australian Imperial Force—Australian Flying Corps.—Jones, Capt. A. M.; Sheldon, Capt. W.; Wackett, Lt. L. J.; Gibbs, 156 Flt. Sgt. E. A., 67th Squad.; Murphy, War. Officer A. W., 67th Squad.

War Office, July 6th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Flt. Comdr.—Temp. Sec. Lt. H. P. Dean, Gen. List, from a Flying Officer, and to be temp. Capt. whilst so empld., June 23rd, 1917.

Equipment Officers, 1st Cl.—Lt. (temp. Capt.) C. Ingram, Cyclist Bn., T.F., from the 3rd Cl., and to retain his temp. rank whilst so empld., May 20th, 1917. Sec. Lt. (temp. Lt.) O. W. Latimer, from the 2nd Cl., and to be temp. Capt. whilst so empld., June 15th, 1917.

War Office, July 7th.

REGULAR FORCES.—Establishments.—R.F.C.—Mil. Wing.—Sqdn. Comdr.—Lt. (temp. Capt.) J. A. G. de Courcy, M.C., R.A., from a Flt. Comdr., and to be temp. Maj. whilst so empld., June 4th.

War Office, July 9th.

REGULAR FORCES.—Establishments.—R.F.C.—Mil. Wing.—Sqdn. Comdr.—Capt. C. H. B. Blount, M.C., R.W. Surr. R., from a Flt. Comdr., and to be temp. Maj. whilst so empld., June 26th.

Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld.:—Temp. Lt. F. P. Holliday, Gen. List, June 15th. Sec. Lt. (temp. Lt.) A. G. A. Davis, Devon R., June 20th.

Balloon Co. Comdrs. (graded as Flt. Comdrs., and to be temp. Capts. whilst so empld.). Sec. Lt. (temp. Lt.) B. G. L. Ellis, R. Guernsey Mila., from a Balloon Officer, June 9th. Sec. Lt. (temp. Lt.) J. A. Cochrane, R. Sco. Fus., T.F., from a Balloon Comdr. (graded as a Balloon Officer), June 16th.

Adjt.—Temp. Capt. A. M. Lester, Midd'x R., vice temp. Sec. Lt. (temp. Lt.) J. Rubie, D. Gds., May 18th.

Equipment Officers, 1st. Cl.—Lt. G. E. Godsave, Lond. R., T.F., from the 2nd Cl., and to be temp. Capt. whilst so empld., June 25th.

* * *

The King has been pleased to award the Military Medal for bravery in the field to the following Non-commissioned Officers and Men:—

77449 Sgt. B. Aldred, R.F.C.
5303 Cpl. E. Harper, R.F.C.
9236 1st Cl. Air Mech. H. J. Hayes, R.F.C.
4251 1st Cl. Air Mech. N. Parkinson, R.F.C.
12270 1st Cl. Air Mech. J. Thompson, R.F.C.
1197 Cpl. R. E. Tollerfield, R.F.C.

NAVAL.

The following appointments have been made in the Royal Naval Air Service :—

JULY 5th.—Messrs. G. B. Mann, A. W. Stone, and W. Seed granted temp. commissions as Lieut., R.N.V.R., all with seniority July 3rd.

JULY 6th.—Sqdn. Comdr. (Actg. Wing Comdr.).—W. Briggs, promoted to rank of Wing Comdr., seny. June 30th.

Lt.-Comdrs. (temp., R.N.V.R.).—C. H. Meares and C. Kirby, both promoted to Comdrs. (temp.) seny. June 30th.

Lts. (temp. R.N.V.R.).—P. L. Teed, G. C. Neilson, G. F. Herron, W. Burningham-White, E. Hogg, E. R. Peal, D.S.C.; S. Flower, E. N. G. Morris, V. C. H. Longstaffe, P. L. H. Dodson, J. E. Coates, R. D. Carey, H. G. Atkinson, P. Blair, C. H. Parkes, Viscount Tiverton, J. H. Curwen, W. J. S. Lockyer, W. G. Chambers, T. F. Norbury, W. H. Adkins, F. T. Ashford, A. Partridge, C. R. Andrews, C. R. Abbott, G. M. T. Rees, C. J. Murfitt, A. F. Sidgreaves, M. H. P. Allen, J. D. K. Restler, J. P. A. Waller, H. A. R. Norton, R. Bull, A. S. Hellawell, A. S. Langley, and W. Wright, all promoted to Lt.-Comdrs. (temp.), seny. June 30th.

Sub-Lts. (temp., R.N.V.R.).—J. D. Greenwood, promoted to Lt. (temp.), seny. April 1st. J. T. Chitty, C. H. Nelson, A. L. Howarth, A. B. Hatton, B. J. Beeton, J. Ree, S. H. Brazier, N. V. Wrigley, R. F. Osborne, C. C. Clarke, E. A. Wadsworth, A. J. Willson, C. F. Smith, N. W. Hughes, J. D. Fry, J. D. Whitelaw, A. A. Bryce-Buchanan, H. G. J. de Whalley, A. B. Murray, C. H. Swann, P. M. Davson, J. W. Morley, C. A. Crow, H. G. P. Rees, A. M. Humble-Crofts, and W. T. Morris, all promoted to Lt. (temp.) seny. June 30th.

JULY 7th.—Mr. H. D. Stanton, granted temp. comm. as Lt. (R.N.V.R.), seny. July 9th.

JULY 9th.—The following temp. entries (R.N.V.R.) have been made, seny. as stated :—Lieuts.—F. R. Arthur, July 5th. E. W. Wilkins, July 7th.

Mr. E. H. Cook granted a temp. commission as Lt. (R.N.V.R.), seny. July 5th.

ADMIRALTY COMMUNIQUÉS.

JULY 4th.—The Secretary of the Admiralty makes the following announcement :—

During the night of the 2nd and morning of the 3rd inst., bombing raids were carried out on Bruges Docks and on Lichtervelde ammunition depots by Royal Naval Air Service machines. Several tons of bombs were dropped in all, and good results were observed.

All our machines returned safely.

ADMIRALTY, 7 p.m.

Vice-Admiral, Dover, reports that naval aircraft from Dunkirk intercepted the hostile squadron returning from England after the attack on Harwich this morning. An engagement ensued at a considerable distance from the Belgian coast.

Two of the hostile machines were brought down in flames, and a third was seen to be damaged. Several other machines were attacked with indecisive results.

All our machines returned safely.

JULY 5th.—The Secretary of the Admiralty makes the following announcement :—

During the night of the 3rd-4th bombing attacks were carried out by Royal Naval Air Service machines on the aerodromes at Ghistelles (south-west of Bruges) and Nieumunster (north-west of Bruges), also on the Ostend seaplane sheds and on a train at Zarren (east of Dixmunde). Several tons of bombs were dropped.

All our machines returned safely.

JULY 7th, 5.55 p.m.—The enemy raiding squadron was chased by Royal Naval Air Service machines from this country and engaged 40 miles out to sea off the East Coast.

Two enemy machines were observed to crash into the sea. A third enemy machine was seen to fall in flames off the mouth of the Scheldt. All our machines returned safely.

[This does *not* agree with the German communiqué.—Ed.]

7.35 p.m.—Vice-Admiral, Dover, reports from Dunkirk :—

On information being received that enemy aircraft were attacking England, five flights were sent up to intercept them as they returned.

The raiding enemy aircraft were not seen, but three enemy seaplanes were encountered and destroyed, and one enemy aeroplane was driven down into the sea and another enemy aeroplane driven down.

The machines returned to replenish petrol and left again immediately. In the course of this patrol one enemy aeroplane was brought down in flames and another forced to land on the beach damaged near Ostend.

During the course of their operations none of the raiding enemy aeroplanes were encountered, and it is thought highly probable that they returned near the Scheldt and over Dutch territory.

[It is thought highly probable, then, that Vice-Admiral Bacon's machines did not go far enough to look for them.—Ed.]

JULY 8th.—A bombing flight of Royal Naval Air Service machines carried out a raid last evening (July 7th) on Ghistelles Aerodrome. Although heavily attacked by a hostile formation, bombs were successfully dropped on the objectives.

All our machines returned safely.

THE CASUALTY LIST.

Reported July 4th.

R.N.A.S.—DROWNED.—King, A. E., Air Mech., 1st Gde., F.4373.

Reported July 5th.

DIED OF WOUNDS.—Orfeur, Observer Sub-Lt. Charles B., R.N.

PREVIOUSLY REPORTED MISSING, NOW OFFICIALLY REPORTED KILLED.—Eppstein, Flt. Sub-Lt. Maurice W. W., R.N.

PREVIOUSLY REPORTED MISSING, NOW OFFICIALLY REPORTED PRISONER.—Walker, Flt. Sub-Lt. William R., R.N.

Reported July 9th.

KILLED.—Allan, Flt. Sub-Lt. H., R.N.

ACCIDENTALLY KILLED.—Flynn, Prob. Flight Officer H. J., R.N.

ACCIDENTALLY INJURED.—Clifford, Flt. Lt. R. M., R.N.

SLIGHTLY INJURED.—Blaxhill, Prob. Flt. Officer Alec E., R.N.

PERSONAL NOTICES.

DEATHS.

ALLAN.—Flt. Sub-Lt. Hugh Allan, R.N., who was killed on July 6th, was the only son of Lt.-Col. Sir H. Montagu Allan, C.V.O., and Lady Allan, Ravenscrag, Montreal, Canada. He was aged 20.

DUNCAN.—Flight Sub-Lieut. David Alan Duncan, R.N.A.S., was the only child of Lieut. G. H. F. Duncan, of 3, York House, Kensington, and Afton Lodge, Freshwater, Isle of Wight, and formerly of Valparaiso, Chile, and the late Mrs. G. H. F. Duncan. He was 21 years of age. Mr. Duncan, who was killed in an accident while flying on June 2nd, was born at Valparaiso, and was educated at the Charterhouse, Trinity College, Cambridge, and Sandhurst. He entered the cavalry in 1915, and subsequently joined the R.N.A.S.

FLYNN.—Probationary Flight Officer Harold John Flynn, R.N., was killed on July 5th while flying in East Kent. At a height of about 1,000 feet, his machine suddenly dipped and crashed to earth.

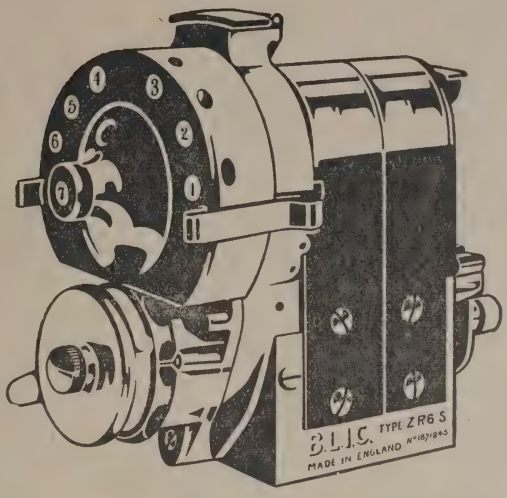
SIMS.—Flt. Sub-Lt. James Theodore Sims, R.N.A.S., who was killed on May 26th, aged 30, as the result of an accident while flying, was the elder son of the late James Sims and Mrs. Sims, of Redruth, Cornwall. He was educated at Plymouth College, and afterwards proceeded to West Africa, where he became the manager of a mine. He was at home on leave at the outbreak of war, and at once enlisted in the D.C.L.I., but obtaining a commission as sub-lieutenant, R.N.V.R., joined the Royal Naval Air Service in October, 1915, as an observer. After training he was sent to Dunkirk and distinguished himself by the photographs he took in the air under heavy shell fire, receiving the Croix de Guerre (with Palm) and being presented to the King by the Vice-Admiral in Command. Early this year he applied to be trained as a pilot and became probationary flight officer, being afterwards promoted flight sub-lieutenant.

MARRIAGE

ARNOLD — FREWER.—On July 2nd, at St. Patrick's Church, Hove, by the Rt. Rev. Bishop Goldsmith, D.D., Vicar of Hampstead, uncle of the bride, assisted by the Rev. Cyril C. Frewer, Rector of Brede, brother of the bride, Flight. Lieut. Harwood J. Arnold, D.S.O., R.N., younger son of the late Capt. O. J. H. Arnold, was married to Dorothy, daughter of the Rev. Canon G. E. Frewer, Prebendary of Fittleworth in Chichester Cathedral, and Mrs. Frewer, of Furze Hill, Hove, Sussex.

BIRTH.

BOUSFIELD.—On July 6th, 1917, at 180, Lincoln Road, Peterborough, the wife (née Gladys Toft) of Lieut. M. D. Bousfield, R.N.V.R., attd. R.N.A.S., of a daughter.



It has been announced that the star worn on the sleeve by graded officers of certain ranks in the Royal Naval Air Service is to be of the same size and design as the epaulette star worn by officers below the rank of rear-admiral, but in gold instead of in silver. On the shoulder-strap the star will be of a similar pattern, but of one-half the diameter. The two stars worn by squadron commanders of less than eight years' seniority as flight lieutenant, flight commander, and squadron commander will be worn in a vertical line on the sleeve and in a horizontal line on the shoulder-strap.

MILITARY.

G.H.Q. COMMUNIQUÉS.

JULY 3rd, 9.0 p.m.—Hostile aerial activity has shown marked increase during the past few days. Successful artillery work and bombing raids were carried out yesterday by our aeroplanes.

One German aeroplane was brought down in our lines by

The British-built High-grade Magneto!

B·L·I·C

THE BRITISH LIGHTING & IGNITION Co LTD

British capital and British labour are combined in the **"B.L.I.C."** to produce a Magneto as perfect as it is possible to make it. In every detail it is the true embodiment of scientific Magneto design and construction.

The **"B.L.I.C."** factory is British, the workmen are British—and more, both factory and workmen have behind them a long and unique experience in high-grade Magneto construction. The result is an ignition finer and more reliable than any yet produced—British or foreign.

THE BRITISH LIGHTING & IGNITION CO. LTD.

(Proprietors: VICKERS LIMITED),

204 TOTTENHAM COURT RD., LONDON, W.1.

gun fire, three more were brought down in air fighting, and two others driven down out of control.

One of our machines is missing.

July 4th, 9.25 p.m.—The enemy's aerial activity still continues. In air fighting yesterday three enemy machines were brought down, and five others were driven down out of control. Another hostile machine was shot down by our anti-aircraft guns.

One of our aeroplanes failed to return.

July 7th, 9.40 p.m.—There was much aerial fighting yesterday, chiefly on the front between Lens and Ypres. In this area the enemy's machines were encountered in large numbers, one formation being composed of as many as 30. Despite this pronounced activity on the enemy's part, we bombed his aerodromes during the day, causing damage, and carried out successful artillery work and photography.

The activity was continued by bombing during the night, in which the enemy showed more enterprise than he has hitherto done. He dropped 144 bombs on our side of the line, our bombing machines meanwhile dropping nearly three times that number on his side.

In the fighting during the day eight hostile machines were brought down and six others were driven down out of control.

Five of our machines are missing.

July 8th, 8.52 p.m.—Yesterday the enemy again displayed activity in the air and fighting was continued throughout the day. Hostile aircraft worked in large formations, which were frequently broken up by our pilots.

Our aviators carried out a number of successful raids, in the course of which the enemy's aerodromes, depots, and troops were attacked with bombs and machine-gun fire and considerable damage was done.

Six enemy machines were brought down in combat and 10 more were driven down out of control.

Eight of our machines are missing.

War Office Communiqué

July 6th.—The G.O.C., Macedonia reports:—

Our aeroplanes have bombed Drama, Porna, and Angista stations (all in the Struma Valley), the aerodrome at Drama, and camps and dumps at other places. Altogether during the month of June 19 tons of explosives were dropped by us and considerable damage was inflicted.

A hostile machine was brought down by our anti-aircraft guns near Akindzali (north-east of Lake Doiran), and was afterwards destroyed by artillery fire and aeroplanes' bombs.

Home Command Communiqués.

July 4th, 8.15 a.m.—Enemy aeroplanes appeared over the Essex coast about 7 a.m. Our anti-aircraft guns came into action.

Some bombs have been dropped, but no details as yet have been received.

12.15 p.m.—A squadron of some 12 to 14 enemy aeroplanes attacked Harwich from a north-easterly direction at about 7.5 a.m. this morning.

A number of bombs were dropped, and the latest reports state that eight persons were killed and 22 injured.

Only slight material damage was caused.

Fire was opened from the anti-aircraft defences and the enemy's formation was broken up, although low-lying clouds rendered visibility very bad. The raiders were also engaged by our own aircraft from a neighbouring station.

After dropping their bombs the enemy's squadron turned seawards without attempting to penetrate inland. The whole raid only occupied a few minutes.

July 7th, 11.45 a.m.—At about 9.30 a.m. this morning hostile aircraft in considerable numbers and probably in two parties appeared over the Isle of Thanet and the East Coast of Essex.

After dropping some bombs in Thanet the raiders proceeded in the direction of London, moving roughly parallel to the north bank of the Thames. They approached London from the north-east; then, changing their course, proceeded north and west and crossed London from north-west to south-west. Bombs were dropped in various places in the metropolitan area.

The number of raiding aeroplanes is at present uncertain, but was probably about 20. They were attacked by artillery and by large numbers of our own aeroplanes, but reports as to the results of the engagements as to damage and casualties have not yet been received.

6.30 p.m.—The total casualties reported by the police at present are as follows:—

Killed.

	Men.	Women.	Children.	Total.
Metropolitan area	27	4	3	34
Isle of Thanet	1	2	0	3
				37

Injured.

Metropolitan area	74	29	36	139
Isle of Thanet	0	1	1	2
				141

One of the enemy machines was brought down by the Royal Flying Corps and fell into the sea off the mouth of the Thames.

[This agrees with the German communiqué.—Ed.]

July 9th.—The latest police reports show the following revised list of the casualties which resulted from the air raid of July 7th:

Killed.

	Men.	Women.	Children.	Total.
Metropolitan Area	29	6	5	40
Isle of Thanet	1	2	—	3
				43

Injured.

	Men.	Women.	Children.	Total.
Metropolitan Area	98	44	52	194
Isle of Thanet	—	2	1	3
				197

The Casualty List.

Reported July 4th.

Kantel, Lt. F. W., Can. F.A., attd. R.F.C.

PERSONAL NOTICE.

DEATHS.

BOWMAN.—Lt. Leslie Spencer Bowman, King's Own (Royal Lancaster) Regt. and R.F.C. (killed in action on June 25th), was 20 years of age, and the only son of Dr. and Mrs. Bowman, of Ulverston. He had his lieutenancy in September, 1916, and was gazetted Flying Officer the same month.

CLEAVER.—Lt. Eric Arnold Cleaver, East Yorks, attached R.F.C., who was killed in action on July 3rd, was the fifth son of Mr. R. S. Cleaver, of Liverpool.

COLE-HAMILTON.—On July 2nd, at London Colney, Capt. C. W. E. Cole-Hamilton, Royal Scots and R.F.C., was killed while flying. He was the only son of the late Capt. W. A. T. Cole-Hamilton, R. Irish Fusiliers, and Mrs. Cole-Hamilton, Norfolk Hotel, S.W. It was stated at the inquest held at Napsbury War Hospital, near St. Albans, on July 3rd, that he was flying at a height of 5,000 feet and at a rate of 160 miles an hour, when the machine swerved to the right and got out of control. He was the officer commanding the aerodrome.

COWAN.—Capt. Sidney Edward Cowan, M.C., R.F.C. (previously reported missing, now reported killed), was awarded the Military Cross in May, 1916, when the "London Gazette" stated:—"He dived onto an enemy machine in the enemy's lines and drove it to the ground, where it was smashed, and then circled round and fired at the pilot and observer as they ran for shelter. Although forced to land through his engine stopping, he contrived to restart it and got back under heavy fire."

In the following October he was given a bar to his Cross "for conspicuous gallantry and skill. He has done fine work in aerial combats, and has shot down four enemy machines." And then last November he was awarded a second bar for "conspicuous gallantry in action. He fought a long contest with seven enemy machines, finally bringing one down in flames. He had displayed great skill and gallantry throughout."

Capt. Cowan entered the R.F.C. in August, 1915, and was gazetted flying officer in the following October. He was appointed flight commander in October last year, receiving at the same time the rank of temporary captain in the Army.

ELLIOTT.—An inquest was held on July 5th on the body of Sec. Lt. Geoffrey Lionel Elliott, R.F.C., who was found dead in the wreckage of an aeroplane in a field at Adel, near Leeds.

No one appears to have seen the machine descend, and the pilot, who was stationed at a Yorkshire camp many miles from the scene of the mishap, had been dead many hours when discovered.

ERLEBACH.—Sec. Lt. Arthur Woodland Erlebach, R.F.C., who was killed in action on July 5th, was the third son of Mr. and Mrs. H. A. Erlebach, Woodford House School, Birchington. He was aged 23.

EYTON-LLOYD.—Sec. Lt. John Wathen Eyton-Lloyd R.F.C., was killed in action on June 24th, 1917. He was 22 years of age.

FAIR.—Sec. Lt. James Gerald Fair, Yeomanry, attached R.F.C. (reported missing on March 19th, now officially reported killed), was the elder son of Mr. and Mrs. James S. Fair, The Berks, Lytham, Lancashire. He was 19 years of age and had his commission in the Yeomanry in October, 1915; he was gazetted flying officer in Jan., 1917.

FLETCHER.—The Coroner's jury who inquired on July 7th into the circumstances connected with the fatal flying accident near Birmingham to Sec. Lt. L. M. Fletcher, of Newcastle-on-Tyne, warmly commended the gallant conduct of First Air Mechanic Merritt, who accompanied Mr. Fletcher, and who is at present in hospital suffering from injuries. The accident to the aeroplane is attributed to a faulty turn at 60 ft. from the ground, which made the machine drop to earth. Immediately it fell it burst into flames, and Major Nicholls said he saw Merritt run along the side of the machine and try to get the pilot out. Merritt was uninjured then, and got his burns in facing the fierce flames in a gallant attempt to rescue Mr. Fletcher.

Witness wished to emphasise the heroism of the act. Another witness stated that the machine blazed like an inferno. The medical evidence showed that Mr. Fletcher's skull was fractured, and a verdict of accidental death was returned.

[As the pilot was killed and the passenger uninjured, this looks like another R.E.8. accident, especially as the machine caught fire.—Ed.]

FOLLIT.—Lt. Reginald William Follit, R.F.C., reported missing on April 28th last, is now stated by his observer (a prisoner) to have died as the result of an aerial engagement. He was the younger son of Mr. William Follit, of Avenue House, Clapham Park, S.W., and was 26 years of age. Educated at St. Lawrence College, Ramsgate, he joined the H.A.C. before the war, and after the outbreak of war was granted a commission in the R.F.A. When in France he transferred to the R.F.C., acting as observer. He obtained his pilot's certificate in England, and returned to the front on April 18th last.

GRAY.—Sergt.-Pilot Louis Gray, R.F.C., who was killed in France on active service on June 7th, was the son of Mr. and Mrs. Lewis Gray, 73, Union Grove, Aberdeen. Sergt. Gray joined the Army upon the outbreak of war, and had seen a good deal of service abroad. When quite a young man he had taken an active interest in aviation, had constructed many models and a full-sized glider which was successfully flown at Duthie Park seven years ago. Sergt. Gray was only twenty-four years old.

HAIST.—At an inquest held on July 7th respecting the death of Sec. Lt. Orville Dwight Haist, attached R.F.C., a Canadian aged 23, who was killed in a flying accident at an East Anglian aerodrome, it was stated that he was an experienced aviator, having passed for his "Wings." He attempted to rise from the ground before flying speed had been attained, with the result that he "stalled" the machine. One wing fell, and the machine nose-dived to the ground. The officer died in hospital. A verdict of death from misadventure was returned.

HAMER.—Lt. Harold Hamer, R.F.C., who was reported missing on June 6th, and is now officially reported killed in action, was the fourth son of the late Mrs. Hamer, of Alistre, St. Annes-on-Sea. He was in his 26th year.

HAWKER.—Major L. G. Hawker, V.C., D.S.O., R.E., attd. R.F.C., who was officially reported missing in November, 1916, is now officially reported killed. For many months the R.F.C. has assumed his death, an assumption based chiefly on the complete absence of news concerning him, but confirmed by the fact that shortly after his disappearance a German in a front line trench shouted across to our infantry that a Flying Corps officer, wearing a V.C. and a D.S.O., had died of wounds in hospital at Cambrai a few days before. As Major Hawker was at the time the only R.F.C. officer holding both orders, the message evidently referred to him.

Lanoe George Hawker was born in December, 1890, and so was not quite 26 years of age. He was the second son of the late Lt. Henry Colley Hawker, R.N., and a grandson of the late Peter William Lanoe Hawker, of Longparish House, Hants. He passed out of Woolwich into the Sappers in July, 1911. In 1914 he joined the R.F.C., and was at the Central Flying School when war broke out. There he distinguished himself by his skill

A. G. S.

AND OTHER

AIRCRAFT PARTS!

IMMEDIATE DELIVERY FROM STOCK OF MOST SIZES OF STANDARD FITTINGS.

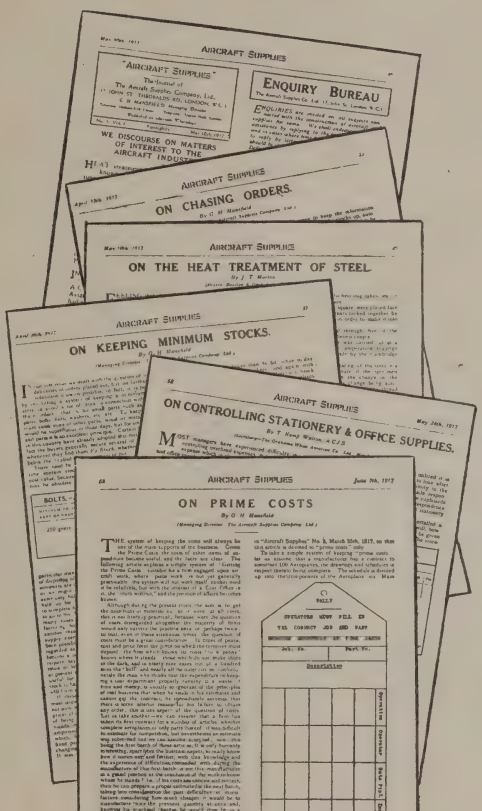
FOR NEXT WEEK'S ILLUSTRATED STOCK AND QUOTATION LIST

SEE

"AIRCRAFT SUPPLIES"

OUR FORTNIGHTLY HOUSE JOURNAL.

Vol. II. No. 4.



Ready Thurs. Next, July 19th.

PUBLISHED fortnightly, on alternate Thursday evenings, and issued FREE to the Air Services and to the Aircraft Industry (those in charge of Stores and other Works or Service Departments ONLY), on application to the Secretary.

CONTAINS a complete LIST OF STOCK of Aircraft Parts up to the time of going to press, CURRENT PRICES, details of NEW ITEMS, ENQUIRY BUREAU, and other A.S.C. announcements. A SHORT ARTICLE will also appear in each issue on a topic of interest to Aircraft Constructors.

STOCK LIST contains over 400 items.

STOCK ITEMS include Hex. Bolts—Hex. Nuts—Steel and Dural Washers—Spring Washers — Rafwir —Tie Rods—Strainers and Turnbuckles—Universal Joints —Bolts and Nuts (Metric)—Fittings (R.E. 8, B.E., &c.) —Pins (100 tons)—Pins (m/m) —Split Pins—Metal, Thread and Wood Screws—Thimbles —Wire Ferrules—Eyelets and Washers — Rivets — H.T. Steel Wire, etc., etc.

A few recent articles appearing in "Aircraft Supplies."

"The A.G.S. Book"

By BERNARD ISAAC.

CONTENTS.

CHARTS of A.G.S. Rafwires, Tie Rods and Joints, Nuts, Bolts, etc.—Metric Equivalent Charts—Numerical & Alphabetical List of A.G.S. Parts — Screw Thread Systems—A.G.S. Standard for Bolt Heads and Nuts — Photographs, Drawings and Dimensions of all important A.G.S. Parts—A.G.S. Fits and Limits, etc., etc., etc.

130 Pages. Over 230 Illustrations.

ISSUED FREE to **approved applications** from the Air Services and the Aircraft Industry (Commanding Officers, Officers in charge of Stores, Principals and Heads of Departments ONLY). Persons connected with the Aircraft Industry should make application through their firms. Applications from the Air Services should be made through the Commanding Officer. One copy is supplied **free** to each firm, and additional copies (cloth paper cover) may be obtained at 2 6 each, the whole of the proceeds, without deduction, being given to The Royal Aero Club Flying Services Fund.

APPLICATIONS must be made on the special forms which may be had from The Aircraft Supplies Co. Ltd., 166, PICCADILLY, LONDON, W.1.

SPECIAL AIRCRAFT AND ENGINE PARTS.

We can quote by return for Special Parts, on receipt of Blue Prints Quick Delivery!

Standard "A.G.S." and other parts are stocked for Immediate Delivery.

TOOLS.

We have now opened a Department for the supply of all kinds of Engineers' Tools for Aircraft Construction. For details of Stock see "Aircraft Supplies."

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The British Aircraft Industry.

BY CHARLES L. FREESTON.

XXIII.—THE FAIREY AVIATION CO., LTD.

It is not too much to say of Mr. C. R. Fairey, the founder of the Fairey Aviation Co., Ltd., that he has achieved a record. As is well known by now, the manufacturers of British aircraft may be divided broadly into two classes—those who were already established as designers before the war, and those who, though normally engaged in some other business, have taken up aeroplane production since August, 1914, and, generally speaking, have worked to Government or other standard designs under contract.

A Unique Achievement.

In every way remarkable, therefore, is the fact that the Fairey Aviation Co., founded in July, 1915, though it did not come into active existence until 1916, or 18 months after the war began, has nevertheless earned a name for originality of design, and, apart from its own considerable output, already enjoys the distinction of having its machines made under licence by four other firms. The achievement is unique, and none the less so because it has not been brought about by any big capitalist backing, but solely by the energy, skill, and enterprise of one man—namely, Mr. C. R. Fairey himself; and in the circumstances he may reasonably be described as one of the most brilliant young men of the aircraft industry

Mr. C. R. Fairey.

Mr. F. G. T. Dawson.

Natural Stability Models.

As will naturally be inferred, however, Mr. Fairey was no stranger to aircraft production when he established the firm which bears his own name, and as a matter of fact, his previous experience was extensive and gained in a good school. An electrical engineer by profession, and a first-class honours man at the City and Guilds, he also qualified in chemistry, and for a time was a lecturer on science at various polytechnics.

Aviation, however, had attracted his interest from the first, and he made a close study of the theories of inherent stability, and was a diligent experimenter with models. His first success in this direction was produced when he was twenty-two years of age, and though he had designed it in the interests of science alone, it was pointed out to him that the model would make a most excellent toy. Accordingly he disposed of his rights therein to Mr. A. W. Gamage, and a large number were made and sold, to the delectation and edification of the rising generation. Mr. Fairey also built a machine for the "Daily Mail" Model Competition, but it was smashed before the date of entry.

The Dunne Machine.

A long illness kept him out of aviation matters for some time, but after his recovery he got into touch, through the introduction of Major Baden-Powell, then President of the Aeronautical Society, with Lieut. (now Capt.) J. W. Dunne, the inventor of the famous inherently stable aeroplane, who had set up a workshop at Eastchurch.

The Blair Atholl Syndicate, it will be recollected by all who have followed the course of aviation development from the first, had been working out Mr. Dunne's ideas for years at Glen Tilt, in Scotland, under the fostering encouragement of the Marquess of Tullibardine, now Duke of Atholl and President of the Royal Aero Club. The venue was ultimately changed to Leysdown, however, and thence to Eastchurch. Mr. Fairey joined the Syndicate as manager and chief engineer.

A Problem in Stressing.

Four Dunne machines were built under Mr. Fairey's supervision at Eastchurch, the first being fitted with a 60-h.p. Green motor, while the 80-h.p. Gnôme was employed in the remaining three. The essentially individualistic design of the Dunne biplane, with its set-back staggered planes, gave Mr. Fairey a very pretty problem to tackle in the way of stressing, but he undoubtedly solved it with success.

The first two machines were regarded as experimental, while the second pair were constructed to the order of the War Office as the outcome of the extraordinary results attained by the earlier pair.

Convincing Tests.

The justification of Lieut. Dunne's ideas was complete, and a more naturally stable machine was never built. It is a fact that in the course of a single afternoon five persons flew the Dunne biplane, three of whom had never flown a machine of any type before.

A further interesting fact that may be adduced in this connection is that a one-armed man qualified for his pilot's certificate on the 60-h.p. Dunne—namely, Captain (now Colonel) A. B. Carden, R.E. This was the more remarkable from the fact that the Dunne machine has no foot control, notwithstanding which the ordinary hand controls were in no way altered for Capt. Carden's benefit.

A Cross-Channel Flight.

The crowning achievement, however, to the credit of the Dunne machine was its cross-Channel flight in 1913 with the 80-h.p. Gnôme. This was the second of the two experimental machines, and it was flown by a Frenchman, Captain Felix.

The general public, by the way, might have had much more expansive ideas as to the possibilities of flight if a few thousand Dunne biplanes could have been exhibited in various parts of the country in the hands of demonstrators who knew how to captivate the crowd; Captain Felix, on his part, used to stand up on one of the wings while he was doing a spiral *vol plané*, and his particular group of spectators, of course, were duly impressed.

That the Dunne machine has not ranked as a commercial proposition is due to a variety of causes, chief among which was the continued ill-health of the inventor himself. Of his genius, however, and the courage with which he embarked upon the construction of machines of such unconventional design, Mr. Fairey himself speaks with the greatest respect, and, though he doubts whether the Dunne would now hold its own for war purposes, he is convinced that if it had ever had the backing which the three-rudder types received, it would have occupied a much more prominent position in aviation history. It may be added, by the way, that certain machines are still made in America under licence to Dunne.

In 1913 Mr. Fairey went to Messrs. Short Brothers as chief engineer, at the period when they had begun the production of their well-known 160-h.p. seaplanes. He remained at the Eastchurch works for a considerable time, and then transferred his services to the Rochester establishment of the same firm.

A Bold Departure.

Meanwhile, however, he had decided to launch out for himself, and eventually founded the Fairey Aviation Co., Ltd., of which he is at once the chairman, managing director, and chief shareholder, his co-directors being Flight Lieut. F. G. T. Dawson and Mr. Charles Crisp.

The way in which operations were begun in February, 1916, almost savours of the romantic. A factory was acquired at Hayes, Middlesex, which had belonged to the well-known firm of motor-carriage builders, Messrs. van den Plas, and at the time of the transference the works were engaged upon motor lorries.

Of the three hundred Belgians employed, not one knew anything whatever about aeroplane construction or production in any particular, nor was there a single skilled draughtsman on the premises, whereas now there is a technical staff of thirty people. Mr. Fairey accordingly had to train his own draughtsmen and foremen, install a new plant, and, in addition to his triple commercial responsibilities, as above defined, was also his own works' manager, and, above all, his own designer.

Unparalleled Progress.

Nevertheless, the progress of the firm has been one of unparalleled and all but meteoric rapidity. As an organiser alone Mr. Fairey's efforts might have been accounted more than remarkable, and the more especially as his partner, Flight Lieut. Dawson, was away in the Dardanelles, but they are even outshadowed by the part Mr. Fairey has played in the realm of design.

From the outset he addressed himself to the task of developing big seaplanes on new lines, and chiefly in respect of the problem of a variable lift, which he has solved with marked success.

Successful Designs.

To keep the works going while he was completing his designs Mr. Fairey accepted a contract for the construction of a large number of land machines of a very well-known type.

The moment, however, his own ideas had been reduced to practicable shape, he set to work to build variable lift seaplanes, and of these he has produced no fewer than four separate models. Their success has been emphatic, and they are not only being turned out for the Admiralty by the Fairey Aviation Co. itself, but also, as already stated, are being manufactured under licence.

Thus we see that in the space of little over a year Mr. Fairey has not only founded and made a commercial success of a new concern, but has also placed himself in the position of being able to decline all contract work on established designs, and to take the lead with a new line of original types. It is almost needless to remark that a great deal more would have been heard about the Fairey machines as such but for the fact that they have been evolved since the war began.

Constant Expansions.

The works at Hayes have been very considerably expanded since they were taken over from the van den Plas Company, and further enlargements are still in progress. They afford evidence on every hand, as a tour of the premises discloses, of a sound knowledge of everything that is required in the way of organisation and plant for the production of machines of the best and latest types, and, taken altogether, may be regarded as a unique development.

Mr. Fairey has just been joined, by the way, by Mr. Charles, late of the Sunbeam and Daimler companies, who will henceforth act as general manager at Hayes. It must also be mentioned that, in addition to the premises at Hayes, there are also an erecting shop and experimental station at Hamble, under the charge of the second director of the Fairey Aviation Co., Mr. Dawson, who has been invalided out of the R.N.A.S. Incidentally one must note that Mr. Dawson is himself quite a pioneer of aviation, having taken part with Mr. (now Wing Commander) Ogilvie, Mr. (now Flight Commander) Maurice Wright, and Mr. (now Squad. Comm. and D.S.C.) Vincent Nicholl, in gliding experiments at Eastchurch somewhere about 1911. On the outbreak of war he left Cambridge, along with Messrs. Wright and Nicholl, and joined the R.N.A.S., learning to fly at Eastbourne under Mr. (now Squadron Commander) Bernard Fowler, and soon became a first-class pilot.

He saw much service in the Eastern Mediterranean, and was invalided out of the Service owing to serious heart trouble, which prevented him from flying to any great height. He still flies as skilfully as ever, but has to exercise considerable restraint over his natural inclination to do those things with his machine of which he is capable. As a practical pilot of long experience he is in every way qualified, of course, to supervise the testing of the Fairey seaplanes and the experimental work generally which is carried on at the southern station.

AND YET ANOTHER.

It is the custom of minor public prints to refer to their rival contemporaries as "rags." The term is usually mutual, although the proprietors do not append it to their own property. It is therefore the more entertaining to inspect the first numbers of a self-confessed "rag." The Aircraft Manufacturing Co., Ltd., has long been noted for its enterprise, and one therefore has expected the production of a house magazine for some time. The excellence of the first two issues seems to explain that the moving spirits waited till it was possible to start under the most auspicious conditions, and certainly the right note has been struck at the first attempt.

The "Aircraft Rag" is the magazine of the employees of the firm, and as it only comes out once a month, there is time for work of a high order to be produced.

The June issue includes an admittedly humorous section called "Bottles and Rags," by the "Ragpicker," which contains a fund of amusing quips, relevant and irrelevant to aircraft.

"Gladys" gives some advice to her own sex only upon the art of getting joy-rides, the soundness of which is queried by the statement that the illustrations are by the author, who signs them as Alan Hill-Reid!

The illustrations are of a very high order, and include a full-page picture of the King and Queen inspecting the Aircraft Manufacturing Co.'s works, by Mr. J. K. Baughan; humorous pictures by Mr. G. Stredwick, "The Junior Clerk," Mr. Alan Hill-Reid, and others, and a very fine picture of the woodcut type by one signed "P."

The text includes "The History of the Bolt Inspection Department," an interview with the Chief Sprinkler, an "Ode to a Turnbuckle," a serial article called "Tee-Square Bill," and a great deal more, all of which combines to make a very good pennyworth.

GERMAN INDUSTRIAL NOTES.

The A.E.G. Aircraft Works announce the death of their chief pilot, Theodor Schauenburg, who was one of the oldest German pilots. Another early aviator, former Grade pilot, now Sub-Officer Carl Abelmann, is missing since a patrol flight

* * *

The "Automobol and Aviatik Co., Ltd.," has formed branch works at the Bork aerodrome by Berlin, formerly owned by the Grade Aeroplane Company.

* * *

The "Bavarian Aircraft Works," which were formed in 1916 with a capital of £500,000 by the partaking of the Augsburg-Nürnberg Submarine Engine Works, has earned in the first business year net profits amounting to £67,772, of which 20 per cent. were paid as dividends, and £55,000 set aside for war excess profit tax. The advance part payment by the army authorities for aeroplanes to be delivered later amounted to £75,000.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Through Enemy Eyes.

(A LESSON FOR THE BRITISH AUTHORITIES).

BY "THE AEROPLANE'S" DANISH CORRESPONDENT.

Following are some extracts of the reports and reviews in the German aeronautical Press, of the German Aeronautical War Trophy Exhibition. The praise may be taken for genuine, as it comes from the enemy. In "Motor," Berlin, Engineer John Rosendaal writes :—

"The huge development of the whole aviation in this world's war, together with the associated refinement of the detail work of all planes and instruments is last, not least, the result of the continuous, though involuntary, exchange of thoughts by means of war trophies, as regards the technical aids available for the extraordinary fighting taking place. This exchange develops a mutual fructification of ideas, which should in other times likely not be possible to such a degree.

"From the moment that the product leaves the home works to be engaged in the fight against the enemy on some point of the front its eventual loss and the unveiling of its design must be reckoned with. This invariable fact forces all parties uninterruptedly to strive at the perfection of their weapons not to experience the danger of being beaten with their own weapons.

"This general state of conditions has, of course, foremost validity in such a young weapon as the aeroplane, so, quite apart from other motives, it is a thought highly to be welcomed that the Commanders of the Air Services have offered the designers and experts a chance of getting an idea of the standing and development of aviation by the enemy, through the concentration of the booty in the one place of the Delka (the initials standing for: Deutsche Luft Kriegsbrute Ausstellung—or German Aeronautical War Trophy Exhibition). And, to say it at once, if you distinguish between men and machines, the show is more than remunerative."

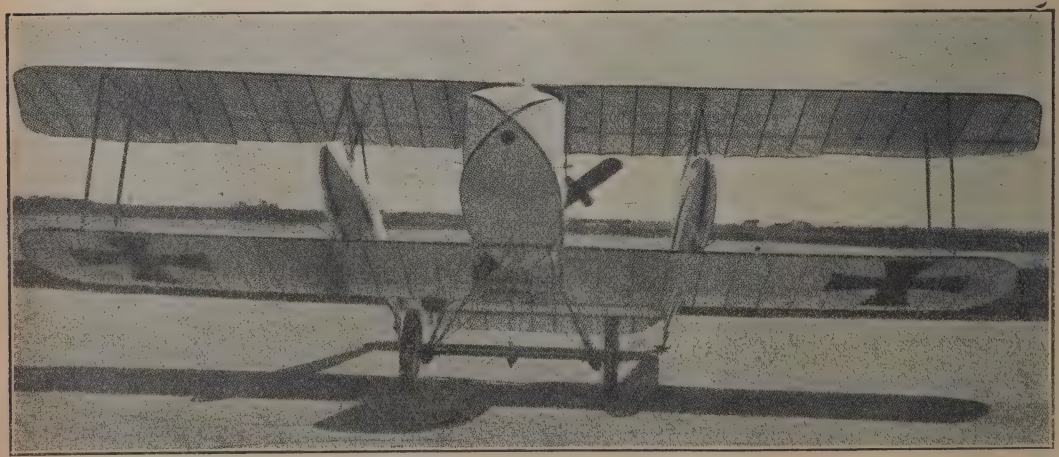
Engineer Rosendaal deserves the praise of possessing rare objectiveness for a German. Also the well-known German aeronautical engineer, Mr. Roland Eisenlohr, writes in "Deutsche Luftfahrer Zeitung" (German Airmen's Paper), and "Der Motorwagen" (The Motor Car), as follows :—

"No one can doubt that we are far superior in German aviation with design—with the one exception of the Nieuport biplane to be considered a special brilliant French achievement—in quality of the construction, in scientific shape of the planes, etc.

"Another question is that of working out the single parts as to quantity manufacture, which rules undisputedly more among the enemy. An instance being the employment of double wires, not as a factor of safety, as the one would seldom stand the strain when the other has been shot through, but for simplifying the erection, as different sizes and turnbuckles are thus done away with. When one wire suffices no more for the average strain they employ two, though they are combined really too strong. But then they have in the whole aeroplane only one turnbuckle model, one size of stamping sheet, holes and pins. The stampings themselves can be manufactured much quicker in quantities by better utilisation of machine work. However, quality is regarded more by us than quantity, which is the reason that such efforts are very rare in Germany, and rendered almost impossible by the specifications.

[British aeronautical engineers who have been crying for years for simplification of standards by means of reducing the foolishly large number of different sizes of everything in our Government designed machines will weep with joy over this remark. But, possibly, Herr Eisenlohr's remarks apply to the Nieuport only, and not to Allies' machines in general, including B.Es, R.Es, and F.Es.—Ed.].

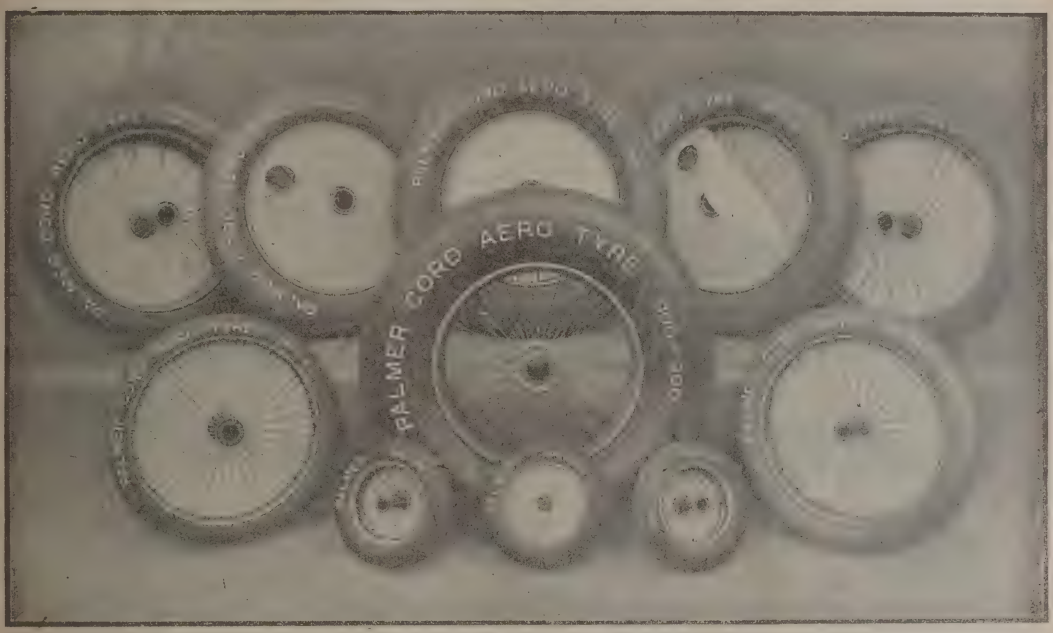
"The wooden work is another matter. In the otherwise very scientific construction of the Sopwith biplanes the longerons of the body are cut out for their whole length without any regards to the stampings, which are, on the other hand, made so that they do not perforate or weaken the longeron. What is not the saving in work and weight, too, by such a procedure? Perhaps it would be better for us to enter upon this idea, too, as workmen are not too plentiful in our aircraft industry.



"No doubt the most interesting aeroplane of the whole exhibition is the two-seated Sopwith biplane, representing the summit in the English aircraft trade, though it cannot show the excellent workmanship of German products.

[This will please Mr. Sigrist.—Ed.]

"It was highly to be appreciated that the planes of the Sopwith were shown uncovered, as the object of the exhibition was not only to keep the interest of the public alive in the Air Services, but to give the designers impulses by studying the products of the enemy, to which end the Sopwith offered many inspirations. The body is as genuine as the work of the planes, in the effort to do away with all unnecessary weights. (See the remarks on carving, above.)



"Even in this otherwise well-designed biplane the wires for the elevator and rudder are exterior. The Sopwith biplane is especially extraordinary for two peculiarities of design; first, the ailerons on the lower plane, which can be pulled up and likely serve to reduce the landing speed, as well as to regulate the speed in flight. Second, as the biplane is likely used also for bombing purposes without the observer, the stabilising plane (or tail plane) in front of the elevator can be moved by the pilot. While the front bearing point is placed in a hinge, the back point, through which the vertical steel tube passes, also carrying the vertical fin, can by means of a worm be screwed up and down, a construction belonging to the best produced to this effect. It would take us too long to deal in detail with the many other interesting points.

"Of the three hydro-aeroplanes exhibited one is a seaplane, and moreover specified as a Sopwith fighting single-seater, the machine-gun of which was not mounted, it is to be regretted. It is the best British seaplane type among the single-seaters, and shows a very good construction, like the before-described Sopwith biplane. The sturdy body with the pleasant cowling of the rotary engine lends the aeroplane a good appearance. Not to have to demount the floats for railway transport the back part of the body is made detachable, whereby turnbuckles are very simply used as a fixing, as shown in an accompanying sketch. The front stamping is not even carried out as an eye, but only shaped like a hook. But then the fixing lying pretty far backwards has not to stand very high strains. Yet such a device should be quite untolerated in Germany."

The Small High-Speed A.G.O. Pusher, commonly known as "Two-tails." The two fuselage-like tail-booms are evidently a praiseworthy attempt to do away with the clumsy and weak tube booms and wires of the ordinary pusher type and thus reduce head-resistance and increase strength at the same time.

THE PALMER TYRE LIMITED

Contractors to the Admiralty and to the War Office,

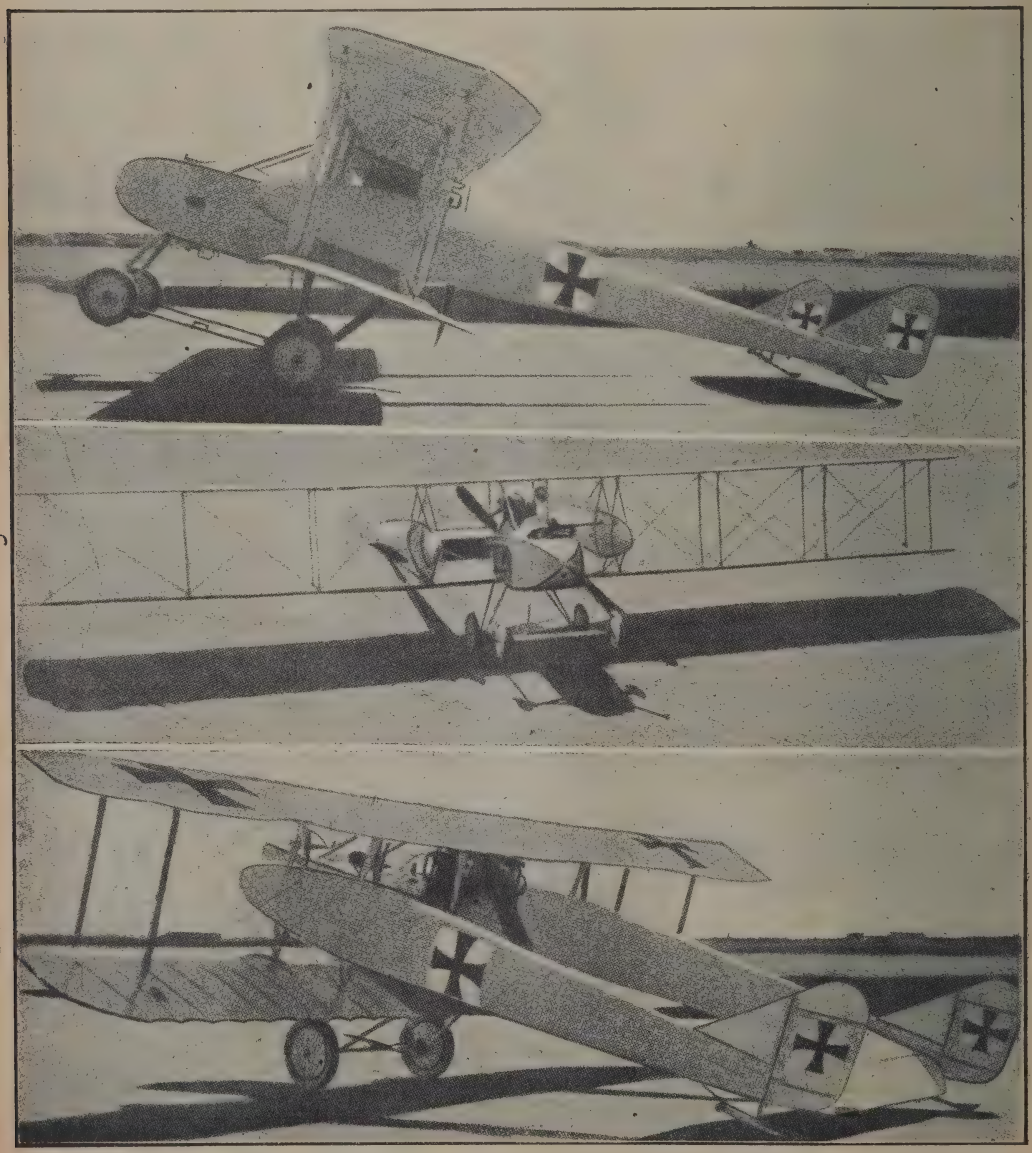
119, 121, 123, SHAFTESBURY AVENUE, LONDON, W.C.2.

Telegrams: "TYRICORD, WESTCENT, LONDON." Telephone: GERRARD 1214 (Five lines).

PARIS: 24, Boulevard de Villiers, Levallois-Perret.

Mr. Rosendaal remarks on it: "A daring but practical connection of the two body parts by means of four turnbuckles."

Of the "Avro," Mr. Rosendaal writes: "A biplane with the general known tractor body, and one of the owners of the firm, Mr. A. V. Roe, was, indeed, one of the pioneers of the now usual tractor biplane with the motor and propeller in front, as he built already in 1908 a three-plane with tractor body, on which he carried out successful flights.



"The here-exhibited two-seated biplane astounds by its slender shape and pleasant lines, but must else for the rest, concerning measures and distribution of the weight be considered as antiquated since a long time. Roe belongs to the designers who recognised at an early date the high value of streamlines and good plane shapes, and acted thereupon in practice."

Continuing, he writes: "Behind the Nieuport the single-seated Martinsyde is to be seen, being, too, very good work. A part of the linen cover of the lower plane is taken away, affording a view into the interior design. One notices very sound work. All wooden parts are enamelled (varnished) as protection against the atmospheric influences, a practice that has disappeared much during later years, yet is fully justified. One would prefer to see square longerons instead of the 'I' ones."

Engineer Eisenlohr continues: "It was intended to exhibit the Handley Page giant biplane, but perhaps it is well that this aeroplane was not to be seen, as it looks too impressive, and, perhaps, easy had drawn an unfavourable opinion of the German aeroplanes from the laity, who do not know the German opposites. It would not satisfy German claims in design and performance, though the total arrangement offers, no doubt, the expert much of interest by close study.

"It is a pity that a chance could not be given of comparing these exhibited hostile aeroplanes with the German equals; for first, then, the difference between our and the enemy's design and construction should become evident. For it is proved facts that our enemies cannot approach our workmanship in quality, but be it confessed that their aeroplanes often are superior to ours, partly from lacking factor of safety, and partly from insufficient construction, exposing the passengers to danger of life.

"For the Frenchman and Englishman attains only the lightness of his machine through savings in weight in some of the

Above and in the middle, side and front views of the big A.G.O. Pusher, and below, three-quarter rear view of the little one

Head Office and Works - - - WOLVERHAMPTON

most dangerous places, and thereto the solid German industry cannot be induced. The opinion of the twin-engined Caudron biplane is that its construction should have been condemned years ago, but beside showing how not to do it, it lends itself to the question whether is not another way beyond the one ordered in Germany for construction to get active serviceable aeroplane types. For, undoubtedly, our enemies do not, by all means, build light twin-engined aeroplanes without some reason."

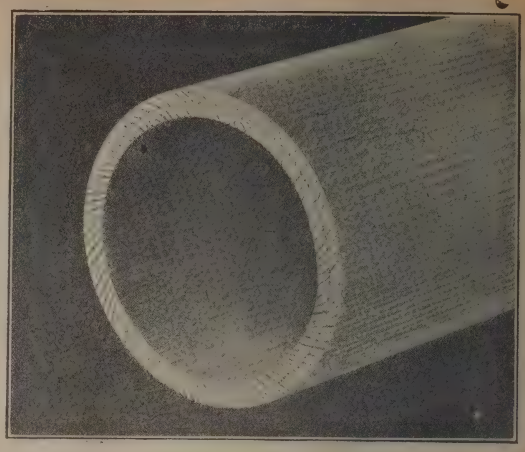
German papers pay the new Spad scout especial attention and exceptional praise; thus "Flugsport" has a special blue-paper cross-reference to its description of the Spad biplane, and the "German Airmen's Paper" ("Deutsche Luftfahrer Zeitschrift") writes in extract to this effect:—

"In a way worthy of being taken for a model the motor is enclosed completely, disappearing in the exemplary formed body. So one has to pronounce and recognise this new construction in the field of single-seater scouts as very excellently designed, throwing all former results of our enemies far in the shadow, especially owing to the exceptional large attention to rigid solidness of the whole structure. The German aircraft industry shall learn much from this aeroplane type and become incited to many new ideas in design. Just as our enemies equipped last year in the big Spring offensive an exceptional number of their Air Service with the Nieuport biplane, so they did this year with the Spad scout. Our aircraft industry have too worked during the winter on new types that shall, be it hoped, get an equal recognition to that which we cannot refuse this aeroplane."

The capture, or more correctly, the errorial acquirement of a Handley Page giant biplane near Laon was given a widespread publication in the German Press, but apparently with somewhat unexpected effect. For it has evidently been a general impression in uninitiated circles of Germany, that in this field of aerial activities with big aircraft she had been surpassed.

As experts warn expressly not to get that belief, the suppressing from national interests of doings in this line declaring alone the lack of information concerning German twin-engined battleplanes, careful observers will explain the permission of German aero papers to illustrate the Ago, A.E.G., and Gotha double-engined aircraft also as an effort to counteract any such impression, and now, again, the new German aviation weekly paper "Luftwaffe" (The Air Force), being the catalogue of the German Aviation War Trophy Exhibition prints the four illustrations of Ago battleplanes, rendered here.

They represent two various models, varying chiefly in wing spread. Both biplanes are twin-bodied pushers with Farman type nacelles. The smaller one does apparently not exceed the wing span of a normal-sized tractor biplane, and has but one set of struts to each side beyond the two oval ones, carrying the bodies, the chief object of which seem to yield that pusher type a better longitudinal stability than afford the general Farman strut tails, for they carry no engines or passengers, and are apparently made of two parts, with a black lining as visible. The struts are combined by single wire crosses, the nacelle is supported by two inclined struts from the leading edge of the upper plane to the middle of the nacelle, between the two seats, and the tail skids end with the metal scoops, first applied to the middle skid of the Nieuport monoplane.



The second Ago twin-bodied battleplane is identical in design and construction, and apparently in the size of the various parts even, but for the larger wings, apparently doubled in span, with three sets of struts to each side, and the four-wheel landing chassis of Voisin type.

[One imagines that the real reason for the two so-called "bodies" is the theory that two good stout streamlined built-up tubes will be less vulnerable, and will offer less head-resistance than four thin tailbooms with the usual network of wires. The idea seems quite sound, and, properly carried out, it might produce the much-desired high-speed "pusher" biplane, especially in large sizes, where one could fit an enormous engine.—Ed.]

CONCERNING HOLLOW SPARS.

Some time ago reference was made in these columns to the McGruer Hollow Spar, which has been proved to give enormous strength for its weight. At that time it was not considered advisable to illustrate the method of the construction of the spar, but as it has now become commonly known and has been illustrated in various quarters, there can be no harm in drawing attention to the general idea of the construction, without giving away details. The accompanying picture shows the idea roughly.

The wood to be made into a spar is cut as a flat sheet with the grain of the timber vertical. It is then bent over by a special process, the secret of which belongs to the firm, and is formed into a tube, which tube may be either a circular section as shown, or may be multi-sided, oval, or streamlined. Outside the first tube a second tube is formed, which is cemented in a special manner to the inner tube, and thus one arrives at what is practically a 2-ply tube, which, owing to the method of construction and the material employed in jointing, is astonishingly

The General Idea of a McGruer Hollow Spar.

strong for its weight, as well as retaining the elastic properties of the wood itself.

It has taken a very considerable time for some people in the Services and the Aircraft Industry to recognise the merits of this particular method of construction, but one now hears that it is being vigorously taken up by many firms, not only in the Aircraft Industry, but in a number of other trades where wood spars are largely used.

One of the chief advantages of the McGruer bentwood hollow spar system is that not only does it give extraordinary strength for weight, but it actually results in an enormous saving of timber, because it is possible in this way to make a hollow spar out of thin sheets of timber instead of by hollowing out large chunks, thus wasting all the material removed in the hollowing.

The address of the McGruer Bentwood Hollow Spar Company is Commercial Wharf, Lambeth, S.E., and the firm will be very pleased to negotiate with any aircraft manufacturer who would like to investigate the possibilities of the system for any special section of strut, spar, or boom in his own designs.

FOR METAL PARTS.

Some time ago it was noted that Mr. Wilson, who has had considerable experience in the cycle, motor car, and aircraft industries, had started as a manufacturer of aircraft parts at Kingston under the title of the Swift Aviation Company, and as soon as it was in working order the firm found itself well supplied with work, and quickly began to earn a good reputation.

Not long afterwards, Mr. Wilson was joined by Mr. E. C. Gillett, himself an engineer of very considerable experience. With Mr. Gillett's able assistance the output has increased steadily, and the firm is now in a position to supply parts for any type of aircraft at short notice, for either Mr. Wilson or Mr. Gillett is almost continuously at the works himself, so that inquiries are dealt with promptly, owing to the principals of the firm being on the spot and being practical men.

PREMISES WANTED.

Barimar Ltd., scientific welding engineers and sheet metal workers, 10, Poland Street, Oxford Street, London. W., would be glad if any of our readers who are property owners, lessees, or agents, who have to let in Central London factory premises, with offices, warehouses, with yard, facilities for extension, and back or flank entrances, would communicate with them.

AN OPPORTUNITY.

A British engineer in London with capital and a live business organisation writes to say that in view of the extreme need for the rapid development of our Aircraft Service he is prepared to co-operate financially and actively with any good firm and accept a seat on the board of management. If any readers know of the existence of such an opening and will write to the Editor of this journal, business may result.

THE NEW BUYERS' GUIDE.

In response to numerous inquiries, one is able to state with emphasis that there is no truth in the rumour that the proprietors of The Aeroplane intend to apply for a positive Patent for the protection of this piece of platitudinous profundity from the piratical propensities of peculative Prussians, nor is it intended to invoke the wrath of the Paper Commission by "featuring" this admittedly useful institution in a weekly twenty-page supplement with deckle edges.

At the same time, the advertisement manager will welcome any suggestions as to how the comprehensiveness and general usefulness of the Buyers' Guide may be enhanced.

GHW.

The Production of Aeroplanes and their Components

(Fifth Instalment.)

BY STEPNEY BLAKENEY.

The Top Half.

Having now completed the bottom portion of the rear end of the fuselage, it is necessary to commence on the top portion, which, being similar to the bottom, can be built in a similar manner, with the difference that as the lower portion is not parallel to the top longeron, the distances of the struts apart will be slightly longer in the low portion, and it will for this reason be necessary to refer to the plan and see if the existing jig can be utilised.

Otherwise a new jig will have to be prepared on similar lines.

Assuming that the top and bottom portions of the rear end of the fuselage have been built, the next question to consider is, how is the fuselage to be completed, with its side struts to put in, and all the swaged wires to be fixed and adjusted?

Erecting the Fuselage.

To enable this to be done easily it will be advisable to consider making a simple jig, which will simplify erection tremendously, and enable the work to proceed rapidly, and tend to prevent mistakes. For this purpose, make six portable columns standing on feet, with adjustable top and bottom, cross rails and longitudinals (see Figs. 10 and 10a). The use of this jig will enable work to be put in hand quickly, and when completed taken down. Reference to Fig. 10 will give an idea of its construction.

Having completed the jig, the first thing to do will be to take the top rear portion of the fuselage, and attach it to the top portion of the jig on the underside of the cross bearers as shown, and then put the bottom portion of the fuselage on the top of the lower cross bearers as shown. After which, level up the top portion of the jig with a spirit level, and then adjust the lower portion to the inclination given by the measurements of the lengths of the struts between the longerons.

After this is done and carefully checked, the struts with their fittings on them may be put in their respective positions and bolted to the longerons and riveted up, and the ash skid post fixed. Then the only work remaining to be done is to put in the tie rods and fork ends with lock nuts, and to adjust the tension on them.

Then the lower longitudinal and cross bearers can be lowered slightly, and any adjustment necessary in the tie rods will be at once seen while the rear portion of the fuselage is in suspension and the "line of flight" of the machine is in a true and horizontal position. In this manner the necessary truing up of the fuselage can be done.

The Front Section.

The front portions of the fuselage can now be constructed. They will have to be constructed in a jig similar in design to the rear portions, only these parts will be left- and right-handed, instead of top and bottom. Extreme accuracy will be necessary in all measurements, especially in the distance between the top longerons and the bottom ash spars, otherwise it will be impossible to join these front portions, when made, to the rear portions, already finished, as the joint of the longerons is a plain butt-joint, with cover-plates of steel top and bottom, like fish-plates.

A jig will have to be made for the left hand and also the right hand, as the outsides are covered with three-ply wood, on one side only, namely, the outside, being attached to the longeron,

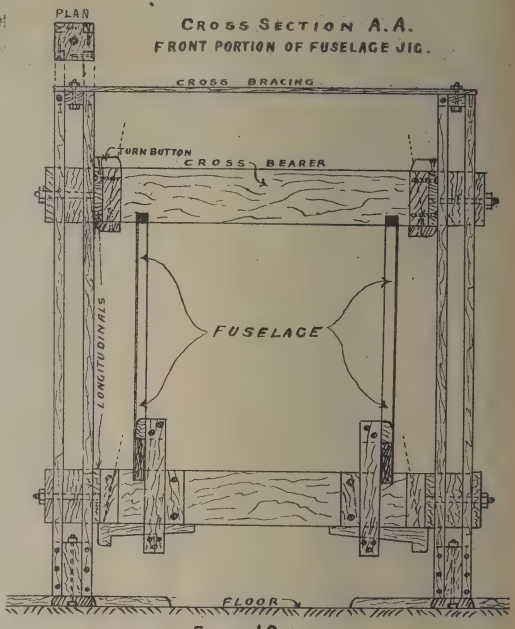

FIG. 10a.

engine bearers, cross bracing (which is of wood), and ash spars with small screws.

Assuming that the front portions of the fuselage are completed, and passed by the A.I.D. Inspector, they will be taken to the erecting shop. To put them in the jig, the bottom stop and the longitudinal sides of the jig may have to be lowered slightly to enable them to slide into the slots made to hold them in the cross bearers. After they are in position, the tapered wedges will be driven home. This will clamp them firmly to the bottom cross bearers (see Fig. 10a), other adjustments being made that are necessary.

Checking for Alignment.

These having been completed, it will be necessary to try the whole jig with a spirit level, and fine 22 gauge steel wire stretched along the top and bottom centres, between the longerons, from end to end. Test them both, for vertical alignment, about every 2 ft., by means of a plumb-bob line, from the top wire to the bottom wire, taking extreme care to see that the plumb line from the top wire touches the bottom wire at each point tried in the same side. This should be done in the presence of the foreman erector, unless two skilled mechanics are available.

SECTIONAL ELEVATION OF JIG AND FUSELAGE.

This check will be of the utmost value, as it will immediately show up any twist or inaccuracy in the fuselage, which must at once be rectified, either by alteration of the jig, or alteration of the tie rods, or both, as may be necessary. If the greatest possible attention is not paid to this work, the fuselage will be all of a twist, which will not do, as it will seriously affect the machine when in flight, as the tail plane will be out of the horizontal with the wings, and the fin and rudder will not be vertical, therefore the importance cannot be overestimated.

Bolting Up.

Having checked the fuselage, both rear and front portions, and found them correct, and the joints of the top and bottom longerons in perfect alignment, without any artificial means being used, the fittings for the joints may be placed in position, and the bolt holes carefully marked off. The holes can then be drilled by means of an electric drill and jig, the greatest care and accuracy being required, to ensure the holes being drilled central and vertically through the longerons.

These being done, the fittings can be bolted in position, thus permanently tying the front and rear portions together.

The Next Step.

If the works' manager, or the foreman of the erecting shop, approves of the job as so far completed, the transoms, or cross ties, the seat bearers and the tank bearers, must now be fitted in. But if the fuselage is allowed to remain in the jig whilst this is done, it will delay progress with fuselage No. 2, and as this is not permissible, the fuselage must be very carefully removed from the jig and put on trestles which have been previously levelled up.

In putting in the tank bearers and seat bearers, etc., the tops and bottoms of the front end of the fuselage must be accurately clamped together, before removal from jig, with a distance piece in between, of the correct size to maintain the theoretical width, otherwise the tank and seat bearers will be incorrect.

These having been fitted, the two compression struts, onto which the wing spars butt, must now be put in position, not forgetting when doing so that two fittings, left and right hand, have to be fitted onto the bottom ash spars at the same time, and the bolt holes very carefully marked off, and drilled. After which, the fittings and struts may be put into position and bolted and riveted up.

The flooring can now be fitted in. This will consist of ⅜-in spruce, suitably stiffened with longitudinal bearers, the flooring being put in across the machine and screwed down with brass screws.

The Landing Carriage.

Having got so far, it will be as well to consider the landing chassis struts. These, owing to their being splayed outwards, will have to have their ends cut to an angle, where they bed into the strut-fittings attached to the ash front spar. To carry out this work correctly a proper start must be made and the work carried out in a systematic and workmanlike manner.

The first thing to do is to find out the distance from the top longeron to the floor of the shop and allow an extra half-inch for clearance when the wheels are on the axle. Having found the distance from the plan, which we will assume to be about 6 ft. 6 in., place the fuselage on trestles and packing. This height can be measured by placing a straightedge on the top longeron and measuring down to the floor, taking care before doing so to see that the fuselage is level longitudinally and transversely at each end and in the middle.

Having done this, procure a straightedge about 7 to 8 ft. long, and lay it across the top of the fuselage on its edge, over the centre of the front chassis strut. After having marked the centre of length on it with a fine knife cut, and the extent of splay each side, which for our purpose we will call 6 ft. 9 in., which will be 3 ft. 4½ in. each side of the centre mark, attach a blumb-bob to each of these points. Allow the plumb-bob to hang down, and mark the point indicated by the point of the plumb-bob on a nicely planed board which has been screwed to a couple of short trestles or supports, carefully made to coincide with the theoretical bottom of the wooden strut, and levelled up with a spirit level.

Having done this, the erectors will have their top and bottom points to which to fit the strut, and this method will prevent any inaccuracy, as they can utilise the fixed bases in bevelling the strut ends time after time, thus enabling accurate results to be rapidly obtained. Having cut and fitted the top end of the front chassis struts to the top fittings, the struts can be taken out and the bottom junction fitting fitted, bevelled, and bolted onto the bottom of the front strut.

Rear Chassis Struts.

The next thing to do will be to fit the rear chassis struts, which are slightly more difficult, as they splay outwards and rake backwards and upwards. Thus there are two angles to contend with, and for this purpose the angle between the two struts should be carefully obtained from the drawing office if it is not clearly marked on the plan.

The angle should be set out on a setting-out table, and a few stops screwed onto the table, to contain the chassis struts in their theoretical position whilst the rear strut is being shaped and fitted to the fitting. For this purpose the front strut should be clamped down on bearers, which are a sufficient height off the setting-out table to clear any projection of the junction fitting. This will enable the rear strut to be fitted up in an identical angle to the fitting which it will be in when permanently fitted and bolted to the fuselage.

Having bevelled and fitted the rear strut, and having had it checked by the works' inspector and the A.I.D., and stamped, the final assembly can be commenced. After the position of each chassis strut and the fittings on the bottom have been checked, the bolt holes can be drilled in position without further taking down. The bolts can be put in and tightened up and riveted over, thus finishing the fitting up of the chassis, with the exception of putting in the axle and attaching the wheels.

The next thing to do will be to shape up the ash skid post, and fit the skid lever hinge fitting on, which, being more or less similar to bedding in the chassis strut fittings, will require no special remarks. This also applies to the four centre plane struts.

Streamline Fairing.

The streamline fairing on the top of the fuselage at the rear end, aft of the pilot's seat, can now be put in hand. This will consist of 3/16-in. three-ply semi-circular uprights, the highest one being 9 in. high, and the same width as the fuselage, notched out on the radius about 2-in. pitch with ⅜ in. by ⅛ in. deep notches to take the ⅜ in. by ⅛ in. spruce stringers which run longitudinally with the fuselage to support the fabric. There will be about 10 of these stringers and one extra heavy section on each side for attaching the whole of the fairing to the fuselage. The height of the semi-circular 3-ply uprights gradually diminishes towards the rear, until the tail plane leading edge is reached, where it dies out. The whole of the spruce stringers forming the skeleton framework of the fairing are covered with fabric, which will be doped when completed, and varnished.

The covering on the top of the fuselage in front of the pilot's seat will consist of 20-gauge aluminium sheet strengthened with ash bends underneath, attached to the fuselage and also to the aluminium sheet with brass screws. This will be dealt with later on when dealing with the manufacture of metal fittings and work.

(To be continued.)

CORRESPONDENCE ON AEROPLANE PRODUCTION.

The following letters referring to Mr. Blakeney's articles have been received. Mr. Blakeney's replies are appended:—

I.

Sir,—Many thanks for Mr. Blakeney's admirable article in The Aeroplane on "The Production of Aeroplanes and their Components." May I venture to remark, with reference to his account of saw mills and wood-working shop, the plant he suggests, in my opinion, is hardly sufficient to produce aeroplanes in paying quantities.

The necessary machines, as a sound business proposition, should consist of: a horizontal band-saw, for breaking up large timber, so that you can see how the timber will work out for the next cut; one power-feed saw, two thicknessing machines, one panel planer, one four-cutter moulder, one plain saw bench, six (not less) spindle moulding machines, one band-saw (3 ft.), one sander, one boring machine, one fret-saw, saw sharpening and grinding machines (selected). With above plant the production would be large enough to go in for supplying builders with the woodwork parts.

Any firm contemplating going in for aeroplane manufacture (the trade of the future), cannot hope to succeed with less. Another very serious consideration is the position of each machine in the saw mills, for the greatest production with less labour. Mr. Blakeney's account of timber storage is very interesting. (Signed) J. J. Buckley.

[In reply to the criticism of Mr. Buckley, I am sorry that he has not noted the small details in my article, as he will, if he reads it again, see that I have specially mentioned the fact that I refer to a "Small but enterprising" firm who, having existing machinery, wishes to utilise it for the production of Aircraft Components, and, further, an engineering firm might not be expected to be fully equipped as a wood-working firm, and would only have machinery for ordinary work, and possibly not much of that, but enough for a beginning.

I am afraid that Mr. Buckley has misunderstood my term "breaking up timber," as I do not consider a horizontal band-saw necessary, except for use in the forest where the timber is felled, and I am not aware that it is ordinary practice.

Also, I hardly think that any wood-working department in a small firm could possibly require six spindles, unless they were supplying spindled work for a number of outside firms, or employed about 500 to 600 hands, as the output of one or two spindle hands, who know their work and are properly and efficiently fed with work, is enormous. For instance, 16 ordinary spars are frequently spindled per 12 hour day per man. I also

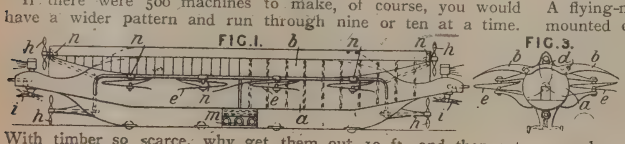
pointed out that the layout of the saw mill required very careful consideration. I can only say that Mr. Buckley's ideas are very much larger for a small firm starting than my own. Herein lies the difference, and the answer is "Capital" £ s. d.—S. B.]

II.

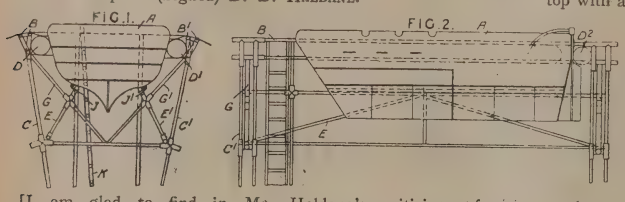


Sir,—May I offer a few criticisms on Mr. Blakeney's article in last week's Aeroplane. It grieves one to see such methods set forth as examples of practice in vogue in aviation firms of to-day, for it gives the impression that we may still be looked upon as a set of amateurs. (You will remember in the early days how the "Engineer," and other superior journals, used to "rub it in.")

To use the spindle in the manner suggested by Mr. Blakeney would entail altering the jig each time the cutter was ground (and, believe me, cutters do need sharpening sometimes), or else the job would come out over size, equal to the amount taken off the cutter. The proper way would be to work the jig against the ring, which can be adjusted to suit a cutter of any length. But using the spindle for the longerons is wrong altogether.

First, a piece of wood ought to be got out, about 2 in. or 3 in. wide, the length of the longeron, and tapered from 1 9/32 in. to 1 1/32 in. This can easily be done on the overhand planer. The sawyer will use this to bring the longerons off the saw at the proper taper. Finished with the saw and inspection, the longerons would be brought to the overhand to have two edges made dead square: then to the thicknesser with them (our man calls it the mangle). The pattern the sawyer used is also necessary for this operation.

Place two longerons on this pattern, the thick end of the longeron to the thin end of the pattern. Set the table to suit (2 5/16 in.), and push them through, turn them on the other edge, then push them through again. Result—a clean accurate job with a saving of, at least, 50 per cent.



If there were 500 machines to make, of course, you would have a wider pattern and run through nine or ten at a time.

With timber so scarce, why get them out 19 ft. and then cut them in two?

The struts can be tapered on the overhand, without jig or pattern, by merely setting the cut to suit the taper.

To have the timber inspected after sawing, as suggested by Mr. Blakeney, cannot be too much emphasised. It saves both time and temper. (Signed) D. D. Haldane.

[I am glad to find in Mr. Haldane's criticism of my article, that he has been lucky in finding such excellent workers on aeroplane work under his charge, and that they have been natural experts, as, personally, I have found that however well one is trained one has lots to learn. I was speaking of a small minority.

With regard to the use of the spindle in the manner mentioned, this method will be found in daily use in dozens of shops, also the spindle hand checks his cutter distance each time he sharpens, and adjusts, if necessary.

I much appreciate the method employed by Mr. Haldane for spindling longerons, and think it excellent, and shall certainly adopt the method when I have a quantity to deal with.

I should like to know what methods are adopted by Mr. Haldane in tapering struts on the planer, to prevent over-planing and making the strut too small. What does he use as a gauge or jig? I should greatly appreciate his reply, and would like to go further into the matter with him, as it bears on a large field of other work.—S. B.]

A REGISTERED TRADE MARK.

Arrol-Johnston, Ltd., Heathhall, Dumfries, Scotland, announce that their application for the registration of their trade mark, consisting of the words "Arrol-Johnston," has been accepted in Class 22 in respect of motor cars under Sub-Section 5 of Class 9 of the Trade Marks Act, 1905, and they have been notified by the Registrar of Trade Marks that the mark applied for be deemed a distinctive mark.

THE PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by The Aeroplane from the current Official Patents Records.

Patent Applications.

Browne, W. M. Hangars. No. 9160. June 26th.
Cazanave, A. Aeroplanes. No. 9119. June 25th.
Chambers, M. F. Inclination indicators for aircraft. No. 9161. June 26th.

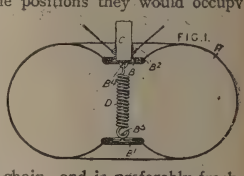
Thornhill, R. Liquid levels or indicators for aircraft. No. 9286. June 28th.
Wallis, H. E. A. Apparatus for observing, photographing, dropping bombs, etc., from a height. No. 9098. June 25th.

Complete Specifications Accepted, printed copies of which are obtainable on and after July 19th, 1917.

107,208. Sept. 26th, 1916. Robson, J. Aeroplanes and the like.

Abridged Specifications.

105,948. Aeronautics. Holroyd, T. H., Royal Colonial Institute, Northumberland Avenue, London.



Aerial machines without aerostats; propelling; steering.—A flying-machine comprises a body *a* having gliding planes *b* mounted on longitudinal pivots *d*, a number of lifting-screws *e* arranged beneath the planes, propellers *h* mounted at both ends of the machine above and below the centre line, and elevating and depressing planes *i*. The planes *b* serve to carry the main weight of the machine and can be moved to any angle by control ropes or wires. The lifting screws, propellers, etc., may be operated by independent turbines or electric motors *n* supplied with power from power generators *m*.

106,001. Airships; aerial warfare. Liversedge, A. J., 14, Great Smith Street, Westminster.

An airship, particularly of the rigid type, is provided at the top with a turret serving normally as a platform for guns, searchlights, etc., but constructed in boat or like form or otherwise made buoyant for use in case of a descent at sea. In the form shown, a boat-shaped turret A fitted with floats D, D^1, D^2 is arranged between longitudinal members B, B^1 of the airship framing, and is fitted with rails J, J^1 adapted to rest on longitudinal girders E, E^1 connected to radial frame members C, C^1 and diagonals G, G^1. The floats D, D^1 may be tied to the longitudinals B, B^1 by ropes or other material adapted to be readily cut to detach the turret. A ladder K affords access to the turret.

105,977. Pneumatic springs; aircraft. Sloper, T., Southgate, Devizes, Wiltshire.

A cushioning-device for aircraft consists of an air-cushion A provided with one or more internal ties D whereby two opposite sides are drawn in relatively to the positions they would occupy under inflation if free, the air-cushion being so shaped that, when tied in, it is approximately circular in a plane parallel with the tied-in sides, and means are provided for securing one of the tied-in sides to the part to be cushioned. The tie D may be a rigid link or may be of flexible material, for example, a spring or chain, and is preferably freely hinged at its ends. The air-cushion is secured to plates, B, B^1 which are provided with eyes B^4, B^5, to receive the tie D, the upper plate B being provided also with a socket B^2 for the end of a spar C. The upper plate B may be replaced by a ring mounted inside the cushion and either secured directly to an horizontal supporting-member or secured thereto through a second outer ring. An internal lining for enclosing the tie and securing plates may be provided to prevent leakage of air. When a number of cushions are arranged one behind the other on any particular part of an aircraft, they are graded in size to present a streamline form, and they may be enclosed in a common cover of

canvas. The air-cushions may consist of two hemispherical portions joined by a flexible joint such as is described in Specification 21863/13, and may be constructed of the fabric described in Specification 25605/13. Specification 9045/14 also is referred to.

MARKET REPORTS.

Prices given are for quantities on usual terms.

COPPER.—There have been no fluctuations whatever in the Copper Market during the past month, and no interest whatever appears to be shown in this market.

Current Prices.

Copper Ingot (standard), Cash	£130	per ton.
Copper Sheet	£165	per ton.
Copper Tube	20½d.	per lb.
Brass Sheet, 24 G.	16½d.	per lb.
Brass Tube S.D.	17d.	per lb.

TIN.—The Tin position is still very uncertain, and buyers are very cautious. Apparently the Government have agreed to supply U.S.A. with tin, and there is no doubt that the demand from this direction will soon become very considerable.

During the past week prices have again advanced to £245, and declined to £243, which is the figure to-day.

Comparative Prices.

To-day	£243 5s.
Last Week	£243 15s.
Last Year (1915)	£172 0s.
Highest Price, 1916	£205 0s.

LEAD.—The continued slump in the Lead Market still prevails, and there is no indication of an improvement. If we could be assured of good supplies from Spain the outlook might be a little brighter, but, unfortunately, the troubles there are having a serious effect upon output.

The official price still remains at £30 10s. to £29 10s.

STEEL.—There is a very hopeful feeling in the Steel Market, due to increased output; at the same time it must be borne in mind that the phenomenal demands for national requirements is increasing very rapidly, the last statement being especially applicable to aircraft steels. We understand that, owing to very urgent Admiralty requirements, the output of aircraft steels has been seriously hindered; this is very deplorable, and steps should be taken to remedy this state of affairs. If America could only be induced to help us by supplying certain grades of steel at reasonable prices, the market would be helped considerably, but very little relief is being received at present. As a matter of fact, we are asked to pay twice as much for steel as the English firms are allowed to charge. There does not appear to be any reason why the American Government should not take control of prices.

There appear to be ample supplies of R.A.F. steel sheet, and market prices are fairly reasonable.

Current Average Prices.

R.A.F. 3B Steel	38s. to 40s. per cwt. Basis.
R.A.F. 1E Steel	78s. to 80s. per cwt. Basis
R.A.F. 9A Sheet Steel	32s. to 33s. per cwt.

ALUMINIUM.—Official prices are still the same.

Current Official Prices.

Ingot	£225
Remelted	£210

TIMBER.—The Timber Market is extremely difficult, and the chief concern at present is supplies. The outlook cannot be considered bright. Stocks of Silver Spruce are gradually diminishing, there is very little Mahogany and still less Walnut. There are ample stocks of English Ash, but the demand for this wood for Aeroplanes is on the decline. The present time is certainly considered an opportune moment for large shipments of Silver Spruce to be brought from Canada; in fact, if something is not done quickly to more than replenish the diminishing stocks, the situation next spring will be worse than critical. There have been a few shipments of Mahogany received recently.

Prices still remain very firm, and contrary to expectations, particularly official expectations, the arrival of Admiralty shipments of Silver Spruce has not affected the high prices which have now been ruling for the past few months.

Current Prices.

Silver Spruce, 17s. c.f.
English Ash, 13s. 6d. to 15s. c.f.
Walnut, 2s. 3d. to 2s. 6d. s.f.
Mahogany, 2s. 2d. to 2s. 4d. s.f.

FABRIC.—It is very difficult to understand the ways of officialdom. Seeing that the fabric supplies have been under A.B. control for nearly six months, one would naturally expect they would, by this time, have notified aircraft constructors what price would be charged.

Official Prices (reported).

17C Cloth,	29½d. per yard	36 in. wide.
17C Cloth,	31d. per yard	38 in. wide.

THE AIRCRAFT WORKERS' SPORTS.

All work and no play makes Jack a dull boy, so the aircraft workers of the London District are going to hold their Annual Sports on Saturday, July 21st, at Stamford Bridge Athletic Grounds.

The meeting, which is to start at 3 p.m.—weather and bombs permitting—will be held under A.A.A. and N.C.U. Laws, and under the auspices of the Y.M.C.A. The events will be as follows:—

Description of Events.

*100 Yards Flat.—Run between strings 4 ft. apart up the centre of ground.

Veterans' Race.—Same conditions, with half a yard per year over 41 allowed.

*220, *440, *880, *One Mile Flat, and *Two Mile Walk on running track.

Cigarette Race.—A number of men are lined up facing an equal number of women about 40 yards away. The men have to run up to their lady partners, who light the cigarette in the man's mouth, and the pair then run back to the starting point. The first pair home with the cigarette still alight are the winners.

Sack Race.—Sacks reaching to the neck are used, and each competitor must keep his arms inside the sack. The race is started from the lying-down position facing the opposite direction, turning round and running forward about 40 yards round a turning point and back to the starting point.

Sack Race (Women).—Same conditions, but for women competitors.

*One Mile Relay Race.—Teams of four men each. The position of each team on the track is drawn for (the positions are numbered from the inside of the track). The first man runs 220 yards and hands over the flag to the second man, who also runs 220 yards and passes the flag to the third man, who has to run 440 yards and pass the flag to the last man, who has to do 880 yards or twice round a quarter mile track. The race finishes when the 880 runner has reached the finishing post. Each man in the winning team receives an equal prize.

*Long Jump.—Competitors take a running jump from a white marked board sunk level with the turf, into a pit of loose earth or sand. The jump counts from the take-off board to the mark made by the competitor's heel. The jump does not count if the man steps over the line or falls back after landing in the pit.

*High Jump.—Under usual High Jump conditions.

60 Yards Flat for Women Only.—Start 40 yards up the 100 yards strings and finish at the posts.

Boat Race.—Each team of five men and a cox. stand astride a pole which is held up between the legs. The team runs backwards and is steered round the track by the cox., who faces the direction the team is running. (Just the same as an ordinary boat race, except that a pole is used and the competitors run backward astride the pole.)

*Tug-of-War.—Eight men in each team, any weight. The rope is marked with a tape six feet each side of the centre tape, and the ground marked correspondingly. When the side tape is pulled over the ground mark on the other side of the centre line—making a 12 ft. pull—the pull is finished.

½ Mile Boys' Relay Race.—Same as the Mile relay race, except that each boy runs 220 yards. (For boys under 16 years of age.)

100 Yards Flat.—Same as for men, but competitors must be under 16 years of age.

Obstacle Race.—Run on a separate course inside the running track.

Pillow Fight.—A pole is supported on tripods about 4 ft. above the ground, and each competitor has to try and upset the other's balance by striking him with a soft pillow. Competitors are disqualified if they touch the pole with the hands.

Cycle Race.—½ mile round track.

Cycle Race.—3 miles round track.

*The ten events marked with an asterisk, thus *, count for the Aircraft Works Championship.*

Entries may be sent in by any firm in which not less than 75 per cent. of the workers in the particular department entering are employed on aircraft work. Entries must be in the hands of the Hon. Secretary by Saturday next, July 14th, though one ventures to suggest—quite unofficially—that if the employees of any firm only decide to enter on Saturday, and lodge their entrance fees by Monday morning, July 16th, they will be accepted as competitors.

The entrance fees are 1s. per man for the first Championship event, and 6d. per event afterwards. For boys the entrance fee is 6d., and for women 4d. each event.

All correspondence, entrance fees, etc., should be addressed to the Hon. Sec., Mr. J. T. Clark, Y.M.C.A. Building, Tottenham Court Road, W.C.

The following firms have already entered teams for the

WORKS & OFFICES: { CRISP ROAD, HAMMERSMITH, W.6. / CHURCH WHARF, CHISWICK, W.4. } LONDON.

TELEPHONES: 1910 HAMMERSMITH (3 lines). 1780 CHISWICK (3 lines).

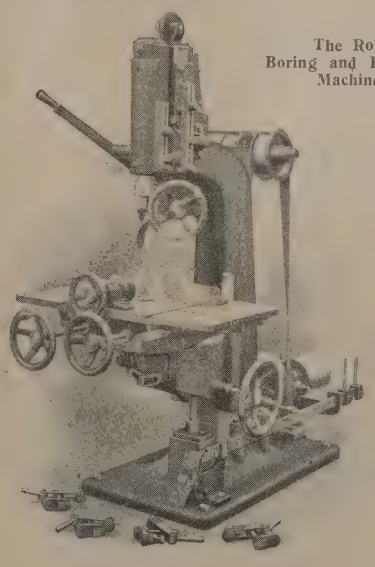
TELEGRAMS: "GWYNNE, LONDON."

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Championship events:—Integral Propeller Co., Darracq, Napier, Gwynne, Handley Page, Grahame-White, Aircraft Mfg. Co., Wells, British Light and Ignition (Blic), British Caudron, Palmer Tyre, Aircraft Supplies Co., Highgate Aircraft, Triplex Safety Glass, Hooper, Improved Liquid Glue (Croid), British Cellulose (Novellon), Rotax Accessories, Cellon, Glendower Aircraft, Whitehead, Sopwith, and Maple.

Last year only ten firms entered, and they provided 1,500 competitors, so this year the officials of the meeting seem likely to have a fairly busy time.

Prizes have been given by the following firms:—Triplex (Challenge Trophy and Cup), British Cellulose (Cup), Aircraft Mfg. Co. (Cup), Aircraft Supplies Co. (Cup), Whitehead (Trophy and two Cups), Auster (Cup), Darracq (Cup), Highgate Aircraft (Cup), Cellon (Cup), and THE AEROPLANE (Cup). Donations have been given in addition by the following:—Highgate Co., Hooper, Napier, Integral, Croid, Darracq, Palmer, Aircraft Mfg. Co., Auster, Triplex, Goldsmiths' and Silversmiths' Co., and THE AEROPLANE.



Given anything like decent weather, the attendance is expected to exceed 10,000, so adequate provision is being made for teas and light refreshments. The prices of admission will be 6d., 1s., and 2s. 6d. (including amusement tax); children under 12 will be admitted at half price, and sailors and soldiers in hospital uniform will be admitted free of charge.

A BORING AND RECESSING MACHINE FOR AIRCRAFT.

A special boring and recessing machine for aircraft work, which has recently been evolved by Thos. Robinson and Son, Ltd., of Rochdale, is shown in the accompanying illustration. It was primarily designed for boring the bosses of airscrews and propellers, but may also be used for recessing and routing out panels in ribs and spars, either from the solid or in 3-ply.

The ordinary type of boring machine, particularly where the spindle passes through the bearings, failed to satisfy the demands for exact work and range of movements required in the boring and recessing of propellers.

The machine now illustrated is claimed to leave a perfectly clean and true centre hole in the boss of the largest propeller,

The Robinson Boring and Recessing Machine.

using a two-wing twist bit as known to most machine woodworkers.

The makers claim an important improvement in the mounting of the spindle, the whole head, with its bearings, rising and falling bodily, giving the maximum support to the spindle at every position. The bit need only be steadied by its own shank in the spindle chuck, and by simply changing the boring bit or tool, a propeller boss can be completely bored, rounded on the edge of the hole, recessed when necessary, and the bolt holes drilled without disturbing the setting of the work, i.e., the propeller of the machine table.

A feature of the machine is the compound movements of the table, which give all the required positions for drilling the various holes.

When recessing panels in the ribs and spars of aircraft, a profiling, or forming plate, is used below the work, to give the shape of the panel required; the work being passed under the cutter by hand-feed.

A large diameter cutter-block, or recessing cutter, of suitable shape is all that is necessary for half lapping, the timber being traversed past the cutter by hand-wheel and screw to form the recess or half lap.

The new machine offers a solution of the one speed objection often found in boring machines of the old type. Many only give one speed of about 1,000 revs. per minute, while the machine now described has three speeds, viz.:—1,200, 2,000, and 3,000 revs. per minute.

The spindle-head has a vertical movement by hand-lever of 6 in., and by screw 6 in., the maximum combined movement being 10 in. The distance from the centre of the spindle to the machine pillar is 18 in., and the spindle is arranged to swing cutters up to 7 in. diameter in the top-most position. Larger cutters can be used when the spindle is lowered slightly.

The table is 39 in. by 19 in., and is slotted to carry a back fence and screw cramp, and also eccentric lever cramp. It has a longitudinal traverse by screw of 15 in., and a cross traverse by screw of 9 in. The maximum distance between chuck and table is 24 in. The table will cant 30 deg. sideways and to the front. Adjustable stops are arranged to pre-determine the movements required.

The fast and loose driving pulleys are 8 in. diameter by 4½ in. face, and run about 750 revs. per minute. This machine, although primarily designed for aircraft work, it will be readily understood, has a wide application for general woodworking, especially where large multiple or fine limit work is required. The makers urge that it is not only useful "for the duration of the war," since it will be a live and economic factor in any scheme for changing over from War to Peace work.

MEERLOO—HIS MARK.

Neolithic man was fond of making marks—chiefly upon the cranium of his next cave neighbour, and like any other human attribute which one cares to mention, the tendency has developed throughout the ages.

Any amateur archæologist will take one round the Babylonian Hall at the British Museum and will point out with something approaching self-satisfied smugness how the Ptolemies and the Rameses commemorated the more successful enterprises of their expeditionary forces by erasing the names of conquered monarchs from tombs and monolithic edifices, and by appending their own names in the current edition of "Pitman's own."

The penchant for making marks ran through successive ages and stages, expressed by Julius Cæsar in writing, by Caxton in type, and by the mid-Victorian schoolboy with his pocket-knife upon the walls of the family pew.

This is but a digression, if one can digress before one has started. It is merely an illustration that there is nothing new under the sun.

The duty of the moment is to introduce to the Aircraft Industry a firm which specialises in the making of marks—big and little.

Messrs. John Meerloo and Sons, of Cleveland Street, Mile End, E., have for many years been engaged upon the production of marking materials of all kinds.

Steel stamps of various kinds are supplied to the Aeronautical Inspection Department for marking both wood and metal parts, special attention being given to the manufacture of very small stamps for A.G.S. parts and similarly minute articles.

The firm supplies standard sets of letters and numerals of all sizes for stamping and branding steel, iron, leather, and wood, and practically every other material, to say nothing of animals.

Messrs. Meerloo and Sons also manufacture stencil plates and brushes for marking both aeroplanes and their packing cases. It is hardly necessary to mention that any inquiry, mentioning THE AEROPLANE, will receive careful and prompt attention.—W. L. W.

CHROME NICKEL STEEL.
CARBON STEEL.
Nearly 800 special sections, illustrated full size.

IMPORTANT TO AEROPLANE BUILDERS.

To those building or tendering for Aeroplanes it might interest them to know that we hold complete tools for many of the components of the following machines:

B.E.2C-D-E & B.E.12. R.E.7 & R.E.8.
F.E.2B & D. F.E.8. S.E.5.
SOPWITH (110 h.p. CLERGET & F.I.).
AVRO, BLERIOT and H. FARMAN.

All kinds of tube manipulation can be effectively dealt with at our works.

We also have excellent facilities for coping with
PRESSWORK, SOCKETS, FERRULES, TUBULAR OR SHEET-METAL FRAMEWORKS.

Please send details of your wants.

The work at present in hand for the above includes RUDDERS, FINS, ELEVATORS, STAYS, SOCKETS, CLIPS, LEVERS, EXHAUST SETS, WIRING PLATES, &c.

A complete up-to-date list of parts in stock or in progress will be sent on application.

WE MAKE ALL SIZES AND TYPES OF TUBULAR BOX SPANNERS.

STILL MORE PROOF

Dear Sirs,—Please find enclosed one pair of Triplex Goggles, which were broken yesterday, when I had the misfortune of crashing a fast experimental machine.
You will be pleased to hear that **Triplex saved my eyes** from being badly cut, and will be also interested to learn that the **Triplex windscreen was unbroken,** though the immediate surroundings were battered.
Faithfully yours,
Signed.....

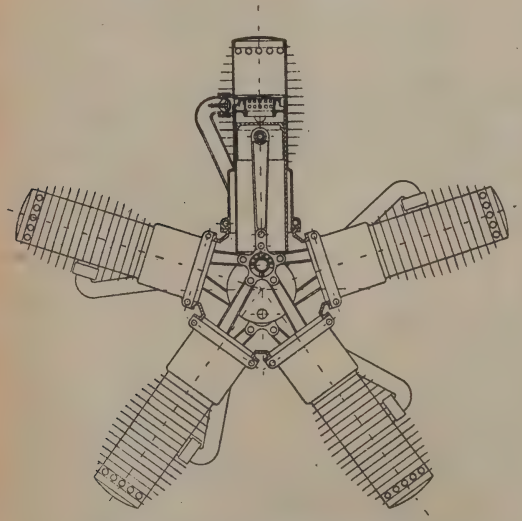
AERO-MOTORS
IN KIND AND CONSTRUCTION

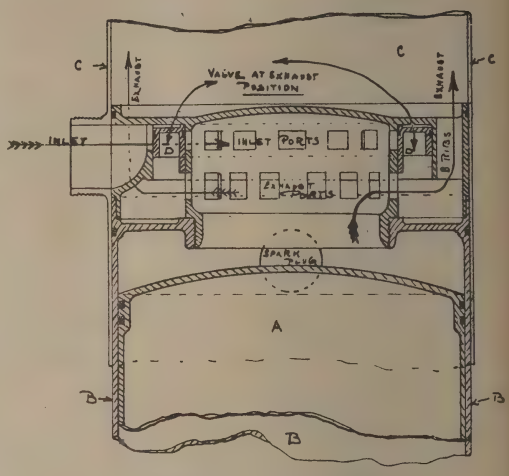
By Geoffrey de Holden-Stone

The Likeness of the Unlike.



As one continues to analyse two-stroke practice, the more do two conclusions become evident. The first is that the successful designer must not only be a physicist, but that he must really look first of all to physics to provide or suggest his mechanical means. And the second is the extraordinary similarity of the working principles employed, the manner of employment being, as often as not, the sole difference: patentable, at any rate.

So much so, that scanning the mechanical part of the proposition for the first time, one wonders how possibly infringement can have been avoided—especially if the mechanical consequences are identical, as often happens—until one finds that the purely physical methods have somehow constituted the originality.



Never have I seen such a positive example of this as the Chadderton two-stroke radio-rotary motor—it may be worked either way—as compared with another, which is the subject of much quaint official secrecy at the moment, although its patents have been published for the last few years. So alike are both, indeed, that one would say that the latter had priority in all the more important physical and mechanical results, and that it was only the combination of these with certain minor details—physical again as well as mechanical—that saved the situation for the former. The other motor, nevertheless, is the simpler, being absolutely valveless; whereas Mr. E. Chadderton's design does embody one valve for each cylinder. At the same time, if made up as a vertical or V type, as the other is, I see nothing to prevent it being made up to equal power-possibilities—which I happen to know are extraordinary—far greater than in its roto-radial types as illustrated.

Type and Variation.

Here, again, one would imagine off-hand that such a thing as an *automatically operated exhaust valve*—positively operated by the difference of pressures above atmospheric, not minus as in ancient four-stroke practice, combined with a certain amount of centrifugal action—was somewhat of a novelty. However, such a one is the Chadderton valve.

General Scheme of the Chadderton Motor.

Port Arrangement of the Chadderton.

Yet Mr. Frederick Lamplough in a four-stroke practice patent did the same thing years ago, with a pot-shaped type of valve fitted with piston-rings. I too plead guilty. The chief difference was that the Lamplough design employed one such valve for the induction and another for the exhaust. I, on the other hand, by different means, including an outer sleeve, made a single valve—consequently much wider, with less lift—serve both purposes. Just as the Chadderton design does. But the Chadderton valve is not pot-like—being of annular channel section—and has no piston rings nor any auxiliary mechanism. Which we may freely admit is the next best thing to the absolutely valveless proposition I prefer. Even a success does not wholly satisfy.

The Common Aim.

Generally, the purpose of the Chadderton design is the same as that of the nearest compeer aforesaid: that is to obtain greater reliability, to give more power for a given weight without any special lightening of the construction—thus leaving all possibilities in that direction well in hand—to reduce noise and vibration; and finally to secure this last result by balancing the pressure of the gases—both in compression and combustion effort, as well as the reciprocating parts.

Both, curiously enough, get all these results by precisely the same physical and mechanical means, as will be presently seen. Yet the working cycle of each is different.

Thereby, they succeed, where Koch and the original Arrol-Johnston, the Lanchester, Ochelhauser, Junkers, and the Gobron Brillie just failed. All these latter, it is true—which embody duplicated pistons working in opposite directions—have managed to balance the explosion effort, but they failed to balance the reciprocating parts as well by combining both kinds of balance for the motor as a whole.

All of them again—in addition to valve troubles and loss of power sustained in valve-gear operation—possessed certain inherent defects of design, wholly irremediable as that design stood. Some too, such as the Ochelhauser, the Clerk and others,

SUCCESSFUL FLIGHT can only be attained by ensuring maximum efficiency in all departments. **FOSTER PYROMETERS** place maximum efficiency in Heat Treatment within the reach of relatively unskilled operators. CATALOGUES & QUOTATIONS ON REQUEST.

had also two or more pumping cylinders apart from the working ones: so were rather more complicated than usual, and cost more to build.

And its Joint Success.

But in these two special cases—in which the combustion chamber actually moves up and down—a positive all-over balance is created. Furthermore this great mechanical result is obtained—as will presently be seen—that owing to the special combination of the two pistons in each cylinder with the crank-shaft, the whole of the combustion stresses are taken by the pistons, and not by the cylinder at all.

The unique physical feature of the Chadderton design, however—and therewith the embodiment of its chief purpose—is that the induction system is such that it is practically impossible for the motor to take fire during flight or at any other time. Not only is there no mixture in the crank-chamber at any time, but *none even reaches the cylinders until just before the moment of combustion.*

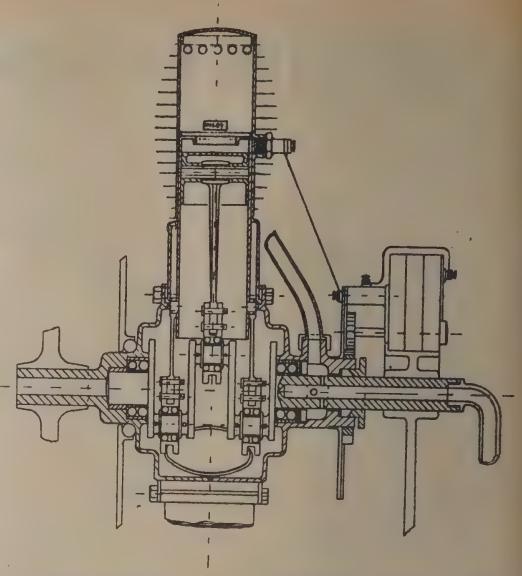
The Mechanics Thereof.

Now it is known that the two chief factors of efficiency in any i.c. motor are extreme volume combined with extreme rapidity of expansion after ignition. This is secured in both cases by means of two concentric pistons—that is, closely fitting one within the other—the inner one being of the ordinary type, but the outer one in the form of a sleeve of such a length that it still contains the inner piston when both are at full outstroke.

The inner piston is connected by a single rod to the middle crank, and the sides of the outer piston by two rods to the outer—and opposite—cranks of a three-throw crank-shaft element. This single shaft element of course suffices for either the rotary or radial type of the Chadderton; but, as with the other, in its vertical or V type, it is continued with one, three, or five further elements to make up the battery of two (or four en V.), four or eight, six or twelve.

Some Special Consequences.

In both cases—and in all available types—certain unique results follow from this arrangement. In the first place, with the combustion shock driving the pistons apart on opposed cranks at 180 deg., the crank-shaft is, so to say, floated between the opposed—or rather double-ended and bi-motional—efforts. Consequently not only are the torque stresses distributed evenly round the shaft-mass in half the time, but it is practically impossible for knock to occur in the bearings; which are thus reduced to mere guides for shaft rotation with all wear eliminated beyond what occurs from rotary friction.



Secondly the weight of the sleeve piston in any cylinder is balanced by the compression of the charge (or the induced air) beneath it and by the weight of the corresponding piston in the next cylinder. This is so in both the roto-radial Chadderton and in the vertical other make: the balance thus effected being practically perfect.

But in any V type arrangement of either, it will be obvious that the sleeve piston in one cylinder must precisely balance the sleeve piston directly opposite to it, so that the perfection of balance both of combustion efforts and reciprocating parts must be made absolute.

And a fourth unique feature of this crank-shaft arrangement is this, that the leverage effect of these opposed cranks is practically doubled for their given length as compared with the ordinary crank-shaft: the throws being halved as well as the piston-speed. Inertia stresses, being opposed, also cancel each other out, and as we have seen, vibration has also been eliminated. Consequently certain further peculiar points arise. One is that every inch of throw-increase becomes equal to two inches in the ordinary way. Added to this—paradoxically enough, it being the converse of long-observed results in conventional practice—the longer the stroke the higher the revolution speed becomes. Which is all to the good, seeing that shaft-speed in r.p.m. is the soul of i.c. motor-power anyhow, within limits, and has hitherto been the chief limitation in two-stroke practice.

The Outcome—and the Difference.

So the final outcome for the Chadderton motor as well as the other valveless one, is that a power-stroke—"double-ended" and hence twice as long—and a leverage effect twice as great can be obtained with cylinders of no greater length, and a crank-chamber neither deeper nor wider, than in an ordinary motor of half the stroke and crank-throw. The possibilities then of this order of design for the creation of a really hefty power-packet—yet withal of a comparatively medium r.p.m. speed—need hardly be argued.

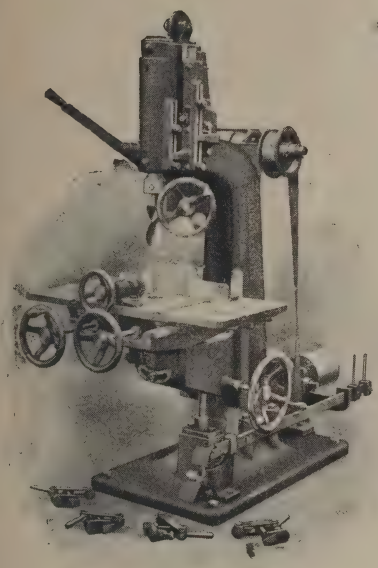
Section through Shaft of the Chadderton Two-stroke Rotary Motor.

From this point, however, the ways of design divide; and the individual differences between the Chadderton motor and the older one become apparent. In both cases the cylinder proper is a mere piston-casing and guide, sustaining no whit of the explosive shock; therefore needing but the lightest attachment, and incidentally, capable of being made of any suitable light alloy of sufficient toughness, and a low coefficient of expansion; good but not excessive radiating and anti-frictional quality being also highly desirable. So the mere fact that the Chadderton motor as shown happens to be air-cooled while the other is water-cooled is a mere type consequence.

Again, the outer piston in each case is naturally of the differential type with the cylinder likewise enlarged to form an annular pumping chamber around its lower part.

But here comes in the difference between the Chadderton and not only the senior design, but any other motor: and most of it is comprised in the special pressure-operated centrifugal valve, which is really the mechanical gateway to the entirely novel induction system and its result, which is the chief object of the design.

As will be seen from the larger illustration, this valve is of channel section, and fitted like an annular collar around, and within the top of, a dome-like extension—the actual combustion chamber—screwed into the head of the outer piston. And it will also be seen that the inner flange of the valve is the deeper: so much so as to cover either of the upper or lower rows of ports cut in the combustion chamber and the intermediate metal thereof.



The immediate questions then are, why are the ports set in contiguous series? and why is the inlet series above the exhaust? To the former, the answer is that the same valve has to cut one and the other series out and in alternately—which obviously allows no great movement—and to the latter that it is above all things desirable in two-stroke practice to separate the induction entry—especially if under pressure—as widely as possible from the final exhaust exit. Which great principle, curiously enough, was chiefly, if not solely, established by the designer of the other motor, after years of costly experiment.

SPINNERS OF A SUPERIOR QUALITY OF FINE SEA ISLAND YARNS SUITABLE FOR LACE, MUSLIN, HARNESS TWINE & SEWING THREAD MANUFACTURERS

DELPH HILL MILL, HALLIWELL BOLTON

Lostock Junction Mills, near Bolton England.

We have the longest experience in the trade in spinning Special Superfine Combed Yarns for manufacturers of Aircraft Fabric. We do not belong to any ring or combine. 263,000 Spindles.

(*Continued from page 90B.*)

as a pilot and by his mental ability, and was gazetted a flying officer in October, 1914.

On active service his outstanding qualities were soon displayed. He won the D.S.O. on April 19th, 1915, for his gallantry and cleverness in bombing an airship shed at Gontrode in Belgium, when he descended to 200 ft. to make sure of his aim. The shed was protected by a kite-balloon, which Lieut. Hawker (as he then was) used as cover against guns below. By coming down directly above it in a small spiral, he prevented the guns from firing at him for fear of hitting the balloon, and the men in the balloon basket were unable to see him to fire at him. He dived past the balloon and then resumed his small spiral underneath it, so that again the gunners were afraid to fire upwards, and the balloonists were afraid to fire downwards for fear of hitting the people on the ground. As a result he burnt the shed and returned untouched.

The feat by which he won the V.C. on July 25th, 1915, was the culmination of a long series of successes against enemy aeroplanes. The citation says :—"When flying alone he attacked three German aeroplanes in succession. The first managed eventually to escape; the second was driven to ground damaged; and the third, which he attacked at a height of 10,000 ft., was driven to earth in our lines, the pilot and observer being killed. The personal bravery shown by this officer was of the very highest order, as the enemy aircraft was armed with machine-guns, and all carried a passenger as well as a pilot." This award appeared in the "Gazette" of August 25th, 1915.

Thereafter his career was one of continuous success. He combined in a most remarkable degree skill as a pilot, ingenuity as a mechanic, accuracy as a shot with machine-gun or pistol, and bravery as a fighter. These qualities alone were sufficient to make him the best air fighter of his day, but over and above them he possessed administrative ability of a very high order, and the faculty of leadership, so that his junior officers and men loved him as a man and respected him for his capability as a commanding officer.

When he became a squadron-commander, not only was his squadron always to be relied upon morally as a fighting unit, but it was always so efficiently organised as to be ready at any moment to do effectively whatever work was placed upon it. So highly was he esteemed by his seniors that it was generally recognised, just before his death, that he was to take command of the next wing to be formed, and had he lived there is little doubt that in little more than a year he would have had a brigade, so that he would have rivalled General Freyberg in youthfulness among Brigadiers.

Lanoe Hawker belonged to the famous West Country clan of Hawkers and was related to the well-known novelist Lanoe Falconer—hence his peculiar first name and the novelist's assumed second name. He was born and brought up as a child in Australia, so that the Southern Continent may claim some of the credit for producing one of the most brilliant young officers in the British Army.

Personally he was an excellent example of the British professional soldier—and one can imagine no finer type among all mankind. He was well built and athletic, short rather than tall, and distinctly good-looking. He possessed a singular charm of manner and a magnificent sense of humour, which might have misled one into thinking him to be merely the amiable and intellectual young English officer whom everyone likes, if it had not been for his eyes, which had that curious tigerish quality which, to the observant, always indicates the born man-killer, and in his case made just the difference between a very clever sapper officer and one of the greatest exponents of air fighting whom the war has produced.

When Lanoe Hawker died the public news sheets had not discovered the value of air fighters as "star turns," but in his day he was a more than worthy predecessor of Immelmann, Bölcke, von Richthofen, Guynemer, Nungesser, and our own most efficient chaser pilots. All who have served under him or with him hold him in the deepest affection and respect, and to-day, when enthusiastic young officers are acclaiming the merits of some particularly efficient and popular squadron or wing commander, one may hear some war-worn veteran, aged about twenty-two or so, cut in with the remark, "Yes! But you never served with L. G. Hawker." Let that be his epitaph, for it sums up the esteem in which he was held.—C. G. G.

MACKINTOSH.—Sec. Lt. Charles Mackintosh, R.F.C., whose death at the age of 38 on active service in France was recently announced, was educated at the City of London School, and had been living in Germany for some years before the war. A year before the outbreak of war he crossed into Switzerland, becoming Winter Sports representative of the Royal Automobile Club and a "Daily Mail" correspondent, whose thorough knowledge of the French and German languages was especially valuable. Together with several other journalists he was falsely accused of spying, and for 10 weeks was imprisoned in Berne before the trial by court martial, when he was acquitted. Mr. Mackintosh was very well known in Switzerland in all winter sports centres: the official paper of the Automobile Club de Suisse, in a notice on his death, quotes him as "a great friend of our country, who had done much for the development of sport in Switzerland."

Towards the end of last year Mr. Mackintosh joined the R.F.C. and was an observer in the 18th squadron. The manner of his death was all that an aviator could desire, quick, sudden, and in the middle of a fight with an enemy machine. Shot in three places, he must have died instantly, while the pilot, although mortally wounded, brought the machine down safely, dying himself immediately after landing.

His flight commander wrote: "Two days before, he was up with me, and together we managed to save another of our machines which had two H.A. on his tail. I shouted to old Mac and turned on the Huns and he got his gun on them before you could say knife, and before we were really close they had had enough and turned off home. . . . It was a very great pleasure to have so stout a fellow and one so keen on his job as Mac, and he will not be forgotten in the squadron."

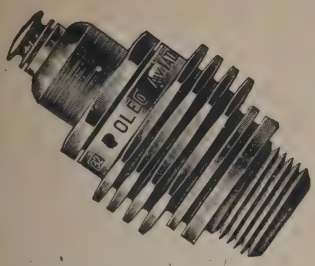
The widow and three children of the late Mr. Mackintosh are living at Gryon-sur-Bex, in Switzerland.

MANN.—Sec. Lt. Stanley W. Mann, R.F.C., killed during a fight in the air with four enemy machines, was educated at St. Olave's Grammar School, London, which he left as a senior Oxford scholar. He began his flying career at the Hall Flying School, Hendon, received his commission in the R.F.C. on March 6th, 1916, and flew to France in June of the same year. He was reported by his Flight Commander as one of their finest pilots. Mr. Mann was the only son of Mr. and Mrs. Walter Mann, of Erncroft, Twickenham, and was 21 years of age.

MARTIN.—Sec. Lt. Fairlie Russell Martin, Royal Scots Fusiliers, attached R.F.C., the only child of Fleet Paymaster W. E. R. Martin, R.N., C.M.G., and Mrs. Martin, was educated at Bedford and Sandhurst. He joined his regiment in April, 1916, and went to the front in the following July, serving with his battalion throughout that year's offensive and in the fighting in the early part of 1917.

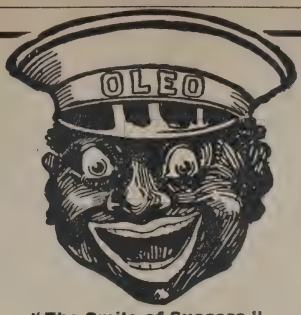
Last March he was attached to the R.F.C., and was killed on June 29th, aged 19, while carrying out important work for which he had been specially selected on account of his excellence as an observer. His squadron commander writes :—"He was one of my most promising observers and showed the most tremendous keenness and cheerfulness over his work. His loss is very much felt both from the point of view of the squadron and personally."

MILLS.—Major Gerald Desmond Mills, R.F.C., who died as the result of an aeroplane accident abroad, aged 26, was the youngest son of Canon Mills, of Bennington Rectory, Herts. He was educated at Haileybury College, and having passed through Sandhurst obtained a commission in October, 1910, in the Sherwood Foresters, in which regiment his elder brother was killed in the South African War. He served 3½ years in India, and, returning home on leave in March, 1914, joined the R.F.C., and obtained his flying certificate.



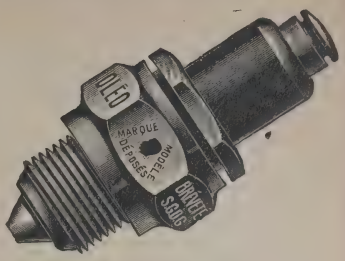
He was gazetted flight commander in March, 1915, and went to France in the following month, and was mentioned in dispatches. He returned as instructor at the Central Flying School in January, 1916, and was gazetted squadron commander in March, 1916. He was appointed to command the Test Squadron in July, and went to the Air Board Office last March, and shortly after applied for work on active service. He went to the front on May 15th, and was killed four days later.

The brigadier-general under whom he served at the Air Board Office writes :—"He was a very fine and very gallant pilot and a real good officer, and he did particularly good work when commanding the Test Squadron. . . . He is a great loss both to the R.F.C. and to me personally."



MOSS.—Sec. Lt. William Thomas Gregory Moss, attached R.F.C., was flying over an aerodrome on July 5th when his machine fell and he was killed.

NIXON.—Capt. William Eric Nixon, K.O.S.B., attd. R.F.C., eldest son of the Rev. W. H. Nixon, vicar of Winster, now Senior Chaplain of the Forces, and Mrs. Nixon, was born in 1897, and educated privately and at King William's College, Isle of Man, where he was captain of the school in 1913-14. He entered Sandhurst by nomination in May, 1915, passed out in November, and was gazetted second lieutenant, being promoted captain in November, 1916. He was twice mentioned in dispatches and three times wounded in action. On May 7th he was reported missing, and is now reported to have been killed while leading his flight. He was buried by the German Divisional Chaplain, with military honours, in the churchyard at Masny, near Douai, on May 11th.



PLATT.—Capt. Lionel Sydney Platt, Lancers, attached R.F.C., the only son of Mr. and Mrs. Sydney Platt, of Wargrave Manor, Berks, was born in 1885, and educated at Eton and Magdalen College, Oxford. He obtained his commission in the 17th Lancers in 1905, and served with them in India, and distin-

guished himself as a gentleman rider. He was appointed Adjutant of the Denbighshire Yeomanry in 1913, and served with them at home and in Egypt.

He joined the R.F.C. in September, 1916, got his wings in November, and went to the front in December. In March he was gazetted Flight Commander, and was killed on April 13th while leading his flight on a reconnaissance. In 1914 Capt. Platt married Miss Gillian Warwick, and leaves a daughter.

POWER-CLUTTERBUCK.—Sec. Lt. James Edward Power-Clutterbuck, Royal Field Artillery, attached R.F.C., killed in action, was the son of Mrs. Power-Clutterbuck, of Newark Park, Gloucestershire, lady of the manor of Ozleworth, and was born in 1893. He got his commission in the Royal Artillery in January, 1915, and recently was attached to the Flying Corps.

PROTHEROE.—Lt. W. B. Protheroe, R.F.C., who was killed on June 21st, aged 25 years, was the younger son of Mr. W. H. Protheroe, of Park Crescent, Llanelly. From 1910 he served in the Territorial R.E.'s, and rejoined as a sapper at the outbreak of war. He obtained a commission in the Welsh Regt. early in 1915, and fought in the Battle of the Somme. Last January he transferred to the R.F.C., and had been flying continuously until he met his death fighting three enemy aeroplanes. He was well known in South Wales Rugby circles.

ST. CLAIR SMITH.—Sec. Lt. Eric St. Clair Smith, R.F.C., attached to the R.F.C. school at Brooklands, was killed through a fall of an Army biplane on July 3rd. Sgt. Wilson, his pilot, was conveyed to hospital suffering from grave injuries to his head and internally. The machine was several thousand feet up when it is alleged to have crumpled in the air. Mr. Smith belonged to Forest Gate.

SHARPE.—Sec. Lt. Maurice Sharpe, R.F.C., who was reported missing on Oct. 28th, 1916, now unofficially reported killed on that date, was the youngest son of Sir Alfred and Lady Sharpe, Elmshurst, Lancaster. He was aged 29.

He served throughout the Cameroons campaign as temporary lieutenant in the Nigerian Regt. After the conclusion of that campaign he obtained his commission in the R.F.C. on June 3rd, 1916, and proceeded to France on Sept. 6th.

STEPHEN.—Sec. Lieut. James Pedraza Stephen, R.F.C., who was killed on May 23rd, aged 19, was the second son of Mr. A. G. Stephen, manager in Shanghai of the Hongkong and Shanghai Banking Corporation. He was educated at Dollar Academy and Glenalmond, where he was captain of the Rugby fifteen, 1915-16, and Pipe-Major to the School Cadet Corps.

He received his commission in the R.F.C. in May, 1916, and after obtaining his "wings" joined the Army at the front in October, 1916. His squadron commander writes:—"He was absolutely fearless as a pilot and had no fear of anyone in the air. There seems little doubt that he attacked two machines below him—a typical action on his part, as he was very keen to make good on the new machines which we have and with which he was delighted. He was shot down, his machine falling in our lines, and died soon after. His loss is felt by the squadron to an indescribable degree."

SYKES.—Lt. Harold Keith Sykes, Royal Fusiliers, attached R.F.C., who died at a casualty clearing station on June 29th of injuries received while flying on June 23rd, aged 25, was the eldest son of the late J. D. Sykes, of Messrs. Few and Co., London. He was educated at Sevenoaks and Haileybury College. When war broke out he was studying law, but at once joined the D.C.L.I. He obtained his commission in the Royal Fusiliers on February 26th, 1915, and went to France in July, 1915. He was wounded on July 15th, 1916, and after some months in hospital joined the R.F.C., obtained his wings, and went to the front.

His C.O. writes:—"Although your son had not been with us very long he proved himself to be one of the very best comrades that one could possibly wish to have, and all through the very strenuous times which we have had on this particular part of the line recently he showed the most undaunted courage, always carrying out his duty no matter what obstacles came in his way. We shall always honour and respect his name." His younger brother, Capt. R. A. Sykes, Royal Fusiliers, died of wounds two months previously.

THORNE.—Capt. Guy Stafford Thorne, R.F.C., missing since March 18th, brought his aeroplane and observer safely to earth on that day, but died of wounds shortly afterwards. He was born in 1882, was educated at the Wolverhampton Grammar School, and became an electrical engineer. He obtained the appointment of engineer to the Chinese Government Power and Light Station at Canton. Shortly after the war broke out he obtained leave of absence, and was given a commission in the R.F.C. He became an expert pilot, soon attaining the rank of captain.

He was the second son of the late Edwin Henry Thorne, solicitor, of Wolverhampton (a lieut.-colonel in the Territorial Forces), and Mrs. Thorne, of The Roseries, Down Road, Bexhill, whose only other son, Lieut.-Colonel Harold Underhill Hatton Thorne, was killed in action on May 9th. He married, in November last, Mary Gwendoline Charlotte, only child of Commander Hillman, R.N., of Invergordon.

TROLLOPE.—Sec. Lieut. William Kennedy Trollope, R.F.C., who died on May 3rd of wounds received in action on April 3rd, was the younger son of Mr. John E. Trollope, F.R.I.B.A., of Esher. Born in 1896, he was educated at St. Christopher's, Eastbourne, and Uppingham. He received his commission in the R.F.C. in May, 1916, and being gazetted flying officer in July, 1916, proceeded to the front. He had been out over the enemy's lines, and was returning when he was attacked by five German aeroplanes at a height of 5,000 ft. His observer was killed, and he was shot in the abdomen. The machine, however, made a marvellous landing just inside our lines, but upside-down. The machine was being shelled on the ground by the enemy when an infantryman went bravely out to bring Mr. Trollope in. The man found him alive, but unconscious, and in carrying him to safety was himself dangerously wounded. His commanding officer writes:—"I need not tell you what a loss he will be to us. He was simply splendid."

VICK.—An inquest was held yesterday in Yorkshire on the body of Sec. Lt. Kerneth Jessen Vick, R.F.C., who was killed in an aeroplane accident, at the age of 28.

An officer said he did not know the exact cause of the accident, but a special Accidents Committee from London would investigate, and the decision rested with that committee. The witness also stated that relatives of men killed accidentally would not be allowed to be present at the inquiry.

The jury, in returning a verdict of "accidental death," entered a protest that even public inquests into the cause of loss of life were now to be put under military control. There was no valid reason why parents should be refused admission to such inquiries or why an English jury should pass a verdict when they had no knowledge of the cause of the accident.

WYATT.—Capt. Felix Wyatt, Suffolks and R.F.C., only and dearly loved son of the Rev. J. D. K. and Mrs. Mahomed, Ingham Rectory, Bury St. Edmunds, was killed in action on July 2nd. He was 28 years of age.

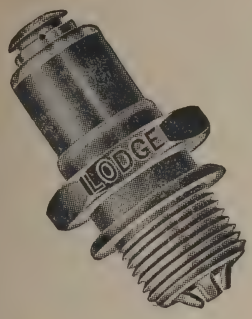
ENGAGEMENTS.

CLARKE—NEILL.—The engagement is announced of Captain A. J. Michell Clarke, Gloucester Regiment and Royal Flying Corps, son of Dr. and Mrs. J. Michell Clarke, of Clifton, Bristol, and Eileen Buchanan Njal, only daughter of Mr. and Mrs. Harold Neill, of 22, Eldon Road, Kensington.

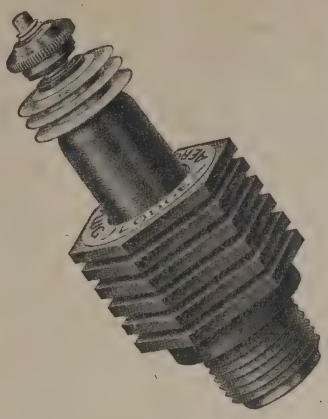
KERSHAW—FAIRCLOUGH.—A marriage has been arranged between Sec. Lt. C. D. Kershaw, of Cape-town, the Duke of Wellington's West Riding Regt. and R.F.C., and Elsie May, only daughter of Mr. and Mrs. R. A. Fairclough, of 25, Kensington Palace Gardens. The wedding will take place at St. Mary Abbot's Church, Kensington, on July 25th, at 1.30 p.m. No invitations will be sent out, but friends will be welcome at the church and afterwards at the house.

KNOTT—SULLIVAN.—A marriage has been arranged, and will shortly take place, between Mr. Ralph Knott, R.F.C., Adelphi Terrace, and Miss Josephine Sullivan, 49, Drayton Gardens, daughter of the late A. M. Sullivan and Mrs. Sullivan, of Dublin.

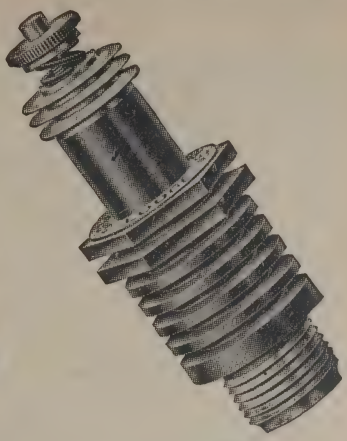
MARRIAGES.



BOURKE—ASHHURST.—On June 30th, at St. Paul's, York, Lt.-Col. U. J. D. Bourke, Oxford and Bucks Light Infantry and R.F.C., only son of Surgeon-General Sir George and Lady Bourke, was married to Irene, youngest daughter of Mr. and Mrs. Lewis Ashhurst, of Norwich.



Colonel Bourke was one of the early R.F.C. pilots of the pre-war period, and has served with distinction throughout the war. All who have served with him will wish him and his bride long life and happiness.



BROADBERRY — GRIGGS.—On the 2nd inst., at St. George's, Hanover Square, by the Rev. S. T. H. Saunders, M.A., Rector of St. Helen, Bishopsgate, Capt. Edric Broadberry, Essex Regt. and R.F.C., eldest son of Mr. and Mrs. A. F. Broadberry, of "Ellerslie," Buckhurst Hill, was married to Kathleen Mary, eldest daughter of Mr. and Mrs. S. J. Griggs, of "Dunelm," Loughton, Essex.

KIDDY—KYNOCH.—On July 4th, at St. Paul's Church, Finchley, by Rev. S. Bardswell Mayall, Maurice George Kiddy, Lieut. and Adjt., R.F.C., eldest son of Mr. and Mrs. J. G. Kiddy, of Finchley, was married to Dorothy Violet, elder daughter of Mr. and Mrs. John Kynoch, of North Finchley.

TOOMER—MOUNTJOY-SMITH.—On June 25th, at "The Holy Trinity," Bayswater, by the Rev. C. E. White, Lieut. Sydney Edward Toomer, R.F.C., second son of J. Toomer, of Swindon, was married to Poppy Adela Mountjoy-Smith, the only child of Mary and the late Samuel Mountjoy-Smith, of Cleveland Gardens, Lancaster Gate.

CLOGSTOUN.—On July 2nd, at The Moot, Downton, to Lt. H. P. S. Clogstoun, R.F.C., and Christabel Clogstoun—a daughter.

SOWREY.—On July 4th, at Quarry Down, Hythe, Audrey (née Adam), the wife of John Sowrey, Flight Commander, R.F.C., of a daughter.

In Memory:—Sec. Lt. W. F. Macdonald. Killed in action, June, 1917: From his late observer A. H. Bayes, R.F.C.

Lieut. Dermot O'Neil Driscoll, R.W.F., attd. R.F.C., has been injured in an aeroplane accident. He is the second son of Col. D. P. Driscoll, D.S.O., Royal Fusiliers.

* * *

The Rev. Herbert Stead, Warden of the Browning Settlement, Walworth Road, has received information that his son, Lt. G. C. Stead, R.F.C., is a prisoner of war, unwounded.

* * *

Lt. A. M. Sutherland, a Flying Officer, and son of the Sheriff of Newcastle, writes from Karlsruhe, stating that after his fight the German officer whom he engaged sent a message thanking him "for one of the best fights I ever had in the air."

* * *

It is reported that regimental trumpet calls have been approved for the Royal Flying Corps. Presumably the "leit-motif" will be founded on the noise made by a misfiring mono.

FRANCE.

Official Communiqués.

July 5th.—An enemy aeroplane struck by our machine-gun fire fell north-west of Moronvilliers.

July 7th.—During the period from June 21st to June 30th, 19 enemy aeroplanes and a captive balloon were brought down by our aeroplanes. In addition, 14 German machines which were seriously damaged fell into their own lines. During the bombardment operations carried out during the same period the railway stations of Récicourt (Argonne) and Avricourt (between Nancy and Strassburg) and the enemy establishments in the region of Beine (east of Reims) and of the Suippe Valley were bombed

Last night enemy aeroplanes dropped several bombs in the region of Epernay and in the region south of Nancy.

During the bombardment carried out yesterday by enemy aeroplanes in the region of Nancy several bombs fell on a hospital. Three persons were killed, including a child, and four were also wounded at Epernay.

During the night of July 6th-7th our bombarding aeroplanes carried out in particularly brilliant conditions a series of aerial expeditions. 84 machines, whose crews rivalled one another in endurance and skill, took the air in the course of these operations

Some of these raids had for their objectives towns situated far in the interior of the enemy territory in reprisal for the bombardments carried out by the Germans on our open towns. The following are the details.

Between 12.15 a.m. and 1.10 a.m. 11 of our aeroplanes flew over Trêves, on which they rained over 2½ tons of shells. Seven fires were observed in the town, one of great violence being at the central station.

About the same time six machines bombarded Ludwigshafen, causing great damage. Among others, buildings belonging to the great Badische Anilin factory were set on fire.

Another of our aeroplanes piloted by Sergeant-Major Gallois flew as far as Essen, and threw projectiles on buildings of the Krupp works. Leaving at 9.20 p.m. Sergeant-Major Gallois returned at 4.15 a.m., having travelled about 440 miles.

Military establishments in the environs of Coblentz, the station of Hirson (north-east of Laon), the railway west of Phalsburg, and the station of Thionville (north of Metz) were also bombarded.

Another series of operations took place above the enemy lines and gave excellent results. A fire broke out in the station of Dun-sur-Meuse. A munitions depot blew up at Bantheville (north-west of Verdun). The station of Machault (23 miles east-north-east of Reims) and establishments at Cauroy were set on fire.

Altogether our machines dropped 13,455 kilogrammes (about 13¼ tons of bombs). Two of our machines did not return.

Army of the Orient.—British aviators successfully bombarded the stations of Porna and Angista (20 kilometres east of Seres).

* * *

A report from Headquarters of the French Army, dated July 8th, says, apropos the bombardment of Essen by Sergeant Aviator Maxime Gallois on Friday night:—

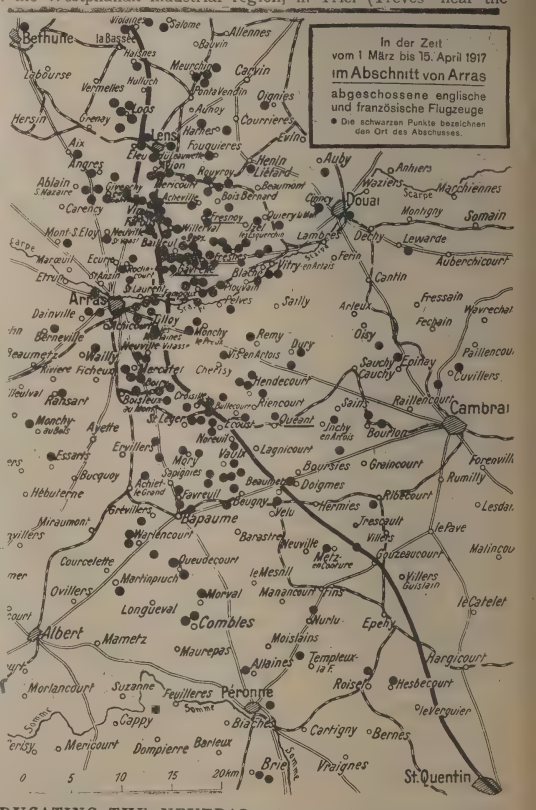
Gallois this afternoon told the story of his flight:—"We started," he said, "at 9.20 p.m. There were four of us bound for Essen, but the night was foggy, and I soon lost sight of the others. My course lay down the Moselle to Coblenz. I was fired at crossing the line by French batteries. Over Metz searchlights were playing, but I passed undetected. I continued steering by compass to Trèves, where I heard my own comrades bombing the town. Then I picked up the Rhine with the moon shining on it, and flew up-stream past Bonn and Cologne to Dusseldorf. Looking down on the German towns was like looking down on a sea of electric light. I was several times fired at by anti-aircraft guns, especially at Cologne, where the shooting was uncommonly good. Over Westphalia the blaze of light below me grew constantly brighter. As I approached Essen there was a broad band of light on the horizon, which seemed to be several miles long, while southward of the town was another great belt of light from the iron and steel foundries.

"I arrived over Essen at a height of 6,500 ft. to avoid the air defences. I chose the spot where the blaze of light from the factories seemed brightest, and there threw my cargo of bombs, counting ten between each bomb and the next. It is impossible to say what effect the bombs had among the blazing factory chimneys below. I then started homewards, returning by the route by which I had gone. I was frequently fired at, but my machine worked perfectly, and I managed to reach home just as my petrol was running out."

GERMANY.

Official Communiqués.

July 3rd.—Six enemy aeroplanes were shot down, one of them by Cavalry-Captain Baron von Richthofen.



July 5th.—Yesterday morning one of our aeroplane squadrons attacked the military establishments and coastal works near Harwich, on the east coast of England.

In spite of the strong defence from the earth and by English aerial forces we succeeded in dropping several thousands of kilograms of bombs on the objectives and in observing the good effects thereof.

All our aeroplanes have returned undamaged.

July 7th.—The aerial activity was very lively throughout the day and night. Three enemy aeroplanes and one captive balloon were brought down.

July 8th.—On the night of July 6th-7th, in addition to bomb dropping near the front, there were encounters on German territory. Enemy aviators dropped in all over 100 incendiary bombs in the Westphalian industrial region, in Trier (Treves—near the

EDUCATING THE NEUTRAL.—A map circulated in neutral countries by the German Propagandist Office, illustrating the spots at which the Germans claim to have brought down aircraft of the Allies during the fighting round Arras from March 1st to April 15th.

D. ANDERSON & SON, Ltd., Lagan Felt Works, Belfast; and Roach Road Works, Old Ford, London, E.

Luxemberg frontier) and the neighbourhood, and also on Mannheim, Ludwigshafen, and Rodalben.

There was no military damage caused. One of the enemy aeroplanes fell into our hands.

In aerial encounters and through anti-aircraft fire at the front the enemy yesterday lost nine aeroplanes. One of these was shot down by Lt. Wolff, who thereby attains his thirty-third aerial victory.

On the morning of July 7th one of our aviation squadrons attacked London. At about 11 a.m. bombs were freely dropped on the docks, harbour works, and warehouses on the Thames. Fires and explosions were observed. One of the English aeroplanes which went up in defence was shot down over London.

Also at Margate, on the east coast of England, bombs were dropped. Our aeroplanes all returned excepting one, which was compelled to make a descent in the sea, and could not be saved by our naval forces.

JULY 9th.—Enemy aviators on the night of July 6th-7th undertook numerous attacks on the German homeland. The result of the attacks, which were undertaken with strong forces, was nil, and no works of the armament industry nor any other military works were hit.

As far as could be judged from the bombs dropped and the noise of the aeroplanes, the attacks were directed upon factories at Mannheim and Ludwigshafen and in the Saar district. All the bombs were dropped in a wide circle around their presumed objectives. One or two aviators extended their voyage to the Ruhr district. Near Essen, in spite of an assiduous search during the day, only two bomb-holes were found. Six other bombs smashed some window-panes in a village 25 miles distant from Essen.

A number of enemy aviators apparently lost their way, because numerous bombs fell in districts where no objective was apparent, as, for instance, on the peaceful villages of Speicher, Ehrang, and Oberemmel, where a child fell a victim to the attack. At the town of Neunkirchen (north-east of Saarbruck), which is militarily of complete unimportance, a man was killed and a woman was severely and a child slightly wounded. In the suburb of Diedenhofen (north of Metz) a bomb killed a family of three. At Trèves the roof of the Franciscan monastery was set on fire by a bomb. Beyond that, apart from broken window-panes, nowhere was material or personal damage done.

One of the aviators who attacked Trèves was forced to the ground by our anti-aircraft guns. Near Saarburg, on the Saar, an aeroplane was smashed, one of the occupants, who was wounded, being made prisoner.

For what reason the open and from a military point of view completely unimportant town of Trèves was again bombed is incomprehensible.

* * *

A Berlin semi-official telegram (Amsterdam, July 9th) says that the German air squadron which raided London on July 7th was under the command of Captain Kleine. The telegram claims that Charing Cross Station was hit several times, and also that London Bridge was struck by a bomb.

* * *

Lieut. of the Reserve Hans Gutermuth has been killed in a fight with a Caudron biplane after 30 months' active service since August, 1914, mostly as fighting aviator. From Nuremberg is reported of Feldwebel Johann Schrott on leave there that in a fight with a French battleplane with his machine-gun he killed Lenoir, one of the French "Aces" with 16 victories over German aircraft. Further aviation casualties include Vizefeldwebel Sebastian Festner, belonging to and the first to fall of the Richthofen squadron; it was he who forced Lieut. Robinson to land on a meadow by Douai by hitting his motor over the German lines.

* * *

A report from the "Frankfurter Zeitung" says:—Before the 3,500 American machines and 6,000 aviators are ready at the front a good number of months may be expected to pass, and our German Air Service has time enough to prepare its defence against this enemy also. In material resources the Entente was already superior, but the superiority of warlike achievement in the air is nevertheless indisputably on the German side, and we are all confident that this position will not be altered by the entry of the Americans.

RUSSIA.

OFFICIAL COMMUNIQUÉS.

JULY 6th.—In the direction of Kovel, in the region of Gradiska, our artillery brought down a German aeroplane. The machine was smashed, and the aviators were killed.

In the Carpathians the German artillery brought down one of our aeroplanes, which fell in flames in the enemy's territory. The French pilot Lignaque and the observer, Lieut. Dobrinevsky, were evidently killed.

JULY 6th.—THE BALTIC.—On July 3rd nine enemy aeroplanes executed two flights over the southern extremity of the island of Oesel (north of the Gulf of Riga). Twenty-four bombs were dropped on the batteries, airsheds, and buildings. The enemy's attacks were diverted by the concentrated fire of our naval units and shore batteries, which prevented the bombs from hitting their mark. There is no loss or damage.

JULY 7th.—AVIATION.—In the direction of Balovitch, in the region south-west of Svodtitch, one of our observation balloons was set on fire by a German aeroplane. An enemy machine was brought down here by machine-gun fire. The German aviators perished. A German battleplane in the region of the village Bartonishki (on the river Berezina) brought down one of our aeroplanes. The aviators, Lieut. Trotsky and N.C.O. Savateyeff, perished.

BALTIC SEA.—On July 6th a squadron of enemy seaplanes conducted a flight in the region Tserelian, the Island of Osel, and the town of Arensburg. Nineteen bombs were dropped on the batteries, hangars, and other structures. All the bombs missed their mark and no damage was done. The enemy machines disappeared on being met by the fire of our warships and naval batteries.

BLACK SEA.—On the night of July 5th three of our fastest cutters made a raid in the Lake Razin (south of the mouth of the Danube). Having made a landing under fire, the crew captured a machine-gun and the breech of a field-gun, and took two Bulgarian soldiers prisoners, after having bayoneted twelve others. On returning the cutters were subjected to an attack by a seaplane in the Dranoff Canal.

JULY 8th.—AVIATION.—In the region of Presovce a German aeroplane was brought down.

JULY 9th.—Our aviators dropped bombs on the railway station of the town of Pinsk, causing conflagrations. A squadron of German aeroplanes made a nocturnal flight over Dvinsk and dropped a large number (several tons) of bombs.

On June 28th a German Zeppelin dropped 12 bombs on the town of Venden (on the Petrograd railway, 50 miles from Riga).

A German aeroplane dropped a note, from which it is evident that one of our machines, which was lost on June 28th, fell in the rear of the German positions, and that the dead aviators, Second Capt. Vudzilovich and N.C.O. Kalinoff, were buried by the Germans with military honours.

ITALY.

OFFICIAL COMMUNIQUÉS.

JULY 8th.—One of our big raiding squadrons, accompanied by chasing planes, went yesterday afternoon to Idria (25 miles west-north-west of Gorizia), and dropped two and a half tons of explosives on the military mercury extracting works, causing damage and fire. All our aviators returned safely.

On the Carso, during air fights, two enemy machines were brought down in our lines, while a third fell within its own lines.

JULY 9th.—ALBANIAN FRONT.—On the evening of the 7th another enemy air raid was repulsed by our fire. The numerous bombs dropped by the enemy did no damage, and there were no victims.

* * *

Details of the raid by Italian aviators at Idria on July 7th show that the mineral works there, from which the Central Empires extract all the mercury they need for explosives, were much damaged. Twelve bombers, accompanied by chasing planes, took part in the action. The central power-station and an F-shaped building to the north-east were destroyed. Several fires were observed to break out.

* * *

Reuter's Agency reports from Italian Headquarters that on July 8th three enemy aeroplanes were brought down, the first by Captain Baracca (his thirteenth), the second by Sec. Lieut. Sambonet, the third by Sergeant Rizzotto. The first of these was probably hit in its bomb magazine, for this exploded and wrecked the machine.

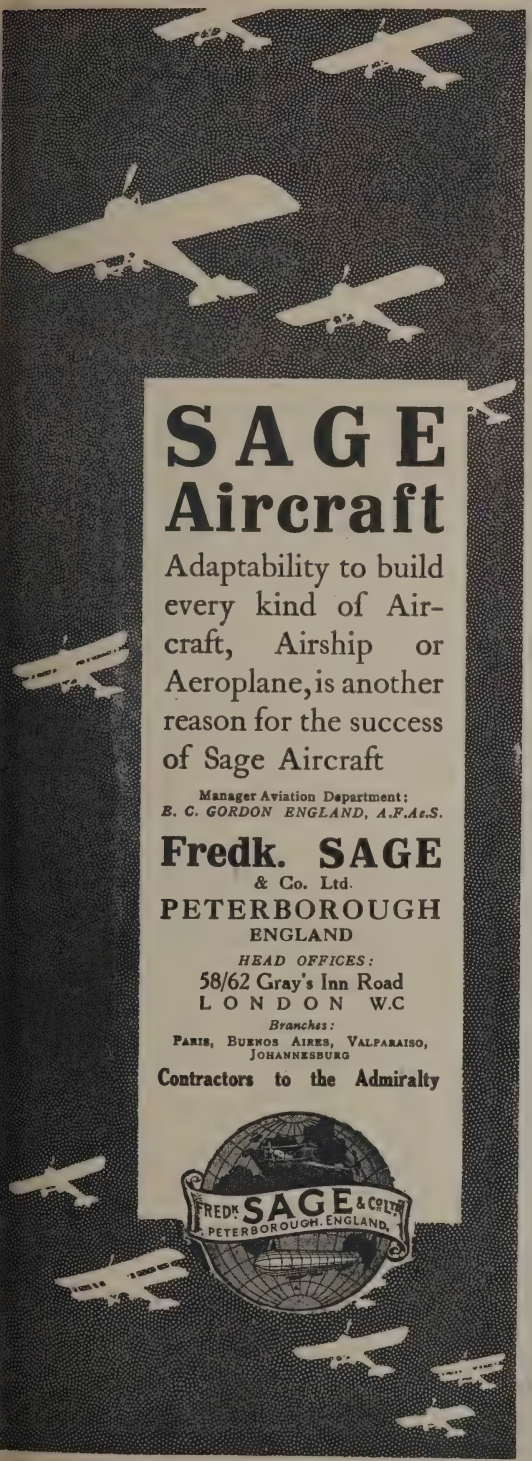
* * *

On the night of June 30th an Italian air raid was made on Trieste in reprisal for the Austrian air attack on Venice, and on Monday night an Italian seaplane dropped notices on Trieste explaining the reason of the raid.

BELGIUM.

OFFICIAL COMMUNIQUÉS.

JULY 3rd.—An enemy aeroplane was brought down by our artillery between Dixmude and Keyem.



JULY 8th.—Our aviators have displayed very great activity. On July 3rd three enemy aeroplanes were brought down, two of them by Adjutant Thieffry, in less than two minutes, thus accomplishing the first Belgian "double event." An enemy machine was also brought down by our special guns.

* * *

It is reported that on July 4th a Zeppelin and an aeroplane collided over Ghent aerodrome. The aeroplane was destroyed and fell, the two aviators being killed. The Zeppelin was damaged and one propeller was broken.

HOLLAND.

Woodfillers

BRITISH Aircraft manufacturers have up to now had to rely very largely on America to supply Woodfillers. Although the materials supplied by American firms are excellent articles in their way, it is gratifying to know that all the requirements of the industry in this direction can now be met by home manufacturers.

We manufacture Woodfillers, Dope Resisting Paints, Varnishes, Enamels, Paints (including Battleship Grey), etc., for Aeroplanes and Seaplanes, and number many of the leading aircraft manufacturers among our customers.

Enquiries will be appreciated, not only for aircraft Paints, Fillers, etc., but also for industrial Paints, Varnishes, Japanning Enamels, etc.

investigation into the question as to whether the bombs dropped at Zierikzee in April last were dropped by a British aeroplane.

The Dutch Government offered to submit bomb fragments found at Zierikzee, and asked the British Government to investigate the matter. The latter replied that it had no objection, and therefore Colonel-Lieutenant C. van Tuinen, of the General Staff, will proceed to England to attend the investigation.

The Belgian and French Governments, in reply to the question of the Dutch Government whether it was possible that the incident at Zierikzee could be attributed to a Belgian or French aeroplane, stated that a thorough investigation has shown that this was not possible.

U.S.A.

July 4th.—The War Department has transmitted the draft of the Government's Aviation Bill to the House of Representatives' Military Committee. The measure provides for the immediate construction of 22,625 aeroplanes, for which a vote of 639,000,000 dols. is asked.

* * *

It is reported that a Bill has been introduced by Mr. Dent in the House of Representatives which has for its object the formation of a corps of 75,000 trained aviators.

Another measure to be presented later will ask the House to appropriate £120,000,000 to provide sufficient machines.

[Why not make it 7,500,000 aviators while they are at it? 75,000 aviators would need at least 200,000 machines, which, at £1,000 apiece, would cost £200,000,000, so the £120,000,000 seems inadequate.—Ed.]

* * *

Brigadier-General Squier, Chief Signal Officer, together with other experts, appeared before the House of Representatives' Military Committee on July 9th to urge the speedy message of the Bill providing for the War Department's great aviation programme for the construction of 22,625 aeroplanes. General Squier explained that these would cost £72,600,000, while in addition to that sum over £40,000,000 more would be required to man the fleet and provide ammunition and supplies.

Mr. Daniels asked Congress for £9,000,000 for Navy aviation, in addition to the amount provided in the regular Naval Appropriation Bill.

* * *

It is reported from San Diego, California, that plans for an aerial fire fighting unit, believed to be the first of its kind in the world, are announced by the local fire department. It is alleged that arrangements are being made for two 100-h.p. flying boats to be in readiness to convey firemen provided with chemical extinguishers. The story is less wild than most of those about aviation produced by the American Press.

CHINA.

A report from Pekin dated July 7th says:—

The Emperor has abdicated.

At 11 o'clock this morning an aeroplane visited Pekin, flying at a great height. It dropped three bombs on the Forbidden City, killing a man and damaging some buildings near General Chang Hsun's headquarters, which were probably the objective.

General Chang Hsun, who is much depressed by the bombing of the Palace and the failure of his coup, has tendered his resignation to the Emperor. The latter is issuing an Edict announcing his abdication.

[Fairly useful bombs, those.—Ed.]

PRISONERS IN GERMANY.

As a rule, R.F.C. officers, who are prisoners in Germany, have been so well treated that the two following letters to the "Times" deserve particular attention:—

Sir,—Your readers will have noticed that a Commission is sitting in Holland, at The Hague, to deal with the different delicate questions concerning the treatment of prisoners of war. I am afraid they are not aware, however, of the scandalous treatment meted out to many of our officers and men in Germany.

It seems to me that it suffices for a German officer to write home making the slightest complaint on his treatment in England, for the German authorities to immediately seize the opportunity as a pretext to inflict what they are pleased to term "reprisals" on those of our own officers and men whom they hold as prisoners.

The eldest of my three sons, Lieutenant G. S. M. Insall, V.C., R.F.C., who has been a prisoner in Germany since December, 1915, wrote me from Crefeld on April 28th last, to say that he had just been removed to a cell, approximately 6 ft. by 9 ft. in size, with a small window fitted with an apparatus to shut out all light, but which at the time he wrote had not been brought into use. One hour's walk a day in a small yard shut in on all sides was the only exercise allowed him. He was sentenced to solitary confinement for 20 days with the door of the cell unlocked, to be followed by five months with the door kept locked. Seven other British officers were undergoing the same sentence, and my son had been instructed to tell me that this was a "re-

prisal" for supposed similar treatment to German officers in England. His letters reached me on May 29th.

The German authorities were well aware that no protest could possibly be made before these officers had undergone a considerable part of their sentence.

This is the sort of thing our Minister in Holland has to contend with, when instructed to inquire into and protest against the measures adopted by the Germans towards some of our sons who have had the misfortune to fall into their hands. Without the slightest doubt his task would be materially facilitated were he strongly backed up by public opinion. The case of my son and his seven comrades is not an isolated one.

Will not the relatives of other prisoners having cognisance of similar so-called "reprisals" join in strengthening the hands of those in charge of the interests of our officers and men in Germany, by letting it be clearly felt that the British public is wholeheartedly with them in whatever measures they may decide upon, and uninfluenced by the vapourings of those who, not having felt the sting of the war, object to reprisals?

Yours faithfully,

Gilbert J. Insall.

1, rue Blanche, square de la Trinité, Paris, June 28th.

Sir,—I have been deeply interested in a letter in your issue of the 3rd inst., from Mr. Gilbert J. Insall, in which is revealed the outrageous treatment his son, Lieutenant G. S. M. Insall, V.C., R.F.C., is receiving in Germany as reprisals. I, too, have a son, Lieutenant G. C. Formilli, R.G.A., attached R.F.C., who has been a prisoner in Germany for 18 months. Early in March this year he attempted to escape with a brother officer, Captain Somerville, of the Warwicks, but both were captured, and put into solitary confinement in cells. After remaining there five weeks my son wrote on April 10th (this letter took over six weeks reaching me) saying that he had just been informed, without any previous warning, that as there was a reprisal on he would have to do five months' solitary confinement. This applied to all English prisoners who tried to escape since February. This five months was not to count as punishment for attempted escape, but merely as a reprisal. A short time ago I received another letter from my son, dated May 8th, in which he says that he and Captain Somerville had been given on the previous day their court martial. My son was sentenced to two months' imprisonment in a fortress, and Captain Somerville to three months. This punishment is to follow on the five months' reprisals. My son very naturally asks that these matters should be looked into at home. I fear the British public is very little alive to the terrible treatment that some of the British prisoners are getting in Germany. As suggested by your correspondent, I for one should be so glad to join in any effort that could be made for strengthening the hands of those in charge of the interests of our officers and men in Germany in any measures they may decide upon. It seems to me it would be only common justice if an equal number of Hun officers in English camps should receive a similar taste of the joy of living for five consecutive months alone in a cell, approximately 6 ft. by 9 ft., as reprisals.

Yours faithfully,

A. E. Formilli.

6, Tregunter Road, The Boltons, S.W.10, July 4th.

[Certainly, this state of affairs needs investigation. It would be well if the German Government's reason for such "reprisals" were published in this country, and a denial of the said reason should be given. The fact that these officers were allowed, or encouraged, to write home about their fate, shows that Germany desires publicity to be given to the facts of the case, and it is up to the British Government to explain the circumstances, and deny the charges which have led to these "reprisals."

Curiously enough, some months ago, another officer in Germany wrote and said that he and his fellow prisoners were condemned to be closely confined in a similar manner, but that owing to the goodwill of the Governor of their Gefangenenlager they were allowed out of their cells "on leave" for 24 hours a day seven days a week. Therefore, it seems well that the whole business should be officially brought to light.—C. G. G.]

AIR RAID REPRISALS.

The following letter has been received:—

Sir,—Allow me to thank you for the article on this subject by your military contributor "Berkeley."

"Berkeley," of course, like almost all authorities on War and on International Law, condemns reprisals in general as being unjust, futile, and merely leading to greater atrocities and lasting bitterness. This opinion has been held for 2,000 years at least. I cannot see that the fact that atrocities committed from the air have been made a leading feature in the German General Staff's methods of waging war alter the general principle in any way. Of course I do not assert that all reprisals are to be condemned.

Reprisals carried out at the time on the actual infringers of war rules or later upon the real authors, the rulers, war lords, or military authorities responsible, fulfil the essential conditions which should govern reprisals. These are justice, usefulness, and a strong deterrent against a repetition of the offence.

I have, as you know, a very strong interest in our great and noble Air Service, and I hate to think of it as being employed in imitating the mean, petty, and blackguardly methods of the Germans.

There is sure to be a great outcry after this last very successful child-murder attack on East London, and I look to The Aeroplane and its Editor to stem the demand for reprisals in kind. If this demand is acceded to, we shall be doing what it is the great object in war not to do, i.e., we *shall be doing what the enemy wants us to do.*

I do not mean that the people of Germany desire to be murdered from the air. The Germans are at present in the grip of a "Frankenstein" of their own creation, and this "Frankenstein" wants at any cost to distract us from our far too successful legitimate warfare against his fighting "cannon fodder" at and behind his front.

Allow me to introduce a parable from the pages of "Punch" of many years ago. A country boy is represented as thrashing a number of goslings with a switch. On being remonstrated with, he says: "What for goschicks' feyther boit oi?"

This expresses the whole irrational stupidity of the kind of reprisals demanded.

What does "Goschicks' feyther" or Germany's "Frankenstein" care what happens to the "goschicks"? All the better if they are hurt a bit. They will attribute their woes not to the real origin, but to the immediate inflictor of the hurt.

"Berkeley" somewhat mildly, I consider, styles the murder by the German authorities of doctors and nurses on hospital ships as "an unmilitary act." This is certainly true, but the chief runners of the German war machine are not military men in the usual sense. These would probably describe themselves as "scientific men" and "philosophers."

Andrew Carnegie (whom I cannot say I much admire) is a shrewd old man, and speaking in America recently he said: "Has it not occurred to anyone that those Germans who order the cruel 'reprisals' are old, fat men sitting quietly in comfortable offices?"

A peculiarity of a "philosopher" and "scientific" (?) man of this kind is that he is able to steel his mind completely against the suffering of other people or animals. Stick even a pin into his own body, however, and his philosophy or science usually fails him completely.

A certain brilliant but shallow writer of plays and paradoxes, described by that genius for blundering phrases, Dr. Bethmann Hollweg, as "The English Poet," was recently permitted to visit the "Front." He, of course, was carefully nursed by his courteous hosts and not allowed to run into danger. He returned quite pleased with what he described as a kind of "joy-riding," made fun of the danger, inferred that the Germans were doing quite meritorious work in destroying a nation's monuments (curséd be he that removeth his neighbour's landmark).

He severely blames the people at home for exhibiting hate of "brother Boche," as he says, "The soldiers at the front do not hate, why should the non-combatants at home?"

Is he so ignorant of human nature as not to see the obvious reason? A case will show. A soldier at the front has fought the enemy straightforwardly, and does not hate him. He goes home on leave and arrives at his house to find it wrecked by a Zeppelin or aeroplane bomb, and the entrails and brains of his wife and little daughter scattered about the walls of their room. Will he not hate with an enduring hate the dastardly brutes who ordered this outrage?

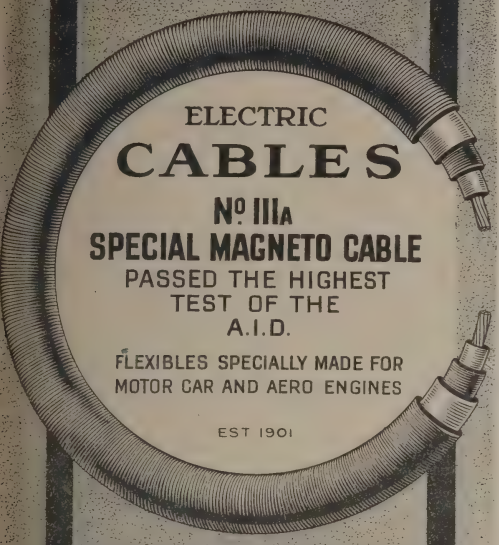
Are we then to continue to suffer these things without reply?

Would not this straightforward measure be the best calculated to bring about a speedy and a lasting peace? Let all the Entente Powers draw up an indictment of the acts of the German "Frankenstein"; print this in German, and distribute it to the German army on all fronts by aeroplanes.

The indictment would further state that the Parliament of Civilisation proclaimed the members of the German High Command as outlaws. No peace would ever be negotiated with Germany so long as these men (named) remained in power.

Germany could have peace to-morrow on just, even on generous, terms were her "Frankenstein" broken up and destroyed. A fitting punishment would be death, ignominious in the case of the non-fighters.

Failing this, the slaughter must go on until another 1,500,000 is added to the 1,500,000 of Germany's best already killed.



It would be well for Germany to consider carefully and make peace before her frontiers were crossed by the peoples she has wronged.

Meanwhile let them know that in America, Britain, France, and the others, vast new armies, munitions, and aeroplanes are being hurried forward to assist the spiritual superiority held from the first by the Allied Entente in crushing the material so long possessed by the Central Empires and their allies.

At home we can best make reprisal by pushing on with more and more aeroplanes and pilots, and harrying constantly all the German raiding nests within accessible distance of our bases.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

OUR MAN POWER.

One of the most amusing examples of our method of using our man-power came to light the other day. Three very respectable men reported for duty to a certain officer recently, in response to a request to the depôt for servants for the officers' mess. Seeing that they were above the ordinary class of servant, the officer asked them what they were before they joined.

Two said that they were chartered accountants and the other said that he was a commercial traveller.

They were taken off to the mess steward, who said to one of the accountants, "D'you know anything about silver?" "Well," replied the man, "I have collected antique silver as a hobby for some years, so I suppose I do." "Good!" said the mess steward; "then your job will be to polish the mess plate."

The notion of turning on a qualified accountant to polish forks and spoons for young officers—to some of whom he would probably have refused to pay 10s. a week as office boys before the war—is not without humour, especially when one knows the trouble certain Government offices have in keeping their books even moderately accurate and up to date owing to the shortage of trained book-keepers. Likewise the idea of a trained business man folding napkins for temporary gentlemen, who may or may not know how to use them, is quite funny when one sees the curious ideas of business methods demonstrated by some of our purchasing departments.

Really it is time a special Department was formed for the purpose of "combing out" the Navy and Army, and putting men into the jobs which they can do most efficiently. One still believes in the theory that if one does ever discover a man in the particular job for which he is most suited, one is safe to bet that he was given the job on account of some supposed qualification which he does not possess.

CAPTAIN WINDHAM REDIVIVUS.

Those who remember the merry days of the infancy of aviation, when anyone who had ever sat in an aeroplane could pose as an "expert," will be interested to learn that "Captain Windham," who ceased to be prominent in aeronautical affairs after the decease of the "Aeroplane Club," is again appearing in the public limelight—albeit suburban rather than imperial.

An article in a paper called the "Hackney Spectator" announces to the extent of two columns that "Captain Windham has accepted the invitation to become the prospective Unionist candidate for the constituency." The article relates the career of this gentleman in "the Royal Navy, Merchant Service, Royal Indian Marine, Royal Naval Light Infantry (*sic*), and as a King's Messenger," but, curiously enough, it does not say how he attained to the title of "Captain Windham, R.N."

So far as the article goes, it says that "at an early age he entered the Merchant Service." One gathers, furthermore, that he was a lieutenant in the Royal Indian Marine, which is not, strictly speaking, R.N. One understands, however, that the rank of Captain was held by Mr. Windham when serving in the Army Motor Volunteer Corps, since disbanded, but there appears to be some error in combining the rank of Captain in a disbanded volunteer corps with the rank of lieutenant in the Indian Marine, and producing "Captain, R.N.," as a result. Doubtless the editor of the "Hackney Spectator" has omitted to study the subject of Service ranks and precedence.

As regards Mr. Windham's variegated aeronautical career, the "Hackney Spectator" tells the following tale:—

"In addition to serving in the many capacities enumerated above, Captain Windham has also made a profound and successful study of several commercial and scientific problems which are to-day proving their value and merit. He was, for instance, the founder of the Aeroplane Club, an institution which had incalculable influence upon the promotion of the best interests of aviation in this country. He was the first to arrange flights to the French aerodromes, promoted exhibitions, flying competitions, and in order to encourage flying gave many prizes, including the Gold Cup, which was won by Mons. Blériot for the first cross-Channel flight. It may therefore truly be said that the prospective Unionist candidate for Central Hackney was one of the pioneers of the cordial goodwill which to-day exists between this country and our French Allies. His work on behalf of aviation extended far away beyond the confines of England and France.

"Recognising the vast potentialities of the aeroplane, he in 1910 imported the first flying machine into India. This was used under his direction for educational purposes. He also organised the flights in connection with the Government Exhibition at Allahabad, and Captain Windham was granted special permission to institute and organise the first aerial posts. His amazing daring exploits in this direction proved so highly successful that he was authorised to arrange, and was in charge of, the special series of aerial post deliveries between Hendon and Windsor in 1911.

"The world-wide interest aroused in this bold scheme will be recalled, and it is pleasing to record the fact that as a result of the deliveries a large sum of money, running into many thousands of pounds, was handed over to the King Edward Hospital Fund—the special sum of £500 being handed to the aviator, Mons. Hubert, who was injured whilst conveying the mails."

Quite apart from the fact that neither M. Blériot nor M. Hubert has taken Holy Orders, and so has not attained to the ecclesiastical title of Monseigneur, the account will be highly entertaining to all those who remember the Aeroplane Club and the Indian exhibitions, not to mention the "aerial post" business. At any rate, Mr. Windham's gift of persuasive eloquence should stand him in good stead in his political efforts.

A CHEERFUL GATHERING.

On Saturday evening the firm of William Cole and Sons, Ltd., held their annual dinner at the Pillar Hall, Victoria Station, S.W. There were present some 150 employees and guests, and the dinner was followed by a very pleasant musical evening and everyone present spent a very enjoyable time, despite—perhaps because of the air raid in the morning.

The firm of Cole is not of the mushroom type, as it existed long before the war as a motor coach building establishment as which it enjoyed a high reputation; and Mr. Cole very early in the war turned his attention to the building of aircraft, making a modest beginning in the basement of his premises at 235, Hammersmith Road. To-day the whole energies of the staff are devoted to the building of aircraft, and one sincerely hopes that the success which has attended the firm's efforts so far will continue in the future, and that eventually the firm will become as famous for the building of high class aircraft as it has been in the past as builders of high grade motor coach work.

ANOTHER EXHIBITION ACCIDENT.

During a review of babies in the People's Park, Grimsby, on July 5th, in connection with the National Baby Week, an aeroplane, which had been dropping pamphlets, alighted in a field close by, causing a crowd to assemble. A second aeroplane, which was descending, in trying to avoid the people, collided with a hedge and knocked down a woman named Simpson, seriously injuring a two-year-old child in her care.

ANSWERS TO CORRESPONDENTS.

On account of the labour involved in replying to questions from correspondents, many of which in the past have been answered over and over again by post, it has been decided to answer inquiries of general interest in the columns of THE AEROPLANE. *Inquiries should be addressed to The Editor, 166, Piccadilly, W.*

READERS BY THE HUNDRED.—If you want any information about joining the R.F.C., write to the Director-General of Military Aeronautics, The Air Board, Strand, W.C.

If you want any information about joining the R.N.A.S., write to the Director of the Air Services, The Air Board, W.C.

Men in the Army, and ratings in the Navy can only obtain commissions in their own branches or transfers to other branches by permission of their immediate commanding officers, who must forward those applications through the proper official channels.

Civilian applicants for commissions in the R.F.C enter through the Cadet Wings, and are trained to fly at the Government's expense.

Applicants for commissions in the R.N.A.S. enter as Probationary Flight Officers, and are trained at Government expense.

If you are blind or partially blind, or have to wear glasses for any serious reason, you cannot become a Naval or Military aviator.

If you have had special technical training, are over 35 years of age, and attain the necessary social standard, which is not high, you may with luck become a Stores Officer R.N.A.S., or an Equipment Officer R.F.C., even if your sight is defective and you are physically deficient in other respects.

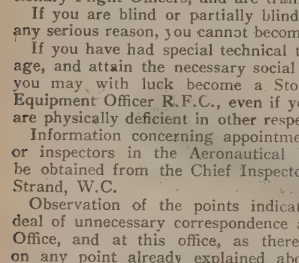
Information concerning appointments as viewers or examiners or inspectors in the Aeronautical Inspections Department may be obtained from the Chief Inspector, A.I.D., Air Board Office, Strand, W.C.

Observation of the points indicated above will save a great deal of unnecessary correspondence at the Admiralty, at the War Office, and at this office, as there is no need to write letters on any point already explained above. The Editor is always pleased to answer questions or explain any points not understood by readers, but space in THE AEROPLANE is valuable, and the same question cannot be answered over and over again week after week. Consequently readers are requested to make quite sure that their questions have not already been answered recently.

G. F. S. (Plymouth).—There is no book specially devoted to seaplanes. "The Aeroplane Speaks," by Captain H. Barber, price 7s., post free, would give you some useful general information on aviation, and it deals very soundly with the principles of flying.

P. DE R. (St. Leonards-on-Sea):—It is quite a common thing for both German and Allied aeroplanes to use machine-guns which fire through the propeller. I take it this is what you mean by firing through the fuselage. Synchronising gear is now employed to prevent the bullets striking the propeller. If you look through your back numbers and read the article about the Albatros D.I. scout, you will find they use the machine-gun in this manner, and the arrangement of the gun can be seen in the drawings. The advantage of placing the gun in this position is that it allows the pilot to aim at his adversary without altering the position of the gun, and he need only steer his aeroplane straight for the enemy. Naturally he has to turn off at the last moment.

It is difficult to name an average of normal wind velocity, but modern aeroplanes can fly in almost any wind. The presence of a powerful gusty wind only makes landing and starting more difficult.



The use of a silencer is to silence an engine. Its chief function is merely to reduce the noise. A silencer is a more or less elaborate fitting to prevent the exhaust gases from the engine impinging directly upon the open air. A properly designed silencer with a capacity of four or five times the cylinder capacity of the engine will almost completely silence the explosions. It is almost impossible, however, to silence a powerful aeroplane entirely, because the blast from the propeller makes nearly as much noise as the engine. This is a point which quite a number of people fail to realise.

The French Astra biplane figured in the French Military Trials of 1912. It was an extremely clever production for its day.

To stall a machine is to fly it in such a way that it loses its flying speed, in which event the machine is bound to fall until it picks up the original speed. Stalling is usually the result of an attempt to climb too quickly.

A spin is a phenomenon in flying where a machine is following a downward spiral course of small diameter, and where the tail is not following the same path as the nose. Experienced pilots can throw a machine into a spin and can also pull it out.

JOHN MEERLOO & SONS

CLEVELAND WORKS, CLEVELAND STREET, MILE END, LONDON, E.1.

S. G., London, N.W.10.—A useful book on propeller design has been produced by Mr. M. A. S. Riach, the price of which is 10s. 6d. Copies may be obtained from the William Dawson Publishing Co., Ltd., Rolls House, Breams Buildings, E.C.4. An article on propeller manufacture appeared in a recent issue of THE AEROPLANE.

W. E. W. (Shorncliffe).—The best books for a candidate for the R.F.C. to read are "The Aeroplane Speaks," by Captain H. Barber, price 7s., post free, and "Aeronautical Engines," by F. J. Kean, price 6s. These can be obtained from the William Dawson Publishing Co., Ltd., Rolls House, Breams Buildings, E.C.4.

J. C. L. (Winchester).—All particulars available of the Detroit Gas Turbines were published in THE AEROPLANE of June 28th, 1916. Nothing further has been heard of its performances of late, and it has come to be regarded merely as a very interesting experiment. So far as is generally known no such gas turbines are actually in use.

C. R. W. (Cheetham Hill, Manchester).—As regards the competition held in France in 1912 which was organised by the Peugeot Co. for man-driven aeroplanes, it very successfully demonstrated how very far away was everything approaching to unaided flight.

The prize was not won by Paulhan, as you suggest, but by a trick cyclist, and the "flight" so-called was nothing of the kind, the machine used being a bicycle, with a pair of wings about 18 in. long and a few inches deep, which were simply placed on the machine in order to qualify it.

As the distance to be traversed was only 1 metre, and the altitude was a few centimetres, it was quite easy for this cyclist to hurl his machine off the ground by an acrobatic contortion, which anyone who is really clever with a bicycle can perform to a greater or lesser extent.

The machine which won the prize did not even have a propeller on it, but had the usual arrangement of pedals and cranks which operate the rear wheel.

Flying has been done upon low-powered aeroplanes by several people, notably by Mr. A. V. Roe on a 10-12 h.p. biplane, by the Wright brothers on a 12-h.p. biplane, and by the late Edouard Nieuport on a 14-h.p. monoplane.

There is no doubt that low-powered aeroplanes will be tried at the cessation of hostilities for purposes of sport, but it is hardly likely to be popular, because the smaller the aeroplane the greater the risk to the pilot in the event of a smash.

L. P. C. (Felixstowe).—You are quite right in stating that there was a 14-cylinder Gnôme engine of 100 h.p. This engine was used to quite a fair extent in both land and sea-planes, some of the early Avro Admiralty machines being fitted with it. Mr. Grahame-White won the 1910 Gordon-Bennett race with a Blériot monoplane fitted with this engine.

It was practically two 50-h.p. 7-cylinder Gnômes built up together on a single crankshaft and crankcase, the cylinders being disposed in two rows of seven. The chief weakness of the engine lay in its bearings and in the impossibility of getting an even mixture to the two rows of cylinders, because if one admitted sufficient gas to reach the second row the mixture received by the rear row was much too rich, and serious overheating resulted.

E. L. (High Wycombe).—A Zeppelin was brought down near Salonika on May 5th, 1916, its number being Z.85.

ON AMERICAN OPTIMISM.

I wonder whether General Squier and Colonel Bennet, of the United States Army, are very great humorists, or whether they have been grievously misled by their technical advisers. One has heard of technical men misleading the innocent and honest soldier in the past. It happened in Mesopotamia in medical matters, and it happened in England in aeronautical affairs, so it is not beyond possibility that it has happened in the States. On the other hand, the aeronautical chiefs of the U.S. Army may be merely pulling the enemy's leg.

The reason for the uncertainty of opinion thus expressed is the official specification for "Military Pursuit Airplanes" issued from the Office of the Chief Signal Officer, War Department, Washington, D.C., on May 1st, 1917, and published in "Aviation," New York, of June 1st, 1917. Possibly this specification, known as "Aeronautical Specifications No. 1003," has now been followed by another embodying the enlightenment of a further two months. Anyhow, at this date it must be familiar to the Hun, seeing that there is no Censorship in the U.S.A., so there is no harm in publishing it and commenting on it.

But, as I have said on previous occasions, the worst fault of the Americans is that they are so damnably English, so quite possibly that specification, having once been issued, must stand for a given period. It would be quite in accordance with the best official tradition if it were decreed that, when once a specification has been issued, no alteration can be made therein for another six months. However, let us hope that such is not the case, and that General Squier and his Staff may have to-day ideas quite different from those which they held in April.

What We Expect.

Even so, it is worth while to deal with the specification at some length, because it indicates how much behind Europe America's aeronautic officials have been hitherto in their knowledge of war requirements. One would not worry about that but for the fact that we expect rather a lot from America in this war, and we expect more from her in the air than on the ground, because air fighting affords even greater scope for the peculiar initiative and individuality of the American than does infantry work.

Therefore it would be a real tragedy if the splendid human material which America can supply were to be wasted by being ineffectually equipped. We have seen during the first two years of the war considerably more than enough of mistakes in equipment in this country—especially in the Flying Services—and the best service one can do the cause of the Allies in general and America in particular is to endeavour to prevent our new Ally from making the mistakes which we have already made and put right.

Butcher's Meat.

Well do I remember, many years ago, at one of the great French trials, a group of aeronautical enthusiasts going from shed to shed inspecting and criticising the various machines. In one shed was a very fine pilot truing up a machine which looked all right to the inexperienced eye, and even to those with a fair amount of knowledge there was no obvious mistake in the design. But one sound French critic looked all over the machine carefully, then he turned to his friends, jerked his thumb over his shoulder towards the pilot, remarked in a low voice, "*Viande de la boucherie,*" and walked out of the shed. It was his only criticism of the machine, but he was right. Sure enough, within twenty-four hours the pilot was as dead as mutton.

Possibly, if his criticism had been more explicit and had been delivered to the maker of the machine, the pilot might not have flown it, and so might not have been killed. Therefore, instead of merely remarking that any pilot who crosses the German lines on an American aeroplane built to "Aeronautical Specifications No. 1003" is merely butcher's meat, it seems better to quote the whole specification and criticise it as one goes along. Here, then, is the published version, with comments interpolated paragraph by paragraph:—

AERONAUTICAL SPECIFICATIONS No. 1003.

Military Pursuit Airplanes.

This specification describes the design, construction, equipment and requirements of a military airplane adapted to overland flying, combat, and pursuit of hostile aircraft.

General Requirements.

The following characteristics shall be proven to the satisfaction of inspectors appointed by the Government for that purpose.

(1) This airplane shall be a one-place tractor, with one body and shall be equipped with one engine and one propeller.

(2) It shall be designed for carrying a useful load comprising the following:

(a) Pilot—seventy-four (74) kilograms.

(b) Available gasoline and oil sufficient for a flight of two and one-half hours at full power.

(c) Machine-gun or guns, ammunition, equipment and instruments—sixty (60) kilograms.

unless otherwise specified, during all performances and maneuvering tests, the machine-guns shall be mounted in place and the useful load carried shall be equivalent to the above enumerated.

The first point which strikes one here is that 2½ hours' supply of "gasoline"—Anglicé, petrol—is not enough. Fighting machines have frequently to escort bombing and reconnaissance machines on long journeys far behind the enemy's lines. And if, as would appear obviously to be the sanest policy, America is to build also a big fleet of large bombing machines for the invasion of Germany, then it is clear that any fighting machine should be fitted with tanks for at least four hours' flying, so that a journey of 150 miles out and

150 miles home may be covered with a fair margin of fuel for diversions from the direct route in pursuit of hostile aircraft.

Engine Power.

(3) The power plant for which the airplane shall be designed shall be an engine of type approved by this office, of between 100 and 150 actual brake horsepower.

Here is another very grave case of under-estimation. The Germans use nothing under 160 h.p. on their modern fighting machines, and their star-turn chaser pilots use anything up to 260 h.p. on single-seaters. Manufacturers are always liable to adopt the lower rather than the higher of limits officially imposed, so that the mere mention of 100 h.p. is dangerous in any specification. To talk about 100 h.p. on a war-machine to-day is as bad as talking about using 50-h.p. Gnômes on active service would have been in 1915.

It is true that quite recently it was admitted that we were then using 90-h.p. R.A.F. engines on active service, but that is merely a punishment for our past sins, and it is for America to profit by our mistakes, not to imitate them.

Under-Estimated Speed.

(4) The horizontal high speed, at an altitude of 3,000 meters above sea level, shall not be less than 165 kilometers per hour.

This, perhaps, bar one, is the most dangerous clause in the specification. Three thousand metres is, as near as no matter for practical purposes, 10,000 feet. One hundred and sixty-five kilometres per hour is just a shade over 100 miles an hour. Now, anyone who has met a German chaser of any of the later types in the 10,000 feet levels knows that he might as well get out and walk as try to fight it on a 100-mile-an-hour single-seater.

The notion of calling a 100-mile-an-hour machine a "pursuit airplane" would be distinctly humorous if it were not so tragic. "Pursued hare-plane" would be a better title for it.

As a matter of fact, if one cannot raise a speed superior to that of the German chasers, it would be better to have as a fighting machine a good, big, fat, slow thing carrying four or five machine-guns and only doing 90 miles an hour or so. Our own experience tells us that the big, slow machines afford better gun platforms than the light scouts, and that so long as a flight of half a dozen or so of them keeps its formation it can hammer its way through the German fighting machines. Even the star-turn "Circuses" never seem to stop and fight an action at close quarters with the Feeplane offensive patrols, but content themselves with making one dash and then clearing off. So the heavily armed fighter seems worth developing still further.

Anyhow, 100 miles an hour at 10,000 feet is perfectly useless for a single-seat fighter. And in making this statement I am not committing the crime of booming German aeroplanes, on which Colonel O'Gorman laid such stress in his excellent Wilbur Wright Memorial Lecture, I am merely stating a fact which is common knowledge in the Services, and ought to be known to all aeroplane designers all the world over.

I know perfectly well what are the defects of the German machines, but to point out their faults would be to assist the enemy, in that it would help him to improve his aeroplanes, whereas to emphasise the good points in the German machines is to encourage our own designers and those of the Allies to produce something better.

However, to return to the point, if General Squier obeys the traditional American injunction to "hitch his wagon to a star," he will talk to the American Aircraft Industry about 150 miles an hour at 10,000 feet, and then he may in the end obtain something worth having.

Landing.

(5) Next to extremely rapid climb, a large speed range is desirable. It shall be demonstrated by landing in a calm, that the run after touching is not more than eighty meters, and that the landing speed is not so great as to render the airplane difficult to handle.

A run of 80 metres, or 250 feet, after touching is a very liberal allowance, for any really clever test pilot, such as those who will presumably put the sample machines through their tests, ought to be able to "squat" his machine at about 40 miles an hour and pull up inside 50 yards. Naturally an unskilled pilot landing at full flying speed will run for half a mile after touching on any fast machine, but a machine doing anything between 100 and 150 miles an hour ought to be able to land at between 40 and 50 if it has the right wings.

The Worst Mistakes.

(6) The climb shall not be less than 3,000 meters in thirteen minutes.

(7) The airplane shall be capable of attaining in less than thirty minutes (starting with the specified useful load) an altitude of five thousand (5,000) meters.

Clauses (6) and (7) are by far the worst in the whole specification, simply because climbing speed and height of "ceiling" (otherwise the maximum height the machine can reach) are actually more important than anything else in a fighting machine.

As has been said over and over again, the upper berth in the air is precisely what the "weather gauge" was in fighting with sailing ships. The top dog can attack when and where he likes. He can always obtain speed by diving, and when he has dived and delivered his attack it is of prime importance that he shall be able to regain the upper berth for a fresh attack.

Now, a 10,000 ft. climb in 13 minutes is simply not worth considering in these days, even for a two-seater. For a single-seat "pursuit airplane" it is merely ridiculous. And the machine which would take half an hour to get to 16,000 feet (which is about 5,000 metres) might just as well stay on the ground for all the use it would be in pursuing a German chaser.

If General Squier will halve his times he will be somewhere near the mark. Six and a half minutes to 10,000 and 15 minutes to 16,000 would be worth considering in a fully loaded single seater, but with only 2½ hours' fuel it would be nothing very exciting even now, judging by the best German machines.

It is most important to remember the rule laid down by one of our British prophets, and quoted in this paper some six months ago: "For the officer in charge of equipment there is no to-day. His to-day is six months ahead." Six months hence 150 miles an hour at 10,000 feet, 6½ minutes to 10,000 feet, and 16,000 feet in a quarter of an hour may quite probably be out of date, and "Aeronautical Specifications No. 1003" was six months out of date when it was published on May 1st, 1917.

Getting Off.

(8) The run required, in a calm, to "unstick" for flight, shall not exceed sixty-five (65) meters.

The demand that a machine shall not run more than 65 metres (say 70 yards) before getting off the ground is merely further evidence that the art of designing a machine for climbing is not understood by our esteemed Ally. I personally have seen one of our fast chasers lift clear of the ground within 20 feet of the place on which it was resting when the engine was started. The pilot never even raised the tail; she simply trailed her tail-skid a few yards and shot straight up like a helicopter. And if single-seat fighters are to be fit to go

ap at a moment's warning and strafe unexpected enemy bombers or reconnaissance machines, that is how it has to be done.

Stunts and Controls.

(9) The airworthiness and general flying qualities of the airplane shall be satisfactory. The primary characteristic desired is celerity of response to control, in other words, extreme handiness.

In order to determine the flying qualities of the airplane, an Army pilot may, at the discretion of the inspectors, after the satisfactory completion of all required performance tests, fly the airplane to determine its general suitability for the use intended.

(10) Maneuvering ability on the ground must be satisfactory. The airplane shall be capable of making reasonably sharp turns to right and left or of being driven along a straight course in any direction with respect to a moderate wind.

(11) Control system shall be of the "stick" type. The operation of the control shall be positive, reliable, mechanically easy and shall give the proper power ratio in each case. The engine throttle shall be on the right hand side. The ground wire switch shall be on the left side.

As regards clauses (9), (10), and (11), "celerity of response to controls," otherwise the ability to "chuck stunts"—in the vernacular of the flying officer—is eminently desirable, and manœuvring ability on the ground is certainly important. It will be noted that nothing is said about inherent stability. On these points most European pilots of single-seat fighters will agree with the Specification. At the same time something might have been said on the subject of fitting an auto-lock control on the "stick" in the fashion common on the D.I. type Albatros, so that a measure of inherent longitudinal stability may be given at will, thus enabling the pilot to take both his hands off the controls when he wants them free to manipulate his machine-gun.

Armament.

(12) Satisfactory provision must be made for mounting and firing one or two machine-guns (as specified in the order). No provision for training the gun with respect to the airplane, during firing, is desirable. The proposed system of mounting the machine-guns shall be submitted to the War Department for approval before installation. The machine-gun shall be of a type specified in the order. A suitable arrangement of sights shall be installed.

Here again one feels inclined to disagree. Many pilots like to be able to train a gun when firing, especially on slow machines—among which one must class the U.S. "Military Pursuit Airplane." A fixed gun, or two fixed guns with converging fire—German fashion—firing through the propeller with a synchronising gear, is or are only of use when the "Pursuit Airplane" is so much faster than its enemy as to be able to attack when and where it wills, and to be able to avoid attack by sheer speed when it loses its chosen position.

In a slow machine, which cannot thus avoid attack, a swivelling gun for defence purposes is practically a necessity. It will be noted also that nothing is said in the specification about making allowance for synchronising gear in the design of the fuselage—but doubtless this would come under the clause (3) regarding "an engine of type approved by this office" and under clause (10) regarding a gun "of a type specified in the order."

Fuel Supplies.

(13) Gasoline feed to the carburetor shall be by gravity and shall be operative in all normal flight attitudes. It is highly desirable to avoid air pressure in a gasoline tank. In case it is necessary to pump from the main supply tank to the gravity tank, the pump shall be a suction pump. The main supply tank shall be divided into two gas tight compartments. Self sealing tanks are desirable.

The wisdom of clause (13) is obvious, but insistence on gas-tight compartments seems likely to put up weight, and self-sealing tanks—if ever some genius invents them—are likely to be heavier still.

Structural Design.

Factors of Safety.—Factors of safety will be required as follows: A. Main plane and girder structure. Stress analyses using methods and moduli approved by this office must be made for the high and low speeds of the airplane. Under the low speed condition the factor of safety shall be, at no point, less than five and one-half (5½). Under the high speed condition the factor of safety shall be, at no point, less than four and one-half (4½). Computation must be based on the total weight with loading as specified above.

Not being a scientific expert, I do not profess to be able to criticise these demands, but it seems to me that if a machine has a factor of safety of 4½ all over at its top speed, it cannot very well have a factor of safety of anything like 5½ at its low speed. Even if its top speed were as low as 120 miles an hour (to say nothing of diving all out at nearly 200 m.p.h.), and if its low speed were as absurdly high as 60 miles an hour it seems to my unscientific mind that a 4½ factor at top speed ought to give a factor somewhere up in the dozens at low speed. And, contrariwise, if it only had 5½ at low speed, its safety factor would become a minus quantity at top speed. So why bother about a low speed factor of safety. Perhaps some scientific reader will explain the error in my deductions if I am wrong. It would make an interesting and educative dissertation.

B. Body and Tail Structure.—Body structure forward of the cockpit shall be designed for a factor of safety of ten (10) over static loading conditions with the propeller axis horizontal. Load to be as stated in paragraph 2.

Body structure in the rear of the cockpit shall be designed to fail under loads not less than those imposed under the following conditions:

(a) Dynamic loading of five (5) as the result of quick turns in pulling out of a dive.

(b) Superposed on the above dynamic loading shall be the load which it is possible to impose upon the elevators, computed by the following formula: $L=(0.005)\ (A)\ (V^2)$. Where A is the total area of the stabilizing surfaces, i.e., elevators and fixed horizontal surface, and V is the horizontal high speed of the airplane. The units are kilograms, square meters, kilometers per hour.

(c) Superposed on this loading shall be the force in the control cables producing compression in the longerons.

C. Landing Gear.—The landing gear shall be designed to permit the airplane, fully loaded, to be dropped from a height of 0.25 meters on a wood floor, tires at normal inflation, without injury. The design and construction of landing gear and tail skid shall be proven satisfactory.

The body-structure stresses specified will probably take some rather nice working out, and one would like to warn American designers that in doing the calculations under sub-heads (b) and (c) they had better allow for speeds up to 200 miles an hour, because fighting pilots have a bad habit of diving with their engines full on after a descending enemy, and of doing what they call euphoniously "split-air spirals," in which gravity, full engine power, and centrifugal force are all mixed up in a hopeless tangle, which is enough to turn any slide-rule expert bald with brain-fag.

Incidentally one assumes that the adjective "split-air" originated with the idea that the speed of these manœuvres is so great that the molecules of the air hit by the machine are split into their component atoms. The phrase is not without poetic beauty of the modern kind.

Of course, there may be no need for such calculations in a slow old tank with a little 100-h.p. engine which only does 100 miles an hour, and takes half an hour to reach 16,000 feet, but it will be just as well for American designers to look ahead a bit, in case the specification is brought up to date.

Curious Omissions.

Instruments.

1 Compass—Sperry—Creagh-Osborne—Latest Navy type.

1 Aneroid 15,000 ft. Taylor Instrument Company's latest type.

1 Clock—Chelsea.
1 Rotating rolling map case.
1 Revolution indicator.
Such instruments and controls as may be necessary in connection with the power unit.

GEORGE O. SQUIER,
Brigadier-General, C.S.O.
By: JNO. B. BENNET,
Lieut.-Col., 17th Infantry.

Office of the Chief Signal Officer,
War Department,
May 1st, 1917, Washington, D.C.

The chief peculiarity about the instrument list is the entire absence of an air-speed indicator, which is the most important thing of the lot, as it is a measure of the safety of the structure of the machine in diving and an insurance against stalling when flying slowly. It is much more important that a thoroughly reliable air-speed indicator, such as the Ogilvie or Clift, be fitted than that the compass or aneroid or revolution indicator should be accurate.

One can steer by the sun; one can see one's height and estimate it nearly enough; one's stomach is a fairly accurate clock, where meal-times are concerned; and, if the machine's flying speed is right, there is proof that the engine is giving its power, no matter what the rev. indicator may say; so evidently the air-speed indicator is the most important of the lot.

BY WAY OF A JOKE.

Of course, as has been suggested, the whole specification may be only a joke, just to persuade the enemy that when the American fighting machines come over they will be "easy meat"—as a captured German pilot once remarked scornfully as he stood in a British aerodrome and looked at the comic machines which we were then using for fighters. If so, one hopes the Hun will bite it off, and will, when the time comes, meet something a good deal better than he possesses himself.

On the other hand, the specification may be only intended for intermediate machines, of the sort onto which pilots taught to fly on the excellent 90-h.p. "JN" Curtisses will be put, so as to let them get used to a little bit of speed, and to teach them to do the aforesaid "split-air stunts," before they are promoted to fly real fighting machines such as they will have to use on active service.

But the great and most important point is that American designers, and American aviators, and American people interested in aviation should not run away with the idea that "Aeronautical Specification No. 1003" is anything at all like a "Military Pursuit Airplane adapted to combat and pursuit of hostile aircraft." And it is equally important that European readers of the Specification who, lacking the American fineness of perception, might take it seriously, should not be plunged into an abyss of disappointment by the idea that, after all they have read in the American Press about America's Air Fleet, this is the kind of "air-plane" with which the U.S. Signal Corps—as the rulers of the American Aviation Service—hope to stop the war. Such a machine over the German lines would have about as much chance of getting home as the proverbial celluloid cat being chased through Hell by an asbestos dog.

AMERICA'S REAL TASK.

The following paragraph appeared recently in several British papers:—

The New York "Times" publishes a telegram from Dayton, Ohio, giving an interview with Mr. Orville Wright, who says that 10,000 aeroplanes would end the war within ten weeks. To sweep from the heavens every German aeroplane would be to put out the eyes of the German gunners.

The United States, Mr. Orville Wright declares, should begin the construction of a vast fleet of little fighting machines carrying one man and a quick-firing gun, and send them to the front within the year. The best Germany can hope to achieve as regards the production of aircraft, Mr. Wright thinks, is to keep abreast of her European antagonists, and the United States, by making use of automobile plants, is in a position to hold the balance of power in the air.

Doubtless Mr. Orville Wright, or rather Major Orville Wright—to give him his present correct title—is perfectly correct, on the assumption that America can build fighting machines capable of catching the Germans, but that capability still remains to be proved. One cannot endorse his confidence in automobile plants. With a few brilliant exceptions, our "automobile plants" in this country have been less successful as aeroplane producers, both as regards quantity and quality, than have firms who made entirely different articles before the war. Our very best aeroplanes are not made by automobile firms at all, but by pure aeroplane firms, and by people used to woodwork rather than motor work, though, be it said, the genuine engineering firms have been very successful.

Anyhow, Major Wright is wrong. America can achieve much better average results by building great big bombing machines, in which a few pounds added here and there by rough work, and in which a few pounds of long French nails used instead of carefully applied minute brads do not matter, than she can achieve by trying to build the extremely highly developed fighting machines now used in Europe, in which every ounce is scraped off with sandpaper and a smooth file.

We expect, and we shall see in time, great things from America in this war, but it is most highly to be desired that the American people shall not give way to that very English vice of undue optimism, which only leads to underestimating one's enemy, and so to utter disaster.

C. G. G.

THE AERIAL NAVIGATORS.

A book which should be in the possession of all pilots, more especially R.N.A.S. pilots, is "Air Navigation for Flight Officers," by Lieut.-Comdr. A. E. Dixie, R.N. [Published by John Hogg. Price 10s. 6d. net, or 11s., post free, from the William Dawson Publishing Co., Ltd., 2, Breams Buildings, E.C.]

The author claims that the book condenses into a small compass all the subjects in navigation which R.N.A.S. officers are required to know. There are thirteen chapters to the book, and certainly every one of them is packed with information, so one may well believe the author's claim, and even if the knowledge thus gained of so enormous a subject can only, in the nature of things, be superficial, at any rate the book provides a very sound groundwork for aviators, young or old, who have only flown by map and compass, and have not studied navigation as such.

The first five chapters are devoted to the compass and its peculiarities, starting with elementary magnetism, methods of making magnets, effects of magnets, essential features in an aeroplane compass, the adjustment of deviation, methods of swinging machines for compass adjustments, bearing tables, and so forth. The next three chapters are concerned with meteorology, and give much interesting information on cloud formations, British weather, storm signals, forecasting, and other matters. The ninth chapter is concerned with astronomy, and gives various interesting tables. The tenth and eleventh chapters deal with actual navigation, beginning with Admiralty charts, and going on through course-laying, allowing for drift, interception of the courses of hostile aircraft (a capital idea this), and how to understand lights. Chapter 12 deals with fixing positions, and Chapter 13 with the use of maps.

The book is well printed and excellently illustrated, so it is really uncommonly good value at the price apart from the fact that every cross-country aviator ought to know its contents by heart.

A CASH CONTRIBUTION.

The British Minister in Siam (states Reuter's Agency) has forwarded a further sum of £465 subscribed to the Siam British Subjects' Aeroplane Fund for the upkeep of two battleplanes, Siam No. 1 and Siam No. 2. The total sum thus subscribed in Siam is £4,965.

THE FLYING SERVICES AFTER THE WAR.

SOME POSSIBILITIES.

BY "BERKELEY."

Change in the manner of warfare has generally been a gradual process. The underlying principles do not change at all. The means of war and the weapons of war have varied and developed through the ages with slow but certain progress. Therefore the growth of the Flying Services must be considered invariably with due deference to the teachings of history.

The invention of gunpowder dates from some indeterminate period during the twelfth or thirteenth century, unless it be admitted that the inscrutable Chinese had knowledge of it in a still more remote age. Its entry into warfare was no doubt regarded by the warriors of the day as a vast revolution of method, in which civilised fighting gave way before the unholy skill of the scientist. The moment of transition could be seen, or so it seemed.

Yet generations passed before the manner of warfare underwent any radical alteration because of the new force. And to-day, when the daily news-prints tell us that the greatest brains of the country have left their counting-houses and have placed war on such a footing of intellectual skill that little remains to be learnt in the future, the development in the weapons of war still continues, apparently, with breathless rapidity, but in truth with little or no acceleration of its customary pace.

The rifle took its place in the British Army during the Peninsular War, yet over forty years later it had not been generally adopted throughout the Service. And so with each invention or improvement. Nothing comes swiftly to maturity.

Deceptive Rapidity.

To those who have watched closely the Flying Services since the days, now five years past, when they came tentatively into existence, the advance appears to have been incredibly swift. Accelerated though its progress has been by the present war, yet, when hostilities have drawn to a close military aeronautics will not yet have emerged from its earliest infancy. A hundred years hence, the progress of the past ten years will not be discernible in the general detail of history.

The Importance of Infancy.

Infancy is in all life a stage of high importance in development. All that is done during this period has a bearing on the future. Improper actions in early days reap their reward in maturity. It is easier also to affect the future efficiency of anything by the steps taken in infancy.

The war has given an unexpected opportunity to place the Flying Services of the country on a secure foundation, and to direct the future development in such a manner as will prevent the British Empire from losing its hard-gained superiority in these matters. But the times are critical, and it behoves those who speak of reform in flying matters to act warily, that mischief may be avoided.

The Popular Demand.

There is a growing demand on the part of the people for the creation of large and highly efficient aeronautical forces in the Navy and Army of the country. The nucleus already exists, but a huge expansion is needed, and the people are taking a part, because recent aerial actions of the enemy have interfered on several occasions with the amenities of life at home. But the people have only a limited objective—the defence of their homes from enemy aerial attack—and they are prone to disregard greater claims. Nevertheless, the time has come when something must be done.

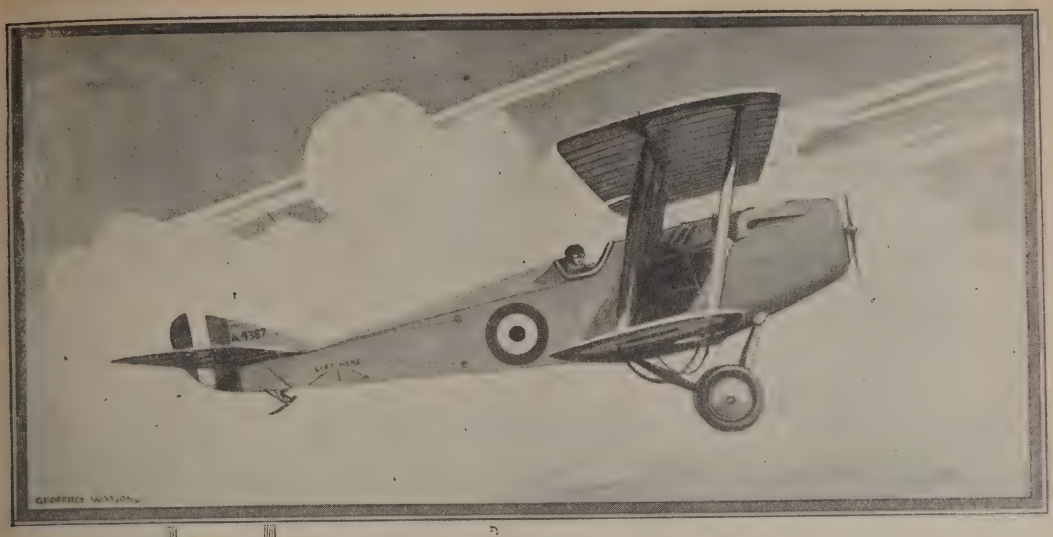
All that is done in the expansion of the existing Air Services, or in the creation of a third and separate Air Service, should be in accordance with such principles as are of application in the future, and not be merely an expedient for use in the present war. Everything that is done to-day should possess value in the days to come. It is simpler, when laying down what may well be a fundamental organisation, to proceed on correct lines than it is at a later date to alter all arrangements.

The Peerage in the Press.

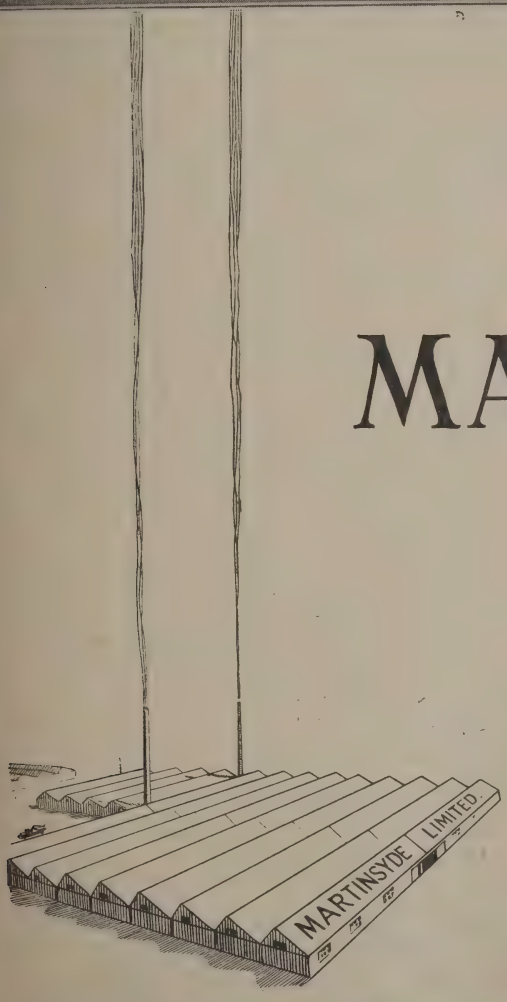
In the two leading Sunday news-prints, the "Observer" and the "Sunday Times," there are articles by the Lord Sydenham and the Lord Montagu of Beaulieu, both of whom have given deep consideration to the question of aeronautical policy. Lord Sydenham's article deals principally with the defence of England against attack by aeroplane, but it concludes with a passage stating the need for large increases both in matériel and personnel, and in an expression of opinion in favour of one single Air Service.

Lord Montagu's article, which is of considerable length, also deals with the question of aerial defence and supports those who deem that the surest method of obtaining security is to carry out a vigorous offensive against German towns. He, too, favours the formation of a separate Air Service, and speaks of 10,000 aeroplanes as a proper number to put into the field in the immediate future.

Problems of Production.



Whether the single Air Service comes into existence or not, there is no question that the time has arrived to increase our aerial resources vastly, and that the existing organisation or organisations should be revised in accordance with the lessons of the present war.



It is a very simple matter to talk of doubling output, but when the effort is made the work does not possess simplicity. There is no real shortage of material from which to manufacture the aeroplanes required, and all other machines and vehicles that are complementary, but the training of the necessary mechanics and other hands required in the enlarged works and the personnel to maintain and fly the machines produced is by no means easy.

Neither the Entente Nations nor the Central Empires can rapidly increase their aerial forces to the figures daily quoted with eloquent ease in the Press and on the platform. The advantage, it is true, is with ourselves and our Allies, in that we have a larger reserve of men on which to draw, both in the field and in the workshops. The two critics quoted above offer no solution to the difficulty. The increase can be made, but the results will not be immediate.

Pilots.

To take one class in which a change of system must be made before many months have passed by, unless the world of topsy-turvydom is to continue throughout all time—the pilot. At present, in both the Royal Naval Air Service and the Royal Flying Corps it is the rule—to which there are but few exceptions—that the pilot

SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS
S.B.A.C.

shall all be commissioned officers. In the early days of both Services half-hearted efforts were made to train non-commissioned officers and men in flying duties. The degree of success was limited, and the impression, perhaps unofficially, though it appeared to be officially held, spread that officers alone possessed the initiative necessary to make efficient aviators. A few non-commissioned officers have flown during the war, but have, as a rule, been given commissions as soon as they had proved their skill as pilots.

Officers Only.

The principle would appear to be inherently wrong. Perhaps in those days when flying was a pursuit reputed to be one of constant peril, and the officer caste of the British Army was recruited from those families who had for generations produced the professional leaders of men who created the Empire and who made the world respect the British soldier, it was proper that aeroplanes should be piloted by officers. Such officers were in effect leading. But the times have changed.

No longer are the officers of the Army drawn from a separate and gentle class. There is little essential difference between the man who leads and the man who is led in so far as birth and education are concerned. The fighting caste went as it should in the early days of the great trouble, and there are but few left to salt the Empire's forces.

The new officers have proved their worth. They have shown that they do not lack courage and that many of them have the instinct of leadership. But there is no longer any essential difference between the rank and file and the subaltern officers of the Army. The rank and file are the material from which the commissioned officer is selected. Therefore it cannot be held that any class in the Army has a monopoly of initiative or courage.

A Matter of Aptitude.

Secondly, it is no longer accepted that piloting requires any special degree of courage. Aptitude and a liking for aviation are necessary, but, then, similar attributes must be present in any occupation of an allied nature, such as, for instance, the driving of motor-cars. There is little difference in the position of the pilot and the chauffeur. Both are necessary parts of the mechanism and act under direction.

It is wasteful to employ officers, who it is to be assumed have had special training in the career of arms, as the drivers of aerial vehicles, when that work can generally be carried out as efficiently by men of lower rank. The duty of an officer is to lead. If he is to spend his time piloting aeroplanes on routine duties, he will have little time for aught else.

Observation and Leadership.

Observation, on the other hand, is highly technical in nature, and, if it is to be of value, must be carried out by personnel which has been highly trained in the art of war. There is every reason to employ officers on this work. They have, or should have, the necessary professional education.

Fighting squadrons flying into action in formation might be composed of aeroplanes piloted by non-commissioned officers or privates, and be led by an officer pilot flying a machine bearing distinctive markings. If the daily journals are to be trusted, this would appear to be an habitual practice of the Central Powers.

The use of the lower grades of the Service as pilots would reduce the number of officers necessary in proportion to the number of aeroplanes employed, and it would, in consequence, be possible to educate these officers more completely in the art of war.

(To be continued.)

The late Mr. William Iliffe.

By the death of Mr. William Iliffe, of Coventry, technical journalism loses one of its founders, and Midland England loses one of its greatest men. Starting with a printing and stationery business in Coventry, many years ago, William Iliffe first founded the "Coventry Standard," a weekly, and later produced a daily evening paper, which was a marked success. His first venture in technical journals was the "Cyclist," founded and edited by Henry Sturmey, and by far the greatest paper which ever dealt with cycling. From it sprang the "Autocar," which owes its pre-eminence to the genius of that Heaven-sent editor, H. Walter Staner, to whom I personally owe a deep debt of gratitude for his strenuous if unrequited efforts to inculcate into me the elements of orthodox editing. Also, the "Autocar" owed much to another of the old "Cyclist" staff, Harry Swindley, whose tragic fate not long ago deprived that paper of one of the most brilliant writers on motoring.

Another of William Iliffe's young men was one Alfred Harmsworth, who, after a salutary training with the firm, left to start a paper called "Answers"—the proposition being somewhat outside the scope of Mr. Iliffe's activities at the time. From "Answers" sprang later the "Daily Mail" and sundry other papers, and ultimately the Barony of Northcliffe.

With the growth of motoring and the decline of cycling as a pastime the "Cyclist" became the "Cycle and Motor Trades Review," a purely trade paper, with which I began my newspaper experiences in 1905. The growth of motor cycling as a sport led the firm, now world-famous as Iliffe & Sons, Ltd., to start the "Motor Cyclist," and the growth of industrial motors produced "Motor Traction," which gave his chance to Horace Wyatt, now secretary of the Society of British Motor Manufacturers, and one of the cleverest and wittiest of motor journalists. The "Autocar" and its latest offshoot, the "Light Car," produced F. C. Lafone, another exceptionally brilliant writer.

In 1909 the firm started the "Aero," under the joint editorship of Wilfred Aston and myself. Wilfred Aston, now a Captain A.S.C.—where he is perfectly wasted in these days when military aeronautics needs just such men as he—has positive genius with pen and pencil alike, and the "Aero" was a highly successful paper, so far as the esteem of all concerned with flying was concerned. Unfortunately, the comparative slump in flying in 1911 led the firm to turn it into a monthly magazine, and so led me to back my own opinion by starting The Aeroplane. On the "Aero," also, was Montague Tombs, now an A.I.D. officer, and a very able technical writer.

A list of all the Iliffe papers and of the men whose success in life is due to them would fill much space, but perhaps enough has been said to show the outstanding ability of the late head of the firm in judging the right moment at which to start a new paper and the right man to put in charge of it. Seldom, if ever, did he make a mistake, or have cause to regret his choice, and in Walter Staner and his son Edward Iliffe he had advisers whose judgment was of the highest value.

As an employer William Iliffe was as kindly and considerate as a man could wish, and when, as will happen in big firms, a minor employee was guilty of some

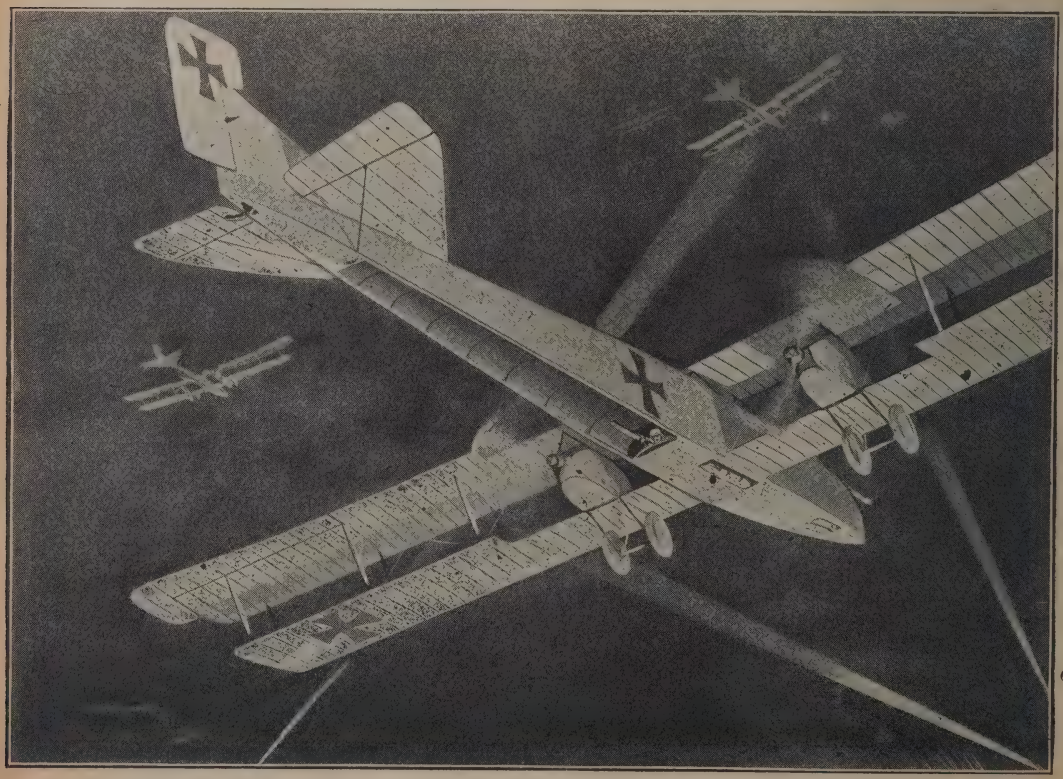
punishable offence, his kindliness generally overcame even his strict sense of justice.

He took little part in public affairs, but none the less he was very much a power in the land. There used to be told of his shrewdness in handling difficult people a delightful story which deserves to go down to posterity. Long, long ago a certain self-important, particularly provincial, and very much uneducated member of the local Corporation, or City Council, or some such body, imagined that insufficient prominence was given in Mr. Iliffe's local paper to his ungrammatical speeches, and so he proceeded to call and demand pompously that he should no longer be thus neglected. The head of the firm endeavoured to put him off politely, but apparently seeing after a while that the soft answer did not turn away wrath, Mr. Iliffe rounded on him and said, "Very well! If I have any more argument, I shall have you reported *verbatim*." The joint in the harness had been found, and that local politician gave no more trouble. I have long treasured that story as the perfect example of the complete crush.

Of late years William Iliffe had practically retired to a well-earned rest, and the great business which he founded and developed has been carried on most ably by his son Edward, who is regarded by those who know him as being pre-ordained to political eminence whenever he cares to enter the great game. The mechanical side of the business has for long been managed by his other son Coker Iliffe.

In common with so many others who owe their real start in life to the late William Iliffe, I wish to convey to his family my deep regret that he did not live many years longer to enjoy his retirement, and I tender to them my sympathy in their loss. To me his kindly manner and his sound advice on many matters great and small will always be an enduring memory.—C. G. G.

The Gotha Gun Tunnel.



So much interest has been shown in the Gotha biplane that it seems well to explain the chief reason for the difficulty found in attacking it. In all ordinary aeroplanes there is what is commonly known as a "blind spot" under the tail, which, being interpreted, means that if an attacking pilot can get just behind and below the tail-plane the after-gunner on the pursued machine cannot fire at him because of the danger of blowing his own tail to pieces, or cutting a rudder or elevator control.

The Gotha designer has overcome this difficulty by making the fuselage in the form of a bottom-less tunnel, as shown in the accompanying sketches.

The first sketch shows the view seen by a gunner firing along the top of the fuselage at a machine which has secured the "tail attack" position. The second sketch shows, more or less, the view of the same machine seen by a gunner firing along the tunnel. In the first, one perceives that the blind spot caused by the tail, effectually hides all the vital parts of the attacking machine. In the second, one sees all the vital parts exposed.

The unsuspicious pilot, who, by skilful manœuvring, has tucked himself securely under the tail to pump bullets at leisure into what he imagines to be a defenceless monster, thus offers himself as an absolute "sitter" to the machine-gun artist at the other end of the tunnel. The same gun-layer (to use the R.N.A.S. term) can also fire directly downwards and to either side, and the forward gun-layer can come aft and work the upper gun at the same time, which gun also can be fired vertically downwards over the side.

Thus, one sees how deadly to attackers a force of these machines can be, so long as their formation remains unbroken, for the only chance of any machine against them is quickness of manœuvre, and quickness of manœuvre needs room. If one single-seater attacks, it is the mark for several guns at once, not only from its

IN THE SEARCHLIGHTS: An impression of the lower stern-chaser of a Gotha Bomber, as seen from below when caught in a searchlight. The position of the gun in relation to the gun-tunnel is clearly shown.

The introduction of the gun-tunnel has removed the last "blind spot" from the Gotha three-seater. The vital parts of the attacking machine are thus exposed.

target, but from neighbouring machines as well, and if more than one attack, there is no room for manœuvre, or else each attacking machine is the mark for the guns of machines other than its intended victim.

Obviously, then, the only way to achieve results is to break up the formation, so that several small machines can attack one big one at once, and thus divide the fire of the guns. Happily, there are several methods of breaking the formation, though one must not discuss them here, because such a discussion would be of use to the enemy. If these methods are put into use promptly, instead of being pigeon-holed, as has been the case too often in the past with new ideas, we should have little more trouble with Hun raiders.

Side View of "Tail Attack," showing the lines of fire of the two gunners whose views are illustrated above.

OUR HUMOROUS POLICE.

The Commissioner of Police of the Metropolis makes this announcement:—

Whenever enemy aeroplanes are observed above the land in any part of a very considerable area of the Eastern Counties the Military give the London Authorities the warning "Take air raid action."

In view of the fact that the objective of these enemy aircraft may not be the Metropolis, but towns elsewhere situated, it has been decided not to pass on this warning to the public until there are indications that the enemy aircraft are proceeding in the direction of London and are within a certain distance of it.

In such contingency the Authorities, realising the desirability of letting the public know in time to enable them to take cover, are endeavouring to arrange for obtaining this information, so that they may transmit it to the public.

The Commissioner notifies for public information that in the event of his receiving intelligence that enemy aircraft are flying towards London, police, regular and special, will be sent out from all police stations exhibiting through the thoroughfares the following notice:—

POLICE NOTICE
TAKE COVER.

Pending some more effective measures for circulating this news, the Commissioner trusts that this emergency expedient will prove not ineffective.

[One longs to see our police-sandwich-men at work, or will the notice be carried as a kind of "Excelsior" banner?—Ed.]

THE FIRST AIR RAID WARNING.

The first official police warning of an impending air raid on London was given on July 14th, but the alarm proved to be false, and after a sojourn in various places of safety people once more emerged into the streets. At about 7.20 p.m. constables left their various stations exhibiting the official placards: "Police notice. Take cover."

Mounted on bicycles they rode through the streets, and the result of their sudden appearance was that many of the people immediately disappeared. There was a general alacrity in obeying the injunction, but theatres went on with their performances, and East London shopping centres were busy. No one was allowed to leave the cinema theatres. Some women fainted in the streets, and a doctor said "These women would probably have fainted at the sound of the first bomb, and then it would not have been easy to bring them in and to attend to them in a safe place."

A few minutes after the warning had been given, Boy Scouts on bicycles rode about shouting "All clear." Thereupon the streets filled again quickly, though none explains why the unofficial vocal Boy Scouts should have been believed as against the official and printed police.

AIR RAIDS AND THE TELEPHONE.

It is reported that the Home Office authorities have practically completed a scheme for giving public warnings of air raids, and an announcement on the subject may be expected almost immediately.

The Secretary of the General Post Office states that on the occasions of the recent air raids the transmission of official telephone messages of urgent importance has been seriously interfered with by the inconsiderate and unnecessary use of the telephone by private subscribers. The Postmaster-General earnestly appeals to the public to use the telephone as little as possible on such occasions, and on no account to call up the police or others on unimportant or merely personal matters. If this warning is not regarded it may become necessary for the Postmaster-General to curtail the telephonic facilities afforded to private persons on occasions of public emergency.

[The public telephone call offices were, apparently, cut off from use as it was, with the result that much acute anxiety was caused to perturbed wives and mothers who wished to telephone to their men-folk in the City to assure themselves of their safety. It would, of course, be difficult to differentiate between one class of call and another, but one feels that "merely personal matters" of such a nature are at least as important as a good many official calls, and far more so than ordinary commercial calls. One quite recognises the pressure of work on these occasions, but if any part of the telephone system is to be shut down to make way for official messages one suggests it should rather be the private lines than those available at other times to the public.—Ed.]

NAVAL and MILITARY AERONAUTICS

FROM THE "LONDON GAZETTE."

War Office, July 10th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld.:—Temp. Sec. Lt. P. F. Fullard, Gen. List, June 19th. Sec. Lt. G. A. Lascelles, Spec. Res., June 24th.

Park Comdr.—Lt. (temp. Capt.) F. A. G. Noel, Spec. Res., from an Equipt. Officer, 1st Cl., and to be temp. Maj. whilst so empld., June 8th.

The following references to aeroplanes are contained in a dispatch from Lt.-Gen. Sir Stanley Maude, Commander-in-Chief, Mesopotamian Expeditionary Force, describing the operations carried out by him in the period extending from August 28th, 1916, when he assumed command, until March 31st last, three weeks after the fall of Bagdad:—

Lieut.-General Marshall next took in hand the reduction of the Hai Salient, the extensive trench system which the Turks held astride the Hai River, near its junction with the Tigris. The operations lasted from January 20th to February 5th, and were successfully concluded. During this period the splendid fighting qualities of the infantry were well seconded by the bold support rendered by the artillery, and by the ceaseless work carried out by the Royal Flying Corps. These operations again resulted in heavy losses to the enemy, as testified to by the dead found, and many prisoners—besides arms, ammunition, equipment, and stores—were taken, whilst the Turks now only retained a fast vanishing hold on the right bank of the Tigris.

On March 8th a bridge was constructed across the Tigris, half a mile below Bawi, and the cavalry, followed by a portion of Lieut.-General Cobbe's force, crossed to the right bank in order to drive the enemy from positions which our aeroplanes reported that he had occupied about Shawa Khan, and north-west of that place, covering Bagdad from the south and south-west.

During the forenoon of the 9th, Shawa Khan was occupied without much opposition, and aeroplanes reported another position one and a half miles to the north-west, and some six miles south of Bagdad, as strongly held. Our attack against this developed later from the south and south-west in an endeavour to turn the enemy's right flank.

* * *

War Office, July 11th.

REGULAR FORCES.—Memorandum.—The date of seniority of Flt. Lt. C. L. E. Geach as temp. Capt. is April 1st, 1917, and not as in the "Gazette" of June 29th, 1917.

War Office, July 12th.

Establishments. — R.F.C. — Mil. Wing. — Schools of Instruction.—Schools of Mil. Aeronautics.—Instrs. (Graded as Flt. Comdrs.), and to be temp. Capts. whilst so employed:—Temp. Lt. G. H. Gordon, Gen. List, a Flying Officer, March 28th. Lt. G. G. Hubbard, Spec. Res., a Flying Officer, April 20th. (Graded as Equipment Officers, 1st Cl.).—Lt. (temp. Capt.) A. A. Nathan, Yeo. ,T.F., a Flying Officer (Observer), and to retain his temp. rank whilst so employed, May 26th. Sec. Lt. (temp. Lt.) C. R. Fleming-Williams, Spec. Res., from an Asst. Instr. (graded as an Equipment Officer, 2nd Cl.), and to be temp. Capt. whilst so employed, June 20th.

Asst. Instrs. (graded as Equipment Officers, 2nd Cl.).—Temp. Sec. Lt. R. Rainford, Gen. List, an Equipment Officer, 3rd Cl., and to be temp. Lt. whilst so employed, Feb. 27th, 1917. Temp. Sec. Lt. C. H. Collins, Gen. List, a Flying Officer, and to be temp. Lt. whilst so employed, March 28th, 1917. Sec. Lt. (temp. Lt.) L. V. Drake, Yeo., T.F., a Flying Officer, vice Sec. Lt. (temp. Lt.) A. C. Day, Spec. Res., March 31st, 1917. Temp. Lt. F. de B. Collenette, Gen. List, a Flying Officer (Observer), May 13th, 1917. May 26th, 1917: Sec. Lt. (temp. Lt.) D. Clark, R.F.A., T.F., a Flying Officer (Observer); Temp. Sec. Lt. H. Franklin, Gen. List, an Equipment Officer, 3rd Cl., and to be temp. Lt. whilst so employed.

War Office, July 13th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Sqdn. Comdr.—Lt. (temp. Capt.) A. W. H. James, M.C., Hrs., from a Flt. Comdr., and to be temp. Maj. whilst so employed, June 26th.

Flt. Comdr.—Temp. Sec. Lt. (temp. Lt.) W. J. Tempest, D.S.O., Gen. List, from a Flying Officer, and to be temp. Capt. whilst so employed, June 27th.

Balloon Co. Comdr.—Graded as a Sqdn. Comdr.—Capt. H. M. Meyler, M.C., Bord. R., from a Balloon Co. Comdr. (graded as a Flt. Comdr.), and to be temp. Maj. whilst so employed, June 16th.

Special Appt.—Sec. Lt. (temp. Lt.) A. C. Day, Spec. Res., from an Asst. Instr., R.F.C., School of Mil. Aeronautics, retains the grading of an Equipment Officer, 2nd Cl., and the temp. rank of Lt. whilst so employed, March 31st.

Temp. Lt. C. B. Baker, Oxf. and Bucks. L.I., to be an Adjt., vice Lt. G. W. Panter, R. Irish Rifles, May 21st.

Equipment Officers, 1st Cl.—Sec. Lt. (temp. Lt.) E. McEvoy, Oxf. and Bucks. L.I., from the 2nd Cl., and to be temp. Capt. whilst so employed, June 24th.

* * *

A Supplement to the "London Gazette" issued on July 13th contains a somewhat belated dispatch from Viscount Buxton, High Commissioner for South Africa, on military affairs in Rhodesia and the operations of the Rhodesian forces from the outbreak of the war to the beginning of 1916. The report is divided into five parts: (1) Operations on the West; (2) Operations on the North-Eastern Border; (3) the Tanganyika Naval Expedition; (4) the general situation in Rhodesia and the raising of forces for service in other fields than those above mentioned; (5) Conclusion.

The following passages are concerned with aircraft:—

It would have been satisfactory if the third and largest of the German ships could have been accounted for by the British flotilla, but she did not risk an engagement. After being bombed by a Belgian aeroplane, she was scuttled by the Germans in Kigoma harbour, on the eastern shore of the Lake.

So ended Germany's command of Tanganyika. Apart from the material loss inflicted on the enemy, the success of the Naval Expedition did much to enhance British prestige among the natives, not only in the immediate neighbourhood of the Lake but in the northern districts of Rhodesia and in adjacent German territory. The German supremacy of the Lake had for years been recognised as an established fact.

The following distinctions were awarded to members of the Expedition:—

Distinguished Service Medal.

Petty Officer Mechanic Chas. Ernest Cobb, R.N.A.S.

Petty Officer Mechanic Donald McLean Graham, R.N.A.S.

[One assumes that the R.N.A.S. ratings were attached to the Belgian aeroplane forces.—Ed.]

War Office, July 14th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Wing Comdr.—Capt. (temp. Maj.) A. S. Barratt, M.C., R.A., from a Sqdn. Comdr., and to be temp. Lt.-Col. whilst so empld., June 2nd, but without pay or allowances prior to June 26th.

Sqdn. Comdr.—Lt. (temp. Capt.) T. L. Mallory, Lan. Fus., Spec. Res., from a Flt. Comdr., and to be temp. Maj. whilst so empld., May 14th.

Adjts.—From Equipment Officers, 3rd Cl., June 26th.—Lt. M. Skitt, R.F.A., Spec. Res.; temp. Lt. J. Stewart, R. Sc. Fus.

Equipment Officers, 1st Cl.—Temp. Capt. W. H. Miles, Gen. List, from a Wing Instr. in Gunnery (graded as a Flt. Comdr.), and from a Flying Officer, April 18th.

SCHOOLS OF INSTRUCTION.—ARMAMENT SCHOOL.—Comdt. (graded as a Park Comdr.).—Lt. (temp. Capt.) A. C. Bishop, Yeo., T.F., from a Wing Instr. in Gunnery (graded as Equipt. Officer, 1st Cl.), and to be temp. Maj. whilst so empld., June 12th.

Instr. (graded as an Equipt. Officer, 1st Cl.)—Sec. Lt. (temp. Lt.) J. Pearce, K.O.S.B., from an Equipt. Officer, 2nd Cl., and to be temp. Capt. whilst so empld., June 12th.

NAVAL.

The following appointments have been made in the Royal Naval Air Service :—

July 10th.—Temp. commissions as Lt. (R.N.V.R.) have been granted to the following, seny. as under :—C. J. Proctor, July 6th. E. B. de Merrall, July 8th. M. D. M. Dando and C. J. Smith, July 9th.

July 13th.—A temp. commission as Lt. (R.N.V.R.) has been granted to E. H. Carmichael, seny. July 12th.

July 14th.—Flt. Comdr.—J. Bird, granted rank of Actg. Squadron Comdr., seny. July 11th.

Flt. Lt. (temp.).—W. P. Groves, granted rank of Actg. Flt. Comdr. (temp.), seny. July 11th.

ADMIRALTY COMMUNIQUÉS.

July 10th.—The Commodore, Lowestoft, reports that at 8 p.m. yesterday (July 9th), one of H.M. armed trawlers, "Iceland," Lt. P. Douglas, R.N.R., in command, destroyed two enemy seaplanes, and brought four prisoners back into port.

July 11th.—A report has been received from the Vice-Admiral, Eastern Mediterranean, that on the night of July 9th a successful attack was carried out by the Royal Naval Air Service against the Turkish-German Fleet lying off Constantinople (Golden Horn).

When the "Goeben," surrounded by warships (including submarines), had been located, the attack was made from a height of 800 ft. Direct hits were obtained on the "Goeben" and on the other enemy ships near her. Big explosions took place on board them, and several fires were observed.

The War Office was also attacked and a direct hit obtained.

The enemy appeared to have been completely surprised, as until the bombs had been dropped no anti-aircraft batteries opened fire.

Our force returned safely without any casualties.

July 11th.—Whilst on patrol on Wednesday, July 11th, a flight of five machines of the R.N.A.S. met and engaged a formation of 10 Albatros scouts and three large two-seater machines south-west of Nieuport. Three of the enemy scouts were driven down completely out of control, and two others were driven down.

One of our machines is missing.

July 12th.—The Vice-Admiral, Eastern Mediterranean, reports :—In the course of attacks on the enemy positions on the Gallipoli Peninsula, Royal Naval Air Service machines sank a tug lying off Chanak.

July 12th.—Bombing raids were carried out by the Royal Naval Air Service last night (11th-12th) on the following military objectives :—

Varssenaere (south-west of Bruges).
St. Denis Westrem (south-west of Ghent).
Ghistelles (five miles south-east of Ostend).
Ostend railway lines and electric power station.

The railway siding at Zarren (four miles east of Dixmude) was attacked by gunfire from the air, and bombs were dropped on a train near St. Denis Westrem.

A fire was caused by bombs near Ostend electric power station. A heavy explosion was also caused at Varssenaere railway dump, followed by an intense conflagration, which was still burning half an hour later. Several tons of bombs were dropped.

All machines returned safely.

July 13th.—Bombing raids were carried out by the R.N.A.S. last night (12th-13th) on the following military objectives :—

Aertrycke aerodrome (eight miles south-west of Bruges).
Houttave-Nieuwmunster aerodrome (north-west of Bruges).
Ghistelles aerodrome (south-east of Ostend).
Railway junction north of Thourout Station (about 10 miles south-south-west of Bruges).
Bruges dock and canal bank dumps.
Railway junction south of Ostend Harbour.

The visibility was generally very poor, and in consequence observation of results obtained was difficult.

A bombing attack was also made on Solway Works, Zeebrugge, and root of Zeebrugge Mole. In all several tons of bombs were dropped.

All machines returned safely.

July 16th.—During last night, July 15th-16th, several tons of bombs were dropped by the Royal Naval Air Service on the following military objectives :—

Solway Works, Zeebrugge.
Railway junctions and sidings at Ostend.
Railway sidings and dumps at Middelkerke.
Railway junction at Thourout.
Motor transport convoys and railway sidings at Lichtervelde (20 miles east of Nieuport).

All our machines returned safely.

THE CASUALTY LIST.

Reported July 11th.

MISSING.—Eyre, Flt. Lt. C. A., R.N.

PERSONAL NOTICES.

Deaths.

ALLAN.—Flt. Sub-Lt. Hugh Allan, R.N., only son of Lt.-Col. Sir Montagu Allan, C.V.O., whose death was announced last week, was educated at Lennoxville Preparatory School and Eton (where he was a member of "Pop"), and at McGill College. In September, 1915, he joined the Royal Highlanders of Canada, and during the winter of 1916 he took the machine-gun course at a Canadian School in England. In June, 1916, he transferred to the R.N.A.S., and went to the Western front last May.

EPPSTEIN.—Flt. Sub-Lt. Maurice William Wallis Eppstein, R.N.A.S., who was missing after the raid on Zeebrugge on May 12th, and is now officially reported killed, was the younger son of the Rev. W. C. Eppstein, Rector of Lambourne, Essex, and formerly headmaster of Reading School. Educated at Cheam School, the R.N.C., Osborne, and the R.N.C., Dartmouth, he at the outbreak of war was a midshipman. In September, 1916, he was gazetted to the R.N.A.S. Mr. Eppstein was 20 years of age. He was a very fine runner, and at Dartmouth was chief whip of the Britannia Beagles.

At the outbreak of the war he was a midshipman on H.M.S. "Hibernia," but in September, 1916, he entered the R.N.A.S., soon distinguishing himself as "a record pupil." He was appointed sub-lieutenant last March. His commanding officer writes:—"Your son was an exceptional officer, skilful and daring in his air work, and adding to this a power of organisation and management which made him invaluable in the routine work. There is no need for me to say anything of the personal qualities that made him such a general favourite, and the loss of which has made so great a void among even us, who are of necessity accustomed to sudden voids. . . . You may at least feel the consolation that he was lost in the execution of brave and gallant service."

KENDALL.—Flt. Sub-Lt. E. H. Kendall, R.N., who was reported missing, believed killed, when flying in action, was the younger son of E. C. Kendall, late Capt. Royal Cornwall Rangers Militia.

MORRISON.—An inquest was held at Chatham on July 14th on Flt. Sub-Lt. Donald Beckett Morrison, R.N.A.S., aged 22. The evidence showed that the late officer left an aerodrome at six in the evening for a practice flight. After being in the air twenty minutes the aeroplane made a spiral nose-dive, and fell to the ground. The body of Mr. Morrison was extricated from under the motor. Death must have been instantaneous. Mr. Morrison was described as an aviator of considerable experience. He had been at Gallipoli and in France. A verdict of accidental death was returned.

WHIGHAM.—Flt. Sub-Lt. Robert (Roy) S. Whigham, R.N., was the younger son of Mr. and Mrs. W. B. Whigham, of San Cristobal, Argentine Republic. Educated at Eastbourne and Sedbergh, he had passed the entrance examinations for Birmingham College of Engineering. He secured his commission in the R.N.A.S. in July, 1916, and was drowned on active service on May 9th last, in his 19th year.

His Commander writes:—"He was a fine boy, keen and plucky, and full of his work. He was only under my command a very short time, but during that period did extremely useful work."

Engagement.

WATKINS—ROBERTSON.—A marriage has been arranged and will take place on July 21st, at Blackheath, between Flight Lieut. S. R. Watkins, R.N., only son of Mr. F. Watkins, of Bognor, and Frances Jessie, only child of Mr. and Mrs. A. Gordon Robertson, of 29, Samon Road, Anerley, S.E.

Birth.

CHAPMAN.—On July 13th, at 89, Lancaster Gate, W., the wife of Flt. Lt. C. H. Murray Chapman, R.N., of a daughter (still-born).

The following report, supplementing the Naval communiqués of July 10th, was published in the "Times" of that date:—

The two seaplanes, carrying torpedoes, were bent on the destruction of craft in the North Sea. One of them came down and, it is said, discharged a torpedo at a passing steamer. It missed its mark, and by this time the patrol boat had come within striking distance. The seaplane, after missing her quarry, tried to rise, but there was a choppy sea on.

While she was making these efforts a well-directed shot from the patrol boat's gun smashed her, and she began to settle beneath the water, with her crew of two struggling to get free from the wreckage. The other seaplane came down to give her assistance, and she, too, was smashed by gunfire. The two men from the first were rescued by another patrol boat, and subsequently the other two were picked up.

* * *

One is under the impression that the aeroplane which bombed the "Goeben" and the Turkish War Office is that which occasioned so much sensation in Rome on arriving from London. Presently our High Authorities will begin to believe in big aeroplanes.

MILITARY.

G.H.Q. Communiqués.

July 10th, 9.45 p.m.—Bad weather again prevented aerial operations on either side yesterday.

July 11th, 10.12 p.m.—Bad weather yesterday prevented aerial activity on either side until the evening.

During the night we bombed two enemy aerodromes, all our machines returning safely.

July 12th, 9.10 p.m.—There was great activity in the air yesterday. A large number of bombs were dropped during the night on enemy aerodromes and ammunition dumps, and during the day eight other successful raids were carried out by our aeroplanes.

In the course of air fighting four German aeroplanes were brought down, and six other hostile machines were driven down out of control.

Three of our machines are missing.

July 13th, 9.15 p.m.—On the night of the 11th-12th inst. bombing operations against the enemy's railway stations, huts-ments, and aerodromes were again carried out with success. All our machines returned.

Yesterday there was unceasing aerial activity on both sides from dawn till late at night. The fighting, which resulted greatly in our favour, was the most severe that has been experienced since the commencement of the war.

Continuous engagements took place between large formations, consisting in some cases of as many as 30 machines. As a result of these encounters 14 German aeroplanes were brought down, three of which fell within our lines, and 16 other hostile machines were driven down out of control. In addition, one enemy machine was shot down by a direct hit from our anti-aircraft guns.

While our scout machines were engaged in fighting, other British aeroplanes took many photographs, and the bombing of the enemy's aerodromes, dumps, and railway stations was continued, large numbers of bombs being dropped with good results.

Nine of our machines are missing.

July 14th, 8.45 p.m.—Bombing operations by our aeroplanes were continued with success yesterday and during the preceding night. Fighting in the air took place throughout the day, in the course of which four hostile machines were brought down and 10 others were driven down out of control. Another enemy aeroplane was shot down within our lines by our anti-aircraft guns.

Seven of our machines are missing.

July 15th, 8.50 p.m.—On the night of the 13th-14th inst., four important railway stations behind the enemy's lines and a large German rest camp were bombed by our aeroplanes.

Yesterday in spite of heavy thunderstorms throughout the day, bombs were dropped on a hostile aerodrome and an enemy ammunition dump, and much valuable work was done in co-operation with our artillery.

In air fighting three German machines were brought down and two others were driven down out of control.

Five of our machines are missing.

July 16th, 8.46 p.m.—Three German aeroplanes were brought down yesterday in air fighting.

Three of our machines are missing.

War Office Communiqués.

THE ROLAND TWO-SEATER FIGHTER.

Span: 10 metres (Upper and Lower Wings equal).

Chord: 1.6 metres.

Stagger 0.6 metre.

Gap: 0.6 metre.

Motor: 175-h.p. Mercédès.

POINTS TO BE NOTED.—Equal Span Wings. Enormous single Strut on each side. Very small gap. Cut-out Upper Planes. No Dihedral or Arrow. Ear-shaped Rudder, set above line of bottom of Fuselage. Heart-shaped Tail and Elevator Unit.

The span of the lower wings is equal to that of the upper wings. They are not swept back, nor is there a dihedral.

They are extremely heavily staggered (0.6 m.), which is all the more astonishing because the wings are so close together.

The front main spar of the lower wing is in a line perpendicular to that of the upper rear spar, and the flat strut which separates them forms a species of "X," inclined towards the front.

This "X" consists of a double layer of three-ply, which, except for a slight narrowing half-way down, between the two curves, fills up all the space between the four main spars, all of which it supports, and constitutes a strut of peculiar appearance, of which the fore and aft thickness at the base and summit is half the height. It is attached to the wings by four cups and balls.

The incidence is between 3 deg. and 4 deg.

The upper wings are attached to the top of the fuselage.

The main spars are enormous, and have much hollowing out. They are 0.6 m. apart, the rear one being in the centre of the wing.

The ailerons, which do not project, are of trapezoidal form, because their pivot is not perpendicular with the axis of the machine, but very oblique. They are operated by means of vertical cranks, which, as in the Nieuport, move a horizontal shaft inside the upper wing; but on this shaft, which cannot serve as an axis for the oblique ailerons, is fixed a pulley, which operates two cables linked to the cranks of the ailerons.

The Controls.—The mobile members of the controls, both rudder and elevators, have the ear-shaped outline of the 1915 Albatros. They are of tubular construction, although the fixed tail and fin are of wood. The ensemble of the elevators is heart-shaped, that of the rudder, including the end of the fuselage, is triangular.

The Fuselage.—This is a true monocoque, of round section, and so high in form (1.5 metre) that windows are let into the flanks, for the pilot and the passenger who sit behind him. Also, an empty space has been contrived above the pilot between the two upper wings, with four curved arms, crossing one another on the axis of the machine and joining the four spars, thus making a kind of horizontal cabane for the attachment of the upper wings to the fuselage.

The Landing-Carriage.—This is of ordinary type, consisting of two "Vs" of narrow streamlined steel tube, a cross-axle and a claw brake.

The motor is a 175-h.p. Mercédès.

There is a fixed machine-gun, and a machine-gun aft on a gun-ring.

Underneath the fuselage is a bomb clip with jaw release gear, for four bombs placed longitudinally side by side.

THE AIRCRAFT WORKERS' SPORTS.

The second annual sports meeting of the aircraft workers, which is to be held at Stamford Bridge on Saturday next, July 21st, at 3 p.m., promises to be a big affair. A full list of the events was given last week, and the following further particulars are now available. A Maori lady, Princess Iwa, will sing the National Anthem and Dr. Elgar's "Land of Hope and Glory," accompanied by the band "T" Division, Metropolitan Police, to which accompaniment the song is eminently suited. Her Highness Princess Helena Victoria has kindly consented to present the prizes. The "T" Division police band will play during the afternoon.

As noted last week, the price of admission is 6d.; covered seat in grand stand, 1s. and 2s. 6d. (including tax). Further information and tickets may be obtained from the Sports Secretary, Mr. J. T. Clark, Y.M.C.A., Tottenham Court Road, W.1., the sports being held under the auspices of the Y.M.C.A.

RECREATION FOR AIRCRAFT WORKERS.

The B. and P. Sports and Recreation Club occupies a prominent place in the activities of the workers in the Boulton and Paul Aircraft Works at Norwich. But they do not confine its benefits to themselves. On Saturday, the 21st inst., the Club is holding a sports meeting in aid of the British Red Cross Society (Norwich Division), when there is to be a long programme of athletic events for men and women, in addition to items described as "Old English," such as tugs-of-war, sack race, three-legged race, and slow bicycle race. But is a bicycle "Old English"?

WALDEN-HINNERS CO. ORGANISED.

The Walden-Hinners Co., of Edgewater, N.J., has been organised to build military types of land and water aircraft. The company is now constructing machines and is installing additional equipment for quantity production.

The association of Dr. Henry W. Walden with this company will recall some interesting details connected with the developments of aeronautics in this country. Dr. Walden began his experimental work in 1908. In 1910 he and Capt. Baldwin erected aeroplane sheds at Mineola, L.I. Dr. Walden was a contestant in the international races in 1911 at Nassau Boulevard, L.I. His monoplane was equipped with a 40-h.p. Hall-Scott engine, which drove it at a speed of 63 miles per hour.

The plant and property of the Walden-Hinners Co. is situated directly across the Hudson from Grant's Tomb, with easy access to water and railroad facilities. The capital stock of the company is owned by individuals composing the Walden-Hinners Co., and none of it is for sale.

The Production of Aeroplanes and their Components

(Sixth Instalment.)

BY STEPNEY BLAKENEY.

Wing Structure.

Having dealt at some length with the construction of the fuselage and chassis, we may as well consider the construction of wings. As the machine is a biplane, there are two right-hand and two left-hand planes and one centre plane to make. For the purpose of maintaining continuous progress in construction, we may as well commence with the centre plane, as this must be fitted up before the wings can be assembled on the machine.

The first parts to produce will be the two compression struts which take the end thrust of the main upper wing or plane spars. These will be of carefully selected rift, or vertical grain, spruce of the best quality, the dimensions of each being about 3 ft. 2 in. by 3⅜ in. by 2 in., lightened out on both sides on each side of the centre for about 8 in. This will leave the strut solid in the centre for about 6 in., the lightening being 11/16 in. deep by 2⅜ in. wide, the corners having about ⅜ in. radius to prevent splitting and fracturing at the corners.

Centre Section Spars.

The most suitable timber having been selected, it will be taken to the circular saw and cut down to 3 ft. 4 in. by 3⅝ in. by 2⅛ in. It is then advisable for the works inspector to see it. Assuming that he passes it, the next thing will be to put it through the planing machine, and reduce it to the correct size plus 1/32 in. full over all to allow for shrinkage. It will then be sent to the wood setter-out, who will, after referring to the drawings, set out the four lightenings, which will have to be carved out on the spindle.

If the spindle hand does the work carefully and has his cutters properly sharpened, there will be no need to sandpaper out the lightenings when it comes from the spindle. This can be done, and is done in works where the spindle hand knows his job and is not driven at his work by someone in authority whose sole aim in life is output from the department, regardless of finish.

Such forcing the pace amounts to nothing less than scamping the work. It costs the firm pounds, and delays final production. To say the least it should be severely dealt with, after a careful inquiry has been made of the spindle speed and the state of the cutters and the material they are made of. Also sandpapered work never has the same accuracy of finish as wholly machined work.

Having received the compression struts from the spindle, the next thing to do is to find the centre of the solid part between the lightenings and then mark off the extreme ends of the struts, not forgetting the fact that an additional amount must be left on the ends of the struts to enable the ends to be accurately cut to suit the dihedral angle of the wings. This angle is the upward slant of the wings towards the tips, and may be described as the angular space included between two planes which meet each other.

Further Steps.

Having completed the machining of the struts, the wiring plates should be put in position, and the position of the bolts marked off. Then the holes should be drilled, so that when the compression ribs at each end and the intermediate ribs are in position, the wiring plates can be put on and bolted to the compression struts, and the swaged wires fixed, and the tension adjusted.

However, before this can be done, the outside box ribs or compression ribs, and the three ordinary centre ribs, must be made.

Rib Making.

To make the ribs correctly to the contour and dimensions shown on the plan, it will be best to set out one on a thin hard wood board, and then cut and finish the board accurately to the shape of the rib. After which this template can be used to set out the jig board on which the ribs will be constructed and check finished. Ribs will be described later on.

To give an idea of the shape of the ribs which will be used in the construction of the wings and centre plane, we will assume that the length from the nose or leading edge to the trailing edge is 5 ft. 6 in. Therefore set out on the hard wood board, which will be the template of the rib, a straight line 5 ft. 6 in. long. This is called the chord line. The board should be not less than, say, 6 in. wide.

Setting Out Wing Curves.

The next thing to do is to produce the correct wing curves. On referring to the drawing we find that at about 6 in. from the left-hand end of the line a vertical offset of ¼ in. is given; therefore set up a fine line at right angles to the chord line across the board, and carefully cut in a mark ¼ in. above the chord line. This represents the curved line or underside of the rib at this point. Above this dimension is another, which we will say is 3¼ in., this representing the top curved line of the rib, and as we refer to the drawing, we find that in this manner a number of points in the top and bottom curved lines of the rib are thus given on the drawing, thus enabling the rib to be set out.

When all the points have been set out on the chord line and the vertical lines set up and the two points on each vertical line marked, all we have to do is to get two pieces of thin spruce about 6 ft. long by ⅝ in. wide by 3/16 in., and tack them down to the board, so that one cuts all the points nearest the chord line, and the other the points at the top, farthest away from the chord line. The space enclosed thus is the true and required outline of the rib; that is to say, if the given offsets are correct, which they are not always.

Assuming that they are, and that the dimensions have been accurately set out, all we now have to do is to cut in a fine line with a knife, carefully following the curves of the laths nailed down, on the inside. The enclosed piece of hard wood will then be cut out on the band-saw, and we must be careful to give instructions that all the points on the top and bottom curves are to be left in, so that they can be accurately worked down by the wood template maker. This gives the template maker sufficient latitude and material to ease off or soften any angular points in the curve which may arise.

After the template has been made it should be sent to the inspection department and carefully checked and then submitted to the A.I.D.

Ribs.

After it is passed and stamped it can be returned to the wood setter-out who will mark off the spruce webs for the compression ribs of the centre planes, which can then be tacked together, four at a time, and sent to the band-saw, where they can be sawn out to within about ⅛ in. of the line. It is necessary for this amount to be left on by the band-saw, otherwise the spindle may not be able to finish them off clean.

On coming from the band-saw they will be tacked down to a template jig-board of hard wood, which is ¼ in. wide all round, to allow for the projection of the spindle-cutter, and sent to be spindled in a canner similar to the method adopted in spindling the fuselage struts.

The Rib Jig.

After being spindled the webs will be sent into the wood parts department and the jig-board obtained from the wood template maker (see Fig. 11). The jig-board consists of a piece of hard wood such as beech, oak, or ash, about 1 in. thick, about 9 in. wide, and 6 ft. long. On this will be laid a piece of selected board, planed both sides, and cut to the exact contour

of the ribs less ¼ in. on the top and bottom edges, the ¼ in. being made up by the flanges on the top and bottom of the ribs. This board, or packing as it really is, will in this case be about 1⅜ in. thick, as the web may be assumed to be about ⅜ in. thick, with lightening holes in the centre and ends. The flanges we may assume to be about 1¾ in. wide. The 1⅜ in. packing will now be carefully glued and screwed onto the centre of the 6 ft. by 9 in. board, and on the top of this two short pieces representing the section of the spars will be carefully and accurately fixed in position. These pieces of wood are for the purpose of accurately locating the position of the web on the jig and checking the holes, which are cut out to allow the spars to pass through. Having got so far it will now be necessary to fix turn-buttons to the jig-board so that when the flange is bent to the curve of the rib, preparatory to being glued and screwed to the web, it may be accurately and permanently retained in this position until the rib maker has had time to put in the screws.

The next thing to do will be to cut two No. 5/16 in. slots right through the 1⅜ in. packing on the jig-board. These two slots are the locating positions of the two small vertical stiffeners, to strengthen the web and prevent buckling under load. The slots take the vertical stiffeners and hold them in position whilst the rib is being constructed.

MAKING UP RIBS.

The rib-jig having now been constructed, the best thing to do is to make up one or two sample ribs, which must be submitted to the inspection department and if found correct sent to the A.I.D. for final inspection and approval. After which the construction of the required number can be tackled.

The method of procedure will be as follows:—Take two rib-stiffeners and place them in the slots made for them in the packing-board of the jig. Then take a web and lay it over the spar sections to locate it. After having glued the edge of the web-stiffeners next the web, fix the screws into these. Then take the top flange and slip it in between the web-edge and the turn-buttons, carefully cover with glue the edge of the web, then press the flange up to it and fix in position by turning the turn-buttons. Then with a suitable sized bradawl make the screw holes in the flange, about 4-in. pitch, and screw the screws in.

SOME POINTS TO NOTE.

Don't hammer screws in, as is done in many box and packing-case factories, for it is as well to remember that something is being made on which lives depend. Which, though it may not interest you, does interest the relatives of pilots.

Also it is best to see that the screws are put in straight, and at right-angles to the flange through which they are passing, especially if the screw selected is only just long enough for its job.

Also sharp screw-heads do not look nice when sticking up at all angles, and if you take the trouble to file them off, it, of course, weakens the heads, and possibly makes it impossible to remove the screw if it is at any time necessary.

Generally speaking, it shows that you are not up to the standard of work required in aeroplane construction.

FINISHING OFF.

Having properly put the screws in just slightly below the surface, the bottom flange may now be fixed in precisely the same manner, The rib can now be left for half an hour, if another jig is available, for the glue to set. At the end of this time the rib is ready for finishing off, sand-papering, etc.; this work, of course, being done by unskilled labour.

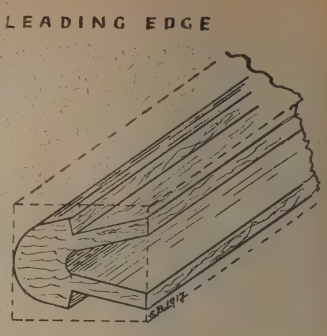

FIG. 12.

ORDINARY RIBS.

The next ribs to put in hand will be the centre ribs, three in number. These will have precisely the same contour or curves, and, therefore, the rib template will be required again. But another jig-board must be prepared. This will be done in the same way, only as the web is only 5/32 in. three-ply, and the flanges about ½ in. by 3/16 in., with a 1/16 in. groove in the centre of one side to take the 5/32 in. three-ply, the packing piece on the rib jig-board will have to be reduced in thickness. This will allow the edge of the ½ in. flange to lie level on the jig-board and will ensure the flange being central with the web. To this it will be attached with 20 gauge by ½ in. long gimp-pins, and glued. The webs will, of course, have to be carefully set out as they are lightened in the centre and have also to have the holes cut in for the spars to pass through. Otherwise these ribs will be constructed in the same way as the end ribs.

THE LEADING EDGE.

The next thing to put in hand will be the leading and trailing edges, which will be of ash, V-shaped, with a ⅜ in. radius at the small end of the V, and lightened out at the mouth of the V about ⅜ in. deep, allowing 3/16 in. thickness either side. The rectangular section of the ash required will be about 1⅜ in. by 1 in., to allow for cleaning up about 1/32 in. full and shrinkage.

The first thing to do will be to plane up a sufficient length of ash to this size and then spindle out the lightening, after which it may be cut in the spindle to its finished shape (see Fig. 12), leaving about 3 in. solid each end for additional stiffness.

(To be continued.)

THE CAMBRIDGE SCHOOL OF FLYING.

For quite a number of years the suitability of the Cambridge district as a flying centre has been mentioned from time to time, its geographical, or rather topographical, advantages being manifest. The country for many miles round is very flat, and natural facilities are offered for safe landings in every direction. It is rather strange, therefore, that the establishment of the first school of flying in the Cambridge district is of comparatively recent date, but it seems quite clear that the work of this school has received enthusiastic support.

The proprietors are the Cambridge School of Flying and Aerodrome Co., Ltd., who have acquired a fine aerodrome at Hardwick, with a surface of some 80 acres.

The school is well equipped with five Caudron type dual control aeroplanes, which are kept in good order by a staff of efficient mechanics. The works and school are under the control of Mr. Assheton Salton, formerly of the Northern Aircraft Co. of Windermere, and instruction is given by Mr. B. J. Curry, Mr. T. H. Drew, and Mr. W. S. Hardesty. Until recently the school was devoted entirely to the instruction of R.F.C. cadets, but with an increased staff and a larger number of aeroplanes available, the management are prepared to admit a number of civilian pupils for tuition. Special attention is to be given to those intending to enter the R.N.A.S. or R.F.C.

It is satisfactory to record that during the past six months no accident has occurred to any of the pupils. The aerodrome is open to inspection, and full particulars may be obtained by prospective pupils from 30b, St. Andrew's Street, Cambridge.

A NEW VENTURE.

Messrs. J. and S. Stean, of Bournemouth, an old-established firm of shop-fitters, are commencing work upon the construction of aircraft. They have taken over the entire machinery of the Worms Aircraft Construction Company of Twickenham, and have also secured the services of Mr. Max Worms, who has been responsible for the production in the past of some very fine aeroplane work. Mr. Worms will be in sole charge of the Aircraft Department, and one looks forward to the production of some very good stuff. The older firm were singularly successful in the manufacture of aeroplanes and parts, and Mr. Worms should find the high standard of workmanship to which the employees of Messrs. J. and S. Stean are accustomed a very great asset in his new work.

TECHNICALITIES.

The following notes deal with up-to-date workshop equipment, and will be followed (space and imagination permitting) by an A.B.C. version of the whole gamut of technicalities:—

Milling Machines.—These machines are chiefly used by apprentices during the period when they are cutting their technical teeth.

Planer.—As the name indicates, this is a device which elucidates the abstruse ideas of the engineers and draughtsmen, and makes them plainer.

Shaper.—This is a machine used principally in the training of apprentices.

Automatic Machines.—These are not absolutely necessary, but as girls do not masticate tobacco, a certain number of these are generally laid down, and experience shows that preference is given to those which deliver chocolates.

Slotter.—This machine is needed only in connection with the above-mentioned automatic or "Penny-in-the-Slot" machines; its use obviates the necessity of workmen carrying a large number of coins about with them.

Forge.—This is installed principally in workshops where the piecework system is the rule; its use saves the time of workmen signing tickets under this system, as this machine does it for them—hence its name.

Crankshaft.—A useful part of a machine for shops frequented by amateur inventors.

Vices.—These are common to all shops, and, therefore, need no explanatory remarks.

Benches.—These are put down for the use of tired workmen, and need not be so elaborate as those in Parks.

A Peace Time A.I.D.

By Douglas C. Hutchinson.

In the face of the Editor's mild reproof against the discussion of peace problems during war, I would strongly urge the extension of the work of the personnel of the A.I.D. to commercial uses in peace time. And as an excuse I would point out that it is easier to translate a working department from one sphere of activity to another than it is to revive one that is in a moribund condition, which might become the condition of the A.I.D. after the conclusion of the war. Also it would be very foolish to allow both the individual and collective knowledge of aircraft instruction acquired by this Department to be lost to the Aircraft Industry.

I am quite sure that though, in some cases, the inspection of material has become irksome to manufacturers, there has been a considerable amount of good done by this Department, and it is certain that they have put in hard and intelligent work, and the officials at Headquarters are to be congratulated on their efficiency.

Control and Inspection of Transport Vehicles.

I propose to deal with the subject very broadly. Looking at the question from the point of view of the general public, it is obvious inspection of machines destined for human transport is an absolute necessity. Can one imagine, for instance, the delightful state of London streets if motor omnibuses and taxis were not under stringent supervision? I believe I am quite correct in stating that there are more accidents in connection with public transit in America than in this country, which is largely due to the fact that their form of locomotion is apt to trend towards speed rather than safety. One does not quarrel for a minute with speed; the rate at which we are living at present encourages it, but there is no reason why every care should not be taken in manufacture of the means of locomotion, to eliminate as far as it is possible risks of catastrophe from faulty material.

I do not suggest that it would be practical to continue the rather far-reaching form of inspection at present in vogue, but it could be carried out somewhat on the following lines.

Companies engaged in the construction of aircraft should notify the Inspection Department—which I shall term "Aeronautical Inspection and Licensing Department," and which would be, in fact, an Aerial Board of Trade and Lloyd's Register of the Air combined—that they intend to construct aircraft for commercial purposes, and to apply for an inspector or inspectors to be stationed at their works.

They, the manufacturers, should be subjected to a charge for their licence which would, to some extent, defray the cost of inspection.

It would also be practical, I am sure, for such manufacturers to supply to this Department a list of other manufacturers from whom they propose to draw their supplies of material for the manufacture of complete machines. In each such case, of course, three or four suppliers of similar articles could be indicated, in order that the aircraft constructors should not be subjected to high prices through lack of competition. These supplies of raw materials would also be under inspection on similar lines.

Unrestricted Output.

It has been suggested to me that this inspection I propose would restrict output. I fail to see why it should, inasmuch as the inspectors would not be concerned with questions as to whether the builders of aircraft follow official specification regarding the construction or design of different components, but simply would concern themselves with the quality of the material employed.

One naturally might argue here that after all the design of the machine is the principal factor of safety. Granted; but I also propose that not only should the material be inspected, but every machine must be tested in the air by the company's own pilot before being handed over to be stamped as passed by the A.I.D., and, perhaps, to make this safeguard even more certain, someone might like to suggest, no doubt, that the designer and managing director of the company should be passengers in such flights.

It can be assumed that every manufacturer would have good stocks of various material or parts for use which the inspector would have inspected before they were actually wanted for use in the machine. He would constantly be about the works, and could very soon detect any faulty workmanship in assembling.

Licences to Build.

Another point that is of great importance from the manufacturer's point of view is that this system of applying for licences for manufacture should be of benefit to the manufacturers, inasmuch as it would eliminate jerry-builders, and I fail to see how the fact that their machines having the official approval of such a peace-time A.I.D. can be anything but an asset to the aeronautical transport companies, if only by reason of the confidence it would give to the public.

Anti-Smuggling Guarantees.

Let us take another view of the advantage that this proposed Department will be to the Aircraft Industry, or rather to that portion building machines for cross-channel purposes. One must consider the say that the Customs and Excise Department will have in this matter of aerial navigation.

Take, for instance, the zealous officer who, on arrival of the 8.45 Paris-London 1,500 h.p. Footley-Leaf—let us say—immediately commences to probe the wings, and saw through the longerons looking for smuggled saccharine, besides letting out the air from the tyres of the landing wheels and other playful tricks beloved of such officials. The activities of this gentleman will largely be toned down if the Customs Department, working in harmony with the A.I.D.—[If any two Departments can work in harmony.—Ed.]—are assured by seeing the A.I.D. official stamp on the main parts that they are what they appear to be, and are not devices for the carrying of excisable goods.

Further Duties.

The Department would compile a register of all machines British or foreign, public or pleasure, using aerodromes in this country, and unless such machines were registered in such a manner they would be, immediately on landing in this country, interned pending investigation of their bona fides, a precautionary measure on which it is hardly necessary to enlarge.

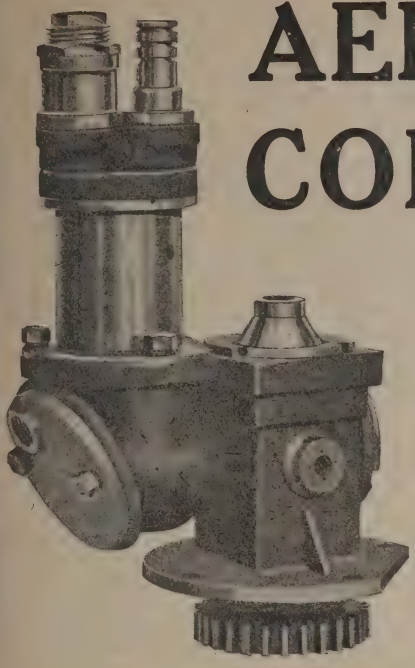
This Department might also compile, by means of advices from the Government's agents abroad, a fairly complete register of foreign machines confining their flights to their own countries or the Continent.

Again, the statistics compiled by this Department would be of inestimable value in future wars, that is, provided we live to see the end of the existing one.

Internal Reform.

Presumably, the personnel, and also the method of dealing with the inspection question, would require re-organisation and modification, but it does not seem to me to be unpractical for the Department to allow their methods to be examined by two or three business men in the aircraft trade, who would, no doubt, be able to draw up a very efficient organisation suitable for the purposes suggested in this article.

Another point that has occurred to me is that there are a considerable number of articles used in the manufacture of aircraft which need not be inspected at all, and, therefore, it will be necessary for representatives of the aircraft industry to determine for themselves, in conjunction with some chief officials of the A.I.D., which articles are most in need of inspection, that is to say, which are those more liable to develop faults that would be dangerous to passengers.



I may be quite wrong, but will take two cases only; for instance, fabric and timber. There must undoubtedly be a great risk of weakness through faulty weaving. Such weakness perhaps would not be noticeable unless it were subjected to inspection, and the effect of any such flaw would be a catastrophe in the air. Again, in the case of timber, many faults may occur without being immediately noticeable, especially in the stress of commercial building, where dividends are more to the fore than any other time.

A Disclaimer.

Probably I shall be accused of impugning the honesty of aircraft constructors by even suggesting that their work should be inspected in peace time. Of course, we all know that dividends are never dreamt of by directors of aircraft concerns, and that they are really philanthropists.

So far I have not suggested any procedure in connection with Admiralty inspection. This must be left entirely to the Admiralty, as their inspection will only be in connection with machines for fighting purposes. Fighting machines built by contractors for the War Office would be possibly dealt with by the suggested A.I.D., only with, no doubt, a more stringent form of examination than I am advocating, but the Naval or Army inspection is a question that can only be dealt with by the Military Departments, and they should have naturally first call on personnel, material, and method.

On one occasion I was accused of being like the typical man from Missouri, who must see to be convinced, and that is the reason I consider that the inspection stamp on a machine will be proof to the travelling public that it is as safe as can be. Apropos of this need for conviction, the man who accused me of coming from Missouri came to me at an hotel in New York, suggesting that as he had a very valuable idea to place, would I advance him his steamboat fare and expenses across the Atlantic. On seeing that I was rather unresponsive, he suggested then that I might at least contribute something toward it, as he had very many wealthy friends on this side who would reimburse him for his expenses. As I thought he probably would have some difficulty in even raising his car fare down to town, I then again

jibbed; then he came down to sufficient for a cable, but on my offering to send the cable off for him he hurriedly left.

THE APPLICATION THEREOF.

The question of the system is one that must be left to the chief officers of the present A.I.D. to advise upon, as they no doubt have a very effective method, and it would be probably quite easy for a small committee of inquiry to apply these methods to commercial aviation.

Perhaps I have not made this article as clear as might be possible, but I hope that I may have suggested an idea which will be advantageous to the public and the industry.

To digress from the subject a little, I should like to hear that a lecture is to be given by someone who is not perhaps an Air enthusiast, but who could put the future of aviation in a simple manner such as would be convincing to the proverbial "man-in-the-street." Public interests would be aroused where, as at present, there has been a tendency to discuss the aviatic future with a certain amount of latitude and with our rather national failing of looking broadly into matters and letting the details look after themselves.

That very excellent lecture given by Mr. Holt Thomas some few weeks ago portrayed the future very nicely, but I do not think that it would have drawn many shareholders to the fold had Mr. Thomas been considering company promoting, and although I know that Mr. Holt Thomas had no such intention, but merely to give an idea of possibilities, after all, business people must know facts.

MARKET REPORTS.

Prices given are for quantities on usual terms.

July 11th, 1917.

COPPER.—The position of the Copper market remains unaltered and there is a very marked dullness at the present time. The position in the United States is unsettled, due, primarily, to the rumour that the Federal Trade Commission intends investigating the costs of production, and fixing prices on the basis of their figures.

Supplies here are quite sufficient for national requirements:—

Current Prices.

Copper Ingot (Standard), Cash...	£130 per ton.
Copper Sheet	£165 per ton.
Copper Tube	20½d. per lb
Brass Sheet, 24 Gauge	16⅛d. per lb.
Brass Tube, S.D.	17d. per lb.

TIN.—The Tin market is still in a very erratic condition, and supplies are very uncertain. Furthermore, there is a strong opinion that America will become a large buyer.

Certain parties are endeavouring to make Tin a Government controlled metal, with the object of securing a reduction in prices. There is, however, very little possibility of their efforts meeting with success. The price advanced against last week, and under present conditions it is difficult to say what fluctuations are likely to occur.

Comparative Prices.

To-day	£246 0 0
Last week	£242 15 0
Last month	£239 10 0
Highest price last year	£205 0 0

STEEL.—The chief interest centres round the question of supplies, and, although there has recently been a hopeful feeling that the situation would become much easier, there is still an abnormal conjestion of outstanding orders. When America entered the war there were great expectations that large shipments of Billets would be received from there, but there is a general disappointment because there has been no increases whatever. U.S.A. prices still remain extremely high, in fact, they are more than double the prices charged here. As far as we can see at present, the position can only be improved by English makers effecting a colossal increase in their outputs. This is still being done, and for the present buyers are keenly alive to the present shortage of supplies, and are looking well ahead.

The Air Board are gradually taking control of all supplies of Aircraft Steels, and are organising a Clearing House in Sheffield, from which, it is presumed, supplies will be distributed. This should help matters, but it remains to be seen what the ultimate results of this step will be.

Prices have not fluctuated and the market continues firm.

Current Average Prices.

R.A.F. 3B Steel, 38s. to 40s. per cwt., Basis.
R.A.F. 1E Steel, 78s. to 80s. per cwt., Basis.
R.A.F. 9A Sheet Steel, 32s. to 33s. per cwt.

ALUMINIUM.—There has been no change whatever in prices and supplies are fairly good.

Current Official Prices.

Ingot	£225
Remelted	£210

LEAD.—The price of Lead remains unaltered, but there is a little more hopeful feeling that supplies will improve. The Spanish situation is reported to be improving, and American production is on the increase.

Official Prices for Soft Foreign Pig.

£30 10s to £29 10s.

TIMBER.—There has been very little Silver Spruce landed during the past week, and the outlook is not at all bright. A fairly good quantity of Mahogany has arrived, but not nearly as much as we should like to see.

As stated previously, the Admiralty have supplies of Silver Spruce, Mahogany and Walnut, and application for any material must be made on the official application form, which can be procured from the Department of Aeronautical Supplies, Air Board Office, Strand, W.C.2.

We understand that great stocks of Spruce are lying in Canada waiting to be shipped, and merchants fail to understand why the Government do not allow the wood to be shipped in sailing vessels, which are practically of no use whatever for Government work.

With the market in such an uncertain condition it is only natural that prices should remain firm, and there is not much hope of an improvement yet.

Current Average Prices.

Silver Spruce, 17s., c.f.
Mahogany, 2s. 2d. to 2s. 4d., s.f.
Walnut, 2s. 3d. to 2s. 6d., s.f.
English Ash, 13s. 6d. to 15s., c.f.

Prices are for selection and delivery.

FABRIC.—We fail to understand the workings of officialdom, and if other aircraft materials are not controlled better than Fabric, there will be endless confusion. Several manufacturers received a notification last week that the price of Linen Fabric would be 2s. 8d. per yard. In the first place they were not informed if the price is for 36 in. or 38 in. wide; then, again, why were they previously informed that the price would be 2s. 5d. per yard, 36 in. wide, and 2s. 7d. per yard, 38 in. wide? The material has now been under Government control about six months, and we presume they will commence charging the aircraft firms with the material already delivered when they have made up their mind what the prices will be. In the meantime supplies are coming through fairly well.

A TRIBUTE TO AN AMERICAN ENGINE.

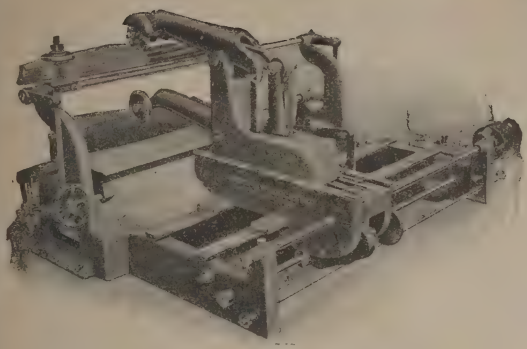
Mr. N. B. Robbins, instructor in the Army School at San Diego, Cal., states in a recent letter that the 8-cylinder, V type, "OX" Curtiss engine used by him has run officially for 127 hours without overhauling. He added that he expected to get from 150 to 175 hours' flying service out of the engine without taking it out of the machine. Mr. Robbins writes:

This engine I refer to is in machine No. 157—Curtiss JN used for training by myself. Is now in perfect working order. Turns the propeller now at 1,425 r.p.m. I believe I would be safe in saying that the average is about 1,400 for this type and size engine. Some time ago a Congressional committee visited the school and we flew in review with about 20 machines. On this trip I piloted my machine without student, and attained an altitude of 3,700 ft. in just 7 minutes, this with the engine referred to, and at that time it had run about 100 hours.

This bears out the remarks made in an editorial recently upon the dogged reliability of the Curtiss aeroplanes and engines, and also points to the low rates of climb with which American aviators are accustomed to be satisfied.

ROTAX PROGRESS.

It is of interest to note that the business of H. T. Saunders and Co., Ltd., Lozells, Birmingham, has been acquired by the Rotax Motor Accessories Co., Ltd., and will be carried on as a branch works under the name of the Rotax Brass Works, 85, Clifford Street, Lozells, Birmingham. As a matter of fact, a working arrangement has existed between the two firms for some years. All communications, however, should be sent to the head offices of the Rotax Motor Accessories Co., Ltd., at Willesden Junction, N.W.10.



DECORATIVE ART.

Officers' messes in the R.N.A.S. and R.F.C. who wish to add a little local colour to their premises by acquiring pictures of their favourite or most loathed aeroplanes would do well to communicate with Mr. Geoffrey H. Watson, an artist who is fully competent to produce in black and white or in water colours pictures of aeroplanes, which are not only technically accurate, but also on most artistic lines.

Many pictures from Mr. Watson's brush have appeared from time to time in THE AEROPLANE, but, of course, the originals are much more striking.

Upon receipt of particulars of requirements Mr. Watson will be pleased to submit estimates and to carry out commissions expeditiously. His address is 48, Longridge Road, Earl's Court.

INCREASE YOUR Propeller Output!

Automatic Propeller Shaper, K.E.

Some Advantages of our Shaper.

Every blade identical.

Less balancing required.

No scraps through careless shaping.

Work performed in a fraction of the time taken by hand.

Propeller Boring & Recessing Machine, K.A

AERO-MOTORS

IN KIND AND CONSTRUCTION

By Geoffrey de Holden-Stone

Mixed Truth.

How beautiful upon the linotypes are the hands of them that follow copy. Their faithfulness, self-restraint, and sheer instinct are wholly marvellous, and great shall be their reward—some day. I can never repay the debt I owe them. So I am not going to try. I always put that sort of thing up to the management.

Yet, sometimes I wish they wouldn't. As when, by blind perversity, I write one word and mean its exact opposite. Thus of the outer piston I wrote "in each case," whereas "each" should have been "one." Hence possible misunderstanding.

That one case is the other hidden treasure, wherein said piston is of the differential charge-pumping type. As in the Laviator and half a dozen others hereinbefore duly set forth. Also, in a later variation of the Chadderton design, and another in projection. So as this is the best way to turn the otherwise useless end of a piston to frictional account in the two-stroke cycle—and in the ideal fashion of adding no new part—I might well write "naturally."

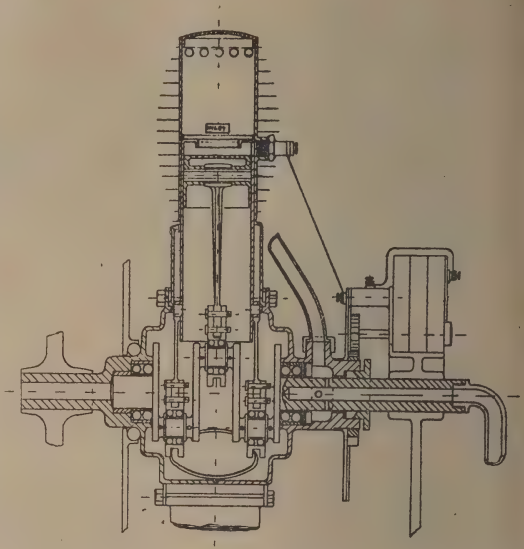
But it does not happen to be so in the original Chadderton model now under review. I should imagine that a sound opportunity had been missed here. Still, my own predilections might well lead me wrong, nevertheless. For, in the first place, deference to the side elevation will show that the lower cylinder enlargement is merely a sort of cross-head slide. Secondly, the special Chadderton cycle ordains otherwise, for the time being.

The particular principle of this cycle it will be remembered, is that not only shall there be no explosive mixture in the crank-chamber, but that none shall reach the combustion space between the pistons before the moment of combustion: that moment, of course, being reckoned with due allowance for the advance or delay of the actual ignition.

The Chadderton Induction.

How this is done will be seen—albeit not too clearly—from the sectional illustration on this page. This shows that the air for the mixture is first drawn through the front end of the crank-shaft into the crank-chamber, by the suction of the under side of the inner piston. As, for instance, in the Day or Smalley-type two-stroke cycle. Then that, during the piston outstroke, the air is compressed—internally of the motor—into some sort of pressure tank or container. Though how, or by what exit or other means is neither illustrated nor explained, and I am no good at riddles. The stated pressure, at any rate, is some 75 lbs.: which, incidentally, is also employed for starting.

But accepting the evidence of things not seen, it will, nevertheless, be clear from the illustration that the compressed air can come back as stated, through the special carburettor employed—also not shown—by way of the tubular axle on which the motor rotates. Also that it passes through certain perforations into an annular distributing chamber, and thence is delivered through induction piping to the main inlet passage of each cylinder by way of an a.o. non-return valve.



Certain Mechanical Defects.

Here, if one may criticise frankly, the latter mechanical part of this induction scheme is not promising. In fact, it is wholly at variance with the soundest experience of two-stroke practice—to say nothing of its ideals—which has long ago proved a.o. poppet valves to be deadly things. The mere fact that they must act twice as fast as in four-stroke practice—where they were bad enough—disqualifies them. So much so, that their least failure—which may be perpetually expected—suffices to put the running of the motor all wrong.

Yet, in the later variation of this design, actually two of them are embodied! Beside this, that acute-angled bend in the head of the induction piping, appears but a minor defect. Indeed, were it not for the originality and unusual merit of the design in other and more fundamental respects, and the possibilities of eliminating these valves altogether, which may be discerned, one would almost condemn it on their account. Truly, their notorious unreliability would counteract all the safety intended to be assured by the special principle of the Chadderton cycle. After all, if a motor is likely to quit working at any moment through valve-failure, the merit of its immunity from taking fire would almost be lost sight of.

And Physical Possibilities.

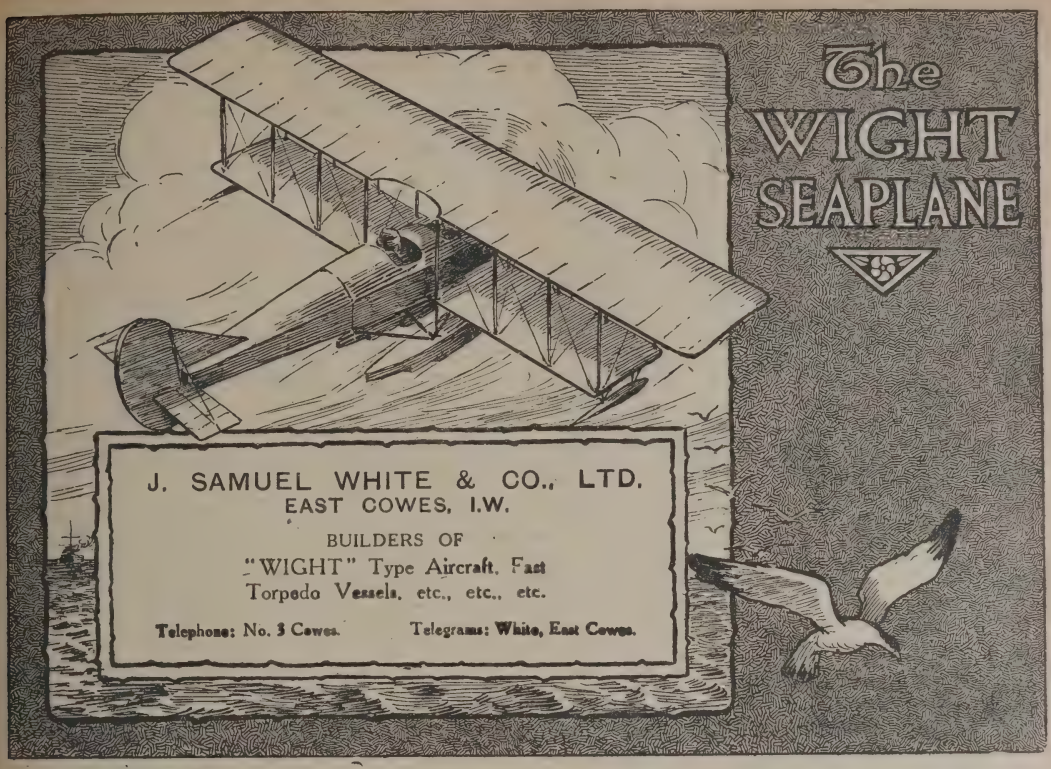
On the other hand, on this account alone, the Chadderton induction principle should be of extraordinary value. Subject, of course, to the novel carburation methods it involves, proving

Section through Shaft of the Chadderton Two-stroke Rotary Motor.

reliable—for which reason exhibition of the carburettor design, so far withheld, would be interesting—and to the charging of the cylinder being duly effected as claimed.

However—even though taking nothing for granted—there seems little reason to doubt the latter result. The pressure—which could hardly fall much below 65 lbs. between container and cylinder—should be more than sufficient for forced induction, as well as to operate the annular two-way valve as effectively as it has been claimed to do, and to charge the cylinder with all the essential rapidity. Also, the fact that this valve remains open, providing the exhaust-gas relief to atmospheric pressure, during the entire instroke of the outer piston, should materially assist this result. And finally, there appears to be nothing mechanical or physical, to prevent this induction system being applied to any type of motor radial, vertical, or V, otherwise embodying the Chadderton design and general features.

Nevertheless, the existence of such a pressure as a fundamental feature of its working, furnishes a conclusive argument, not only for valvelessness, but also for the elimination, as far as possible, of piping and possible leakage points; in fact, for the embodiment of all induction conduits within mass-parts, instead of externally.



How the Valve Works.

Coming now to the question of how the channel-shaped, pressure actuated dual valve works, the question of the relative position of the two port-series has only been dealt with to the extent of stating the desirable remoteness of initial entry from final exhaust. The rest of it is not so much whether the valve would work with the position reversed, as how it works as it is.

As shown, this valve is at the end of the exhaust period; that is, the instroke. Now it is just in this respect that one of the chief differences between the Chadderton cycle and other two-strokers—even the one nearest alike—is constituted. In these latter there is nothing approaching "a period"—in the four-stroke sense—for any phase but compression and working, or more than a small portion of any stroke for induction and exhaust. In the Chadderton cycle, on the contrary, the exhaust occurs at the end of the outstroke, and continues to the end of the instroke, of the outer piston.

Some Special Circumstances.

This certainly secures, not so much scavenge for anything but the products of complete combustion, as pressure relief. So

THE
GRAHAME-WHITE
AVIATION Co. Ltd.

AERONAUTICAL ENGINEERS & CONSTRUCTORS,

LONDON AERODROME, HENDON.

Proprietors of The London Aerodrome and the Grahame-White School of Aviation.

S.B.A.C.
THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS

that there shall be no back-pressure against the subsequent induction; which—to pay for the length of the exhaust—has a shorter time for entry than in any other two-stroke cycle. So short indeed, that it is actually a charge injection, at such a necessarily high-pressure as 75 lbs. instead of the desirable 15 lbs. of ordinary transference. Hence the necessity for the most ample port area; wholly located furthermore within the restricted range of valve and piston travel during that brief charging moment. Hence also the extreme value of this particular valve design, with its great width and unbroken circle of port-series. Which thus comes nearer the i.c. ideal of the opening and closing pot-lid than any other.

And Reasons Why.

But the point is, how is it all done? How, in the first place, is that channel-valve held locked during the entire working-stroke? Solely by the pressure occurring: which acts through the inlet ports, and upon the top or horizontal part of the channel-valve, to hold it down and thus keep the exhaust ports closed with its deeper inner vertical flange. At the same time, no escape can take place through the inlet ports to the charge entry, because the outer flange-extension of the combustion chamber—enclosing the valve—closes off escape everywhere else: and the entirely closed entry cavity in the top corner of the piston on the left, has run upwards beyond the entry passage. So that the cylinder-wall prevents any loss of pressure. At the same time it will be noticed that the trunk of the outer piston itself has cut out the entry passage, and prevents any leakage of the oncoming charge into the exhaust chamber above, irrespective of its pressure: thus rendering that a.o. non-return valve wholly superfluous.

Results: and some Conclusions.

In any case it will be obvious that with the internal pressure itself holding the valve closed, and with no external means of opening it, not only will the M.E.P. be maintained to the maximum, but that it cannot be opened until the last of the combustion effort has expired. What this should mean in efficiency, especially in a long-stroke motor, need not be elaborated, provided always that no slowing effect is produced.

Now, of course, the exhaust is due to begin, so how is the valve supposed to be opened? In the case of a rotary motor the weight of the valve, acting centrifugally and tangentially, should suffice, as claimed, for the initial lift; after which the exhaust blow would be quite enough to hold the valve open during the instroke, until the internal pressure was wholly relieved. By this time, however, the piston cavitation has come into coincidence with the induction entry passage. and the induction pressure, working upon the top of the valve, snaps it down to close off the exhaust ports, and the combustion chamber is immediately filled through the inlets.

But here I am inclined to maintain the possibility—though the means concern no one else—that the mere fling of the piston could be made to effect this result, as soon as the combustion effort had died out, in any type of motor, a V as well as a rotary or radial. Also that the assumption to the contrary is far from obvious; notwithstanding even the assertion of the author of the cycle!

(To be continued.)

THE PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by The Aeroplane from the current Official Patents Records:—

Patent Applications.

Billinton, H. L. Interrupter gear to fire machine-gun on aeroplane. No. 9512. July 3rd.

Bowen, E. W. Road or aerial vehicles. No. 9507. July 3rd.

Bushell, J. H. Level or angle indicators for aircraft. No. 9514. July 3rd.

Corder, B. J. Anti-aircraft device. No. 9687. July 5th.

Cowtan, D. M. Aircraft, etc., construction in metal. No. 9689. July 5th.

Drake, R. R. Manufacture of airscrews. No. 9851. July 7th.

England, E. C. G. Means for supplying fuel, water, or oil in engines of aircraft, motor-cars, motor-boats, etc. No. 9750. July 5th.

Kelly, W. H. Flying machines. No. 9608. July 4th.

Lécuyer, M. Flying machines. No. 9800. July 6th.

Read, H. A. Moutray-. Aircraft. No. 9673. July 4th.

Scanes, A. E. L. Instrument for indicating position of aircraft. No. 9635. July 4th.

Sutcliffe, J. A. Means for preventing penetration of shot through petrol tanks of aircraft, armour-plating, etc. No. 9545. July 3rd.

Tarrant, W. G. Spars, beams, etc., for aircraft. No. 9524. July 3rd.

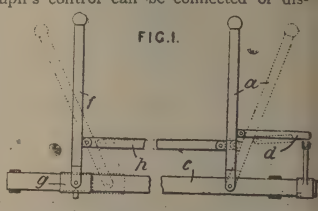
Tolkowsky, S. Propeller-driven craft. No. 9604. July 3rd.

Warne, S. Toy aeroplane. No. 9621. July 4th.

Complete Specifications Accepted, prints of which are obtainable on and after July 26th, 1917.

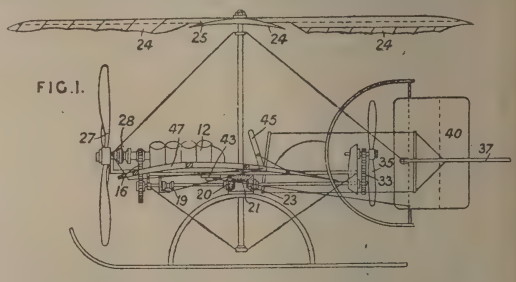
107,471. Aug. 24th, 1916. Allan, A. Flying machine.

107,509. Oct. 28th, 1916. Aeronautical Instrument Co., and G. Brewer. Devices for guiding flexible connections for operating valves, rip panels, and the like in aerostats.



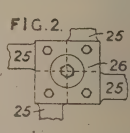
107,510. Oct. 31st, 1916. O'Brien, A. H., and S. Fastenings for aviators belts and the like.

107,519. Nov. 16th, 1916. Garscadden, T. D., and Boyne, W. K. Aerial screw propellers.

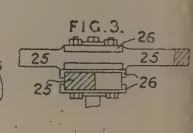


Abridgments of recently published Specifications.

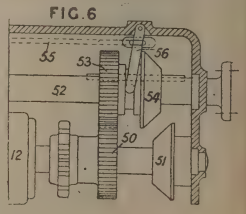
106,116. Aeronautics. Martinsyde, Ltd., Martin, H. P., and Handasyde, G. H., Brooklands Aviation Ground, Byfleet, Surrey. April 20th, 1916, No. 5818.



Steering and Balancing.—A dual control for aeroplanes, in which the observer's or pupil's control can be connected or disconnected by the pilot, comprises a main lever *a* pivoted to a shaft or tube *c*, and a secondary lever *f* pivoted to a sleeve *g* capable of sliding and turning on an extension of the shaft or tube *c* but adapted to be locked to it by a plug controlled by a wire. Lateral and longitudinal movement of the lever *a* operates two controls respectively by turning the shaft *c* and by moving a link *d*. A link *h* enables the link *d* to be moved by the lever *f* when the sleeve *g* is secured to the shaft *c*.



106,092. Aeronautics. Fortescue, A. J., Loftus Street, Arncliffe, near Sydney, Australia. April 20th, 1917, No. 5566. Convention date, March 24th, 1916. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act.



Aerial Machines without Aerostats; Propelling.—An aerial machine comprises main planes 47 above which rotates a lifting screw propeller 24 driven from the engine 12 through chain gearing 16, clutch or change-speed gear 19 and bevel gearing 20, 21. A tractor propeller 27 may be driven from the engine 12 through a clutch 28, or from an independent engine. A second driving-propeller 35 is arranged in front of the rudder 40 and driven by bevel-gearing 21, 23 and chain gearing 33. In a modification, the tractor propeller 27 may be driven from the engine 12 through friction cones 51, 54, Fig. 6, when starting, and afterwards through toothed gearing 50, 53, the wheel 53 and cone 54 being, for this purpose, slid on the shaft 52 by an arm 56 and rod or wire 55. The blade arms 25 of the lifting-propeller are secured in caps or plates 26 keyed or bolted on the shaft as shown in Figs. 2 and 3.

Steering.—The rudder 40 is arranged immediately behind a propeller 35 in order to increase the steering effect. Elevators 37 are operated by longitudinal movement of a lever 45, which may be moved laterally to adjust the main planes. A foot-lever 43 operates the rudder.

(Continued from page 162.)

forces responsible for the attack on a convoy near Bakuba, states :—

A mobile column, accompanied by aeroplanes and armoured cars, inflicted effective chastisement on the enemy, who especially suffered severely from aerial attacks with bombs and machine-guns.

On July 10th two German aviators surrendered themselves to our troops at Samarra, stating that they had abandoned two machines, which were burnt in the desert, and that two other German aviators, who were unable to walk, had been left behind. British armoured cars were at once dispatched to search for the missing men, and if possible to bring them in.

JULY 11th.—The G.O.C. British Forces in Salonika reports :—Our aeroplanes have bombed Drama, Porna, and Angista, and various points on the enemy's line of communications in the Upper Struma Valley.

JULY 12th.—The G.O.C. British Forces in Palestine reports :—Encounters between patrols are of constant occurrence, but there is no change in the general situation.

On July 3rd four small bombs were dropped on Port Said by a hostile aeroplane, and two persons were wounded.

THE CASUALTY LIST.

Reported July 11th.

KILLED.—Carter, Sec. Lt. H. W., R.F.C.

PREVIOUSLY REPORTED PRISONER, NOW REPORTED WOUNDED AND PRISONER IN GERMAN HANDS.—Lloyd, Sec. Lt. E. A., Yeomanry and R.F.C.

KILLED.—R.F.C.—Gray, 1872 Sgt. L. (Aberdeen).
Pocock, 77922 2nd Cl. Air Mech. W. (Isleworth).

DIED.—R.F.C.—Thomas, 41936 1st Cl. Air Mech. J. W. (Boncath).

PERSONAL NOTICES.

DEATHS.

BOTTOMLEY.—Sec. Lt. Edwin Rhodes Bottomley, R.F.A., attached R.F.C., was the second son of the late Benjamin Bottomley, solicitor, of Bradford, and of Fieldhurst, Ben Rhydding, Yorks, and of Mrs. Bottomley, of Ben Rhydding. He was educated at Shrewsbury School and was for three years a member of the O.T.C. there. On leaving he entered the firm of Lucien Marcan's Successors, of Bradford, but was only there a few months, as on the second day of the war he enlisted in the 4th West Riding Brigade, shortly afterwards receiving a commission in the same brigade. He transferred to the R.F.C. in 1916, obtained his pilot's certificate and his "wings" at the beginning of this year, and was shortly afterwards sent out. He was killed while flying over or close to the German lines on June 2nd, aged 22.

CATHIE and WILLIAMS.—A fatal flying accident occurred on July 11 resulting in the death of Sec. Lt. Cathie and Sec. Lt. Henry W. Knowlson Williams, both of the R.F.C.

While flying in the vicinity of their aerodrome the petrol tank caught fire, and their bodies were burnt almost beyond recognition.

Mr. Knowlson Williams was the only son of the late H. W. Williams and Mrs. W. G. Cozens, of Glastonbury, late of Clifton and Weston-super-Mare. He was 21 years of age.

EVANS.—At an inquest at Croydon on July 11th on the body of Lt. Stewart Nicholson Evans, R.F.C., aged 26, the theory was advanced that while in the clouds something went wrong with the controls of his machine, which crashed to earth. A verdict of "Accidental Death" was returned. He was the brother of Gladys and Gwynn Evans and Phyllis Catchpole.

HAMER.—Lt. Harold Hamer, R.F.C., reported missing on June 6th, now reported killed on that date, in his 26th year, was the fourth son of the late Mrs. A. A. Hamer, of Alistre, St. Annes-on-Sea. He was at Shrewsbury School (1906-10), and enlisted in the Loyal North Lancashire Regiment in August, 1914, being shortly afterwards gazetted. In 1915 he transferred to the R.F.C., and saw active service in the Sudan, being engaged in the battle which resulted in the break up of the forces of the Sultan of Darfur. In the summer of 1916 he was at Salonika, but returned to England in September. He obtained his "wings" early this year, and left for the front in May.

HORSLEY.—Capt. Wilfred Palmer Horsley, M.C., R.F.C. (killed in action), formerly held a captain's commission in a Service battalion of the East Yorkshire Regt. He was afterwards attached to the Trench Mortar Batteries. His award of the Military Cross was in the last New Year's Honours List.

HUNSTONE.—Sec. Lt. G. N. Hunstone, R.F.C., killed while flying in France on June 28th, was the only son of the late Mr. George Hunstone, of Manchester and Mrs. Hunstone, of The Haven, Lingfield Avenue, Kingston-on-Thames. He was only 19 years old, and was educated at Chalmley House, Eastbourne, and Marlborough College. Joining the Artists Rifles in 1915, he received his commission in February of this year, and was gazetted flying officer in May, proceeding to France in June. Mr. Hunstone was killed the day after joining his squadron.

JAKINS.—A verdict of "Accidental Death" was returned on July 11th at an inquest in the Eastern Counties on the body of Sec. Lt. Jakins, aged 20, an assistant flying instructor, whose machine fell and was smashed owing to the engine stopping. It was stated that he was a highly popular and expert flier, and at 15 years of age had written a book on flying.

Walter Vosper Jakins, R.F.C., was the only son of the late Sidney Milroy Jakins, and of Helen Jakins, of 22, Ulster Place, Regent's Park, N.W.1, and late of Woodford.

KNIGHT.—Capt. Arthur Gerald Knight, D.S.O., M.C., R.F.C. (previously reported missing, now reported killed), was gazetted a companion of the Distinguished Service Order on Dec. 11th last "for conspicuous gallantry in action. He led four machines against eighteen hostile machines. Choosing a good moment for attack he drove down five of them and dispersed the remainder. He has shown the utmost dash and judgment as a leader of offensive patrols." He had received the Military Cross a month before, when the "London Gazette" stated that "he has shown great pluck in fights with enemy machines, and has accounted for several. On one occasion, when a hostile machine was interfering with a reconnaissance, he attacked at very close range and brought down the enemy machine in flames."

LECKIE.—Lieut. and Flight Comdr. Graham Leckie, B.Sc., London, R.F.C. (killed in action on July 7th), was the second son of the late Alexander Leckie, of London, and of Mrs. Leckie, Langside Terrace, Glasgow. He was 28 years of age, and formerly held a commission in the R.G.A. Special Reserve. He had his "wings" in February of last year.

LITTLER.—Sec. Lt. Tom Littler, R.F.C. (formerly of Artists Rifles O.T.C.), who was killed in an air fight on July 3rd, was the only child of Mr. and Mrs. John Littler, of Simla, Brixham. He was aged 19.

McARTHUR.—Capt. and Flight Comdr. Lawrence William McArthur, M.C., H.A.C., and R.F.C., previously reported missing, was killed on May 27th, aged 26. He was the only son of Mr. and Mrs. W. McArthur, of Chislehurst, Kent, and was educated at Malvern, Versailles, Tours, and Heidelberg. A member of the H.A.C. before the war, he left for the front with the first contingent in September, 1914, and in June, 1915, was awarded the Military Cross for conspicuous bravery in action at Hooge. Here he was severely wounded, and on recovery entered the R.F.C., and since October, 1916, has been engaged at the front. He was mentioned in dispatches twice, and was gazetted flight commander last January.

MACGREGOR.—Sec. Lieut. Thomas Charles Stuart MacGregor, H.L.I., attd. R.F.C., who was killed on June 8th, aged 20, was the second son of Mr. and Mrs. W. O. MacGregor, of Hazaribagh, India. He was educated at Malvern College, and was in the O.T.C. He received his commission in November, 1914, and joined the H.L.I. in France in September, 1915. He was in the Ypres salient all that winter, and was wounded on May 10th. After three months' leave he joined the R.F.C., and was sent to the front on May 9th. He was doing useful work when both he and his observer were killed in the air by a shell.

O'LONGAN.—Sec. Lieut. P. C. Stacpoole O'Longan, Royal Irish Regt., attd. R.F.C., killed on June 1st, in his 19th year, was the youngest son of Mr. and Mrs. Paul O'Longan, of London, and grandson of the late Joseph O'Longan, M.R.I.A., well known in literary circles in Dublin. He was educated at King's College, and was gazetted from Sandhurst to the Royal Irish Regt., and attached R.F.C. He obtained his "wings" on March 19th, and went to the front on April 26th as a scout pilot. He was an expert horseman, and a good all-round athlete, and a few weeks before his death published a little book of poems entitled "Last Post and other Poems," the majority of which were written in his 16th year.

His commanding officer writes:—"Your son was very brave, and although unfortunately we only had him for a comparatively short time, we all liked him immensely. Everyone took to him at once, and he was very popular. He was looked upon as being one of the best of partners on a patrol, and a comfort to the rest. . . . He was doing most awfully well, and had already done real good work, and I am sure he would have done great things. I send you an extract from a German document. . . . It shows, at any rate, that your son was game, and fighting to the last minute, as everyone who knew him expected him to be." According to the German message Mr. O'Longan was brought down by enemy airmen, but when falling, and only 200 metres from the ground, he turned his machine-gun on their fighting aeroplanes, but was shot down by rifle-fire from the ground.

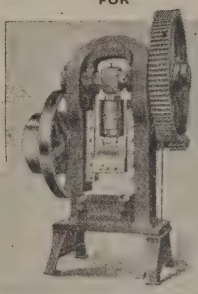
PLATT.—Capt. Lionel Sydney Platt, Lancers and R.F.C., reported missing April 13th, now known to be killed, was the only son of Sydney Platt, St. Bruno, Sunningdale. He was 32 years of age.

RYDER.—Lt. William Harold Ryder, Yeomanry, attached R.F.C., who was killed in action on July 6th, was the third son of Mr. C. F. Ryder, of Scarcroft, near Leeds, and Thurlow, Suffolk. He was aged 20.

He had his commission in the Yeomanry in March, 1915, and in February of this year he was gazetted flying officer R.F.C.

SALMON.—An inquest was held at Dartford on July 10th on the body of Sec. Lt. Wilfrid Graham Salmon, R.F.C., who met his death on July 7th in the air raid.

Lt. Douglas Gordon Nairn, Adjutant R.F.C., said that Mr. Salmon, who was a qualified pilot, went up on July 7th at 9.40. Witness saw him coming down. He appeared to lose control of the machine, which was in perfect order when he ascended. On examination of the machine after the fall it was found that 55 rounds of ammunition were gone from the magazine.



Hubert Williams, of Erith, a discharged soldier, said he saw the machine fall, and assisted to get the pilot out. The machine was smashed, and there was a wound in the officer's head which looked like a wound from a machine-gun bullet.

Major Glen Knight, R.A.M.C., who made a post-mortem examination, said that Mr. Salmon had two lacerated wounds in the forehead, and the skull was fractured from ear to ear. Prob-

ably that on the head was a gunshot wound and the fracture was caused by the fall.

Capt. Herbert Sison, R.F.C., asked the last witness if it was possible for a man after being hit by a bullet to lose and regain consciousness, and then lose it again. The reply was affirmative.

Capt. Sison said he saw the machine about 2,000 ft. up coming down spinning sideways. Thinking it was someone coming down safely he momentarily looked away, and a few seconds later it was down. The machine was found to have the petrol tank punctured from side to side by a bullet and all the petrol gone. A wire control was also hit by a bullet. He thought if Mr. Salmon could have regained consciousness he could have landed safely. The Coroner said there was no doubt this was another case of a life sacrificed for the country.

A verdict was returned to the effect that death resulted from wounds received in combat with German aeroplanes.

[It is somewhat curious that so much publicity has been given to this casualty, as compared with the concealment of the deaths of the gallant officers who were killed during previous aircraft attacks.—Ed.]

TROTTER.—Lt. Stuart Fowden Trotter, Canadian Infantry, attached R.F.C., killed on July 6th, was the second son of Mr. and Mrs. J. Glass Trotter, of 218, Stanstead Road, Forest Hill, and dearly-loved husband of Dorothy Beryl Trotter, aged 31.

VAN GOETHEM AND TATHAM.—A verdict of "Accidental Death" was returned at an inquest at Brockenhurst, Hants, on July 16th on the bodies of Captain Henry Edward Van Goethem, R.F.C., of Parkstone, Dorset, and Sec. Lt. I. Mordaunt Tatham, of Natal, South Africa. The evidence showed that Capt. Goethem was giving the junior officer his first instruction in flying a particular type of machine, when it nose-dived to earth and burst into flames. Both officers were killed.

Captain Van Goethem, R.F.C., was twenty-three years of age, and the son of Mr. and Mrs. E. Van Goethem, of Tregarthen, Parkstone, Dorset. He was appointed flight commander, R.F.C., in Jan., 1916, with the temporary rank of captain.

YOUNG.—In the course of the raid on July 7th on this country by enemy aeroplanes Sec. Lieut. John E. R. Young, R.F.C., and his observer were shot down and killed after a plucky fight against the raiders. Mr. W. S. Young, of 76, Mitcham Lane, Streatham, has received from his son's Squadron Commander the following letter:—

"It is with the deepest regret and sympathy that I have to write and inform you of your son's death, which took place on Saturday during the enemy aircraft attack on this country. Your son, as you know, had only been in my squadron for a short time, but quite long enough for me to realise what a very efficient and gallant officer he was and what a tremendous loss he is to me. He had absolutely the heart of a lion and was a very good pilot. Your son has been up on every raid of late, and has always managed to get in contact with the enemy machines. The last raid, which unfortunately resulted in his death, shows what a very gallant officer we have lost. Almost single-handed, he flew straight into the middle of the twenty-two machines, and both himself and his observer at once opened fire. All the enemy machines opened fire also, so he was horribly outnumbered. The volume of fire to which he was subjected was too awful for words. (To give you a rough idea—there were twenty-two machines; each machine had four guns; each gun was firing about 400 rounds per minute.) Your son never hesitated in the slightest. He flew straight on until, as I should imagine, he must have been riddled with bullets. The machine then put its nose right up in the air and fell over and went spinning down into the sea from 14,000 ft. I unfortunately had to witness the whole ghastly affair. The machine sank so quickly that it was, I regret, impossible to save your son's body; he was so badly entangled in the wires, etc. H.M.S. —— rushed to the spot as soon as possible, but only arrived in time to pick up your son's observer, who, I regret to state, is also dead. He was wounded six times and had a double fracture in the skull. I cannot speak too highly of the magnificent behaviour of your son. All that I can say is that he was a most gallant officer, and that I am proud to think that he was in my command. I hope that you and your family will accept my sincerest sympathy and also the sympathy of all his brother officers in your great loss."

ENGAGEMENTS.

GOSSAGE—O'BRIEN.—An engagement is announced between Major Ernest Leslie Gossage, M.C., R.F.A. and R.F.C., elder son of Colonel E. F. Gossage, V.D., late Brigadier-General, and Mrs. Gossage, of Dorin Court, Upton Heath, Chester, and Eileen Gladys, only daughter of Brigadier-General E. D. J. O'Brien, C.B., late Hussars, and Mrs. O'Brien, The Rectory, Buxted, Sussex, and granddaughter of the late Colonel Sir Terence O'Brien, K.C.M.G., some time Governor of Newfoundland.

GOULD—SPERLING.—An engagement is announced between Capt. L. N. Gould, M.C., R.G.A. and R.F.C., eldest son of Mr. Lionel Gould, of The Gable House, Bilton, Rugby, and Barbara, only daughter of Mr. C. F. D. Sperling, of Beresford House, Leamington, and Dynes Hall, Halstead, Essex.

MOLESWORTH—STEELE.—The engagement is announced between Capt. W. E. Molesworth, Royal Munster Fusiliers, attd. R.F.C., son of Col. W. Molesworth, C.I.E., I.M.S., and Mrs. Molesworth, of Cruxfield, Duns, Berwick, and Dorothy, second daughter of Col. St. G. L. Steele, C.B., I.A., and Mrs. Steele, Kelston, Hythe, Kent.

RAWLINS—BAKER.—A marriage has been arranged, and will shortly take place, between Arthur Charles Champion Rawlins, Lieut., R.F.C., third son of Mr. and Mrs. Charles Rawlins, of Dunedin, New Zealand, and Sydenham Hill, and Phyllis Yvone Marion, elder daughter of Mr. Sidney H. Baker, of 6, Marine Square, Brighton.

THOMPSON—MILLS.—The marriage arranged between Lieut. Stewart W. Thompson, R.F.C., and Madge, daughter of Mr. and Mrs. H. Slowburn, Richmond House, Wimbledon Common, and widow of Gordon Mills, Coldstream Guards, will take place at Holy Trinity Church, Putney Hill, on Wednesday, July 18th, at a quarter past two o'clock. All friends will be welcome at the church.

MARRIAGES.

FLEMING—FAIRLIE.—On July 14th, at St. Augustine's, Queen's Gate, Capt. Wilfrid Allan Fleming, Devonshire Regt. and R.F.C., only son of A. S. Fleming, Indian Civil Service (retired), Millholme, Chagford, Devon, was married to Dorothy Norma Paterson Fairlie, younger daughter of Lt.-Col. W. F. Fairlie, Hillside, Gorey, Jersey, by licence.

KINGSFORD—PEPPERDINE.—On July 10th, at Marylebone, Sec. Lt. Alfred Reginald Kingsford, New Zealand Expeditionary Force and R.F.C., was married to (Nurse) Charlotte Pepperdine, of Devonshire Street, Portland Place, W., by special licence.

POTTS—THORNDIKE.—On the 14th inst., at St. Peter's, Lee, S.E., William Janson Potts, Lt., R.F.A. and R.F.C., only surviving son of the late William Potts, Esq., of Sanderstead Hill, was married to Gladys Isabelle, only child of the late Major F. H. Thorndike, and R. Sussex R., by the Lord Bishop of Manchester, and the Rev. Basil P. W. French, uncles of the bride, assisted by the Rev. Canon Ottley, Vicar of the Parish.

SHILSTONE—SEMPLE.—On July 10th, 1917, at Christ Church, Richmond, S.W., Lt. Arthur Bernard Shilstone, R.F.C., the second son of W. A. Shilstone, I.S.O., Assistant Secretary, P.W.D., India, was married to Ruth, third daughter of James Charles Semple, F.R.G.S., F.R.C.Inst., M.R.I.A., 24, Beaumont Avenue, Richmond, and Kingstown, Ireland, granddaughter of John Semple, C.E., formerly High Sheriff of Dublin, and grandniece of Sir Thomas Whelan, formerly Lord Mayor of Dublin, by special license, by the Rev. W. Blerber, M.A., Vicar.

TAYLOR—DEWBERRY.—On July 9th, at Great St. Mary's, Cambridge, Capt. Malcolm Lincoln Taylor, R.F.C., son of Leo Taylor, Esq., C.C., of Walthamstow and Southend-on-Sea, was married to Ada Gwendoline, daughter of H. W. Dewberry, Esq., of Cambridge, by the Rev. C. L. Hulbert, Vicar.

BIRTHS.

HOLLIDAY.—On July 13th, at Hastings, the wife of Capt. F. P. Holliday, D.S.O., M.C., R.F.C., a daughter.

LEWIN.—On July 12th, at 77, South Side, Clapham Common, London, S.W.4, the wife of Sec. Lt. H. S. Lewin, R.F.C., of a daughter.

R.F.C. Officers Missing.—Will those communicating with R.F.C. prisoners in hospital or camp in Germany kindly inquire as to fate of Lt. T. Thomson and, or, Sec. Lt. A. M. Turnbull, missing on April 25th, and report to M. H. Turnbull, 9, Chlorine Gardens, Belfast?

* * *

Capt. James Stuart, R.F.C., has been missing since April 13th. His mother, Mrs. Stuart, of Somerset, Coleraine, Ireland, would be glad of news.

* * *

Among those to whom the committee of the Royal Humane Society has awarded medals are the following:—

Lt. C. M. Morrell, Royal Munster Fusiliers and R.F.C., an interned officer, for his gallantry in saving a Dutchman at Scheveningen, Holland.

Thomas McDonald, R.F.C., for his attempt to save Sergeant Brooks, whose aeroplane fell into the sea at Aboukir an Mar. 21st.

AVIATION KIT
AT
Dunhills Ltd
2, CONDUIT STREET, LONDON, W.

THE equipment of the Aviator must always be of the Best. Not only must his garments be as warm and serviceable as money can make them, but the cut and finish must be of as high standard to match. Just as the Government spare no expense to provide what they consider the best for the Flying Service, so to supplement what the Government issues DUNHILLS put all their experience and skill into giving the Best Quality and the Best Value.

THOSE who do not possess our Catalogue should write for one at once.

THOSE who do not know our shop at No. 2, Conduit Street should look in next time they get leave.

The forced landing of a balloon in Holborn on July 11th caused a deal of excitement. Coming from the westward, the balloon was observed to be in difficulties over the City for some time. There was no wind, and it drifted slowly. Soon it was noticed that the envelope was flabby, as if the gas were leaking out. A large crowd followed its course as it drifted along over the housetops down Holborn towards Chancery Lane. Slowly the balloon dropped until the basket hit the chimney pots of Bank Chambers. The guide rope was then in the street and a number of men caught hold of it and hung on.

Traffic along Holborn was entirely held up, and obeying the directions of the four R.F.C. officers who formed the crew, the crowd swung the balloon clear from the roofs, and, at the expense of a few overhead wires, pulled the basket safely to the ground in the centre of the road opposite Chancery Lane. Eventually the envelope, together with the basket, was dragged into the courtyard of Gray's Inn pending removal.

* * *

An inquest was held at Lincoln County Hospital on July 12th on the body of a ploughman who was knocked down and fatally injured by an aviator who was making a landing. The aviator at the time was flying at a speed of 65 miles an hour.

The aviator stated in evidence that he saw nothing until the accident occurred. The employer of the man who was killed said there had been some narrow escapes, and suggested that red flags should be placed where the men were working.

The jury found that the affair was purely accidental.

FRANCE.

Official Communiqués.

July 10th.—Army of the Orient.—British aviators bombarded Petric (in Bulgaria, Strumnitza Valley).

July 10th.—Army of the Orient.—An enemy aeroplane was forced to land near Livadi, south of Liumnitza.

July 12th.—Army of the Orient.—British aviators bombarded the railway station at Angista, 17 miles east of Seres (Struma valley).

The German captain and pilot who were found in the enemy machine captured yesterday (July 10th) have been made prisoners.

July 13th.—During the period from the 8th to the 10th of July ten German aeroplanes were brought down on our front, including eight in aerial fights and two by the fire of our machine-guns. Besides, eight enemy machines fell in their own lines in a badly damaged condition.

July 14th.—During the night German aeroplanes dropped bombs on the entire region north of Nancy. Two women and a child was killed.

July 16th.—Army of the Orient.—An enemy aeroplane brought down by a British machine fell in flames near Angista (Struma Valley).

* * *

The Official Journal published on July 11th contained the text of an Army Order conferring the Croix de Guerre and Palm upon the following members of the Royal Flying Corps in France:—Elder, Davies, Draper, Pearks, Dallison, Newberry, Rees, Potter, and Glen. No ranks are given.

* * *

Lord Donoughmore, British Red Cross Commissioner in France, has reported to Red Cross headquarters, 83, Pall Mall, that Chef de Demi-Section Frederick Hindle and Voluntary Driver Thomas Percival Gillibranc, of Section Sanitaire Anglaise No. 16—one of the British Red Cross units working with the French armies—have been cited in an Order of the 33rd Division for going to the rescue of a French aviator who had fallen during an air fight and was lying wounded with his machine, which the enemy were seeking to destroy by a very heavy fire.

They disengaged the aviator from his machine and bore him to a place of safety.

* * *

At the Fête Nationale held in Paris on July 14th, 150 aeroplanes flew over the parades and subsequent procession. The Aviation Militaire was represented by Capt. Guynemer, who carried the flag of his escadrille, which apparently was singled out as the most successful squadron in the French Army.

* * *

It was reported from Paris on July 12th that the French Seaplane Patrol Service at various centres carried out during the month of May and in all weathers 2,627 fiights, averaging 1¾ hours per flight. On 14 occasions French seaplanes attacked German submarines, whilst in 3 cases they were successful in locating enemy mine fields. An enemy cruiser was also attacked Eight night bombardments on enemy bases in Belgium and the Adriatic were also successfully carried out, whilst as the result of 3 air battles 2 enemy machines were destroyed. Assistance was also rendered to a vessel in distress.

On July 1st a large vessel, which was torpedoed by a German submarine in the Atlantic and was abandoned by the crew as it seemed on the point of sinking, was successfully towed to safety by the small escorting vessels. On July 6th a steamer, which stranded near the island of Yeu, in the Bay of Biscay, in order to escape from a German submarine, was successfully refloated and brought into port. On the same day and in the same vicinity another steamer, which was also regarded as lost, was successfully refloated and brought into port.

* * *

A seaplane belonging to the Brest station, while reconnoitring on July 14th, sighted a sailing ship which was sinking and near her a big submerged submarine. The seaplane dropped bombs on the latter, which was not seen again.

* * *

The Paris "Journal" announces that the French champion cyclist, Octave Lapize, has been killed in the course of an aerial battle which four French aeroplanes were carrying on with nineteen German machines in the environs of Nomeny.

GERMANY.

Official Communiqués.

July 10th.—The results of the engagements against the enemy aircraft forces in the month of June were good.

Our enemies have lost 220 aeroplanes and 33 captive balloons through the effect of our weapons. Our anti-aircraft guns shot down 60 enemy aviators, the remainder having been brought down in aerial fighting.

Our losses amount to 68 aeroplanes and three captive balloons.

July 11th.—During the past few days our air squadrons successfully and repeatedly showered bombs on the North Courland coast, on the batteries, barracks, and harbour works near Reval and Arensburg, and on the island of Oesel (north of the Gulf of Riga). Hits and fires lasting a long time were observed. In spite of the violent shooting of hostile batteries our aeroplanes returned safely from all their undertakings.

July 13th.—In the course of numerous aerial engagements the enemy lost 17 aeroplanes; two others were also brought down by anti-aircraft fire.

First Lt. Ritter von Tutscheck, who on July 12th (?) brought down two enemy aviators, yesterday won his 16th aerial victory by shooting down a captive balloon.

July 14th.—Twenty-one enemy aviators and one captive balloon were brought down yesterday (Friday) in aerial engagements and by means of defensive fire.

* * *

Reports from Lake Constance agree that no more airships are now being constructed at the Zeppelin factories at Friedrichshafen. The thousands of workmen employed there, according to an Exchange telegram, are working on aeroplanes.

* * *

The Wolff Bureau has issued the following amusing narrative:

Information has reached us to the effect that the English have formed a special squadron composed of volunteer aviators, whose duty it is to shoot down their most dangerous adversary, Baron von Richthofen. The Victoria Cross, a brand-new aeroplane, to remain his own property, immediate promotion, and a prize of £5,000 in cash are offered as a bait to the man who succeeds in the attempt to kill the best German air fighter.

Apart from this a further reward of £1,000 is promised to the flying division of which a member contrives to capture Richthofen, either alive or dead. Moreover a sum of £500 is promised to the leader of the brave band. The War Office order to this effect has been read out to all English aviators.

[What an astonishing similarity there is between the English and German press people, whether on paper or in news agencies! This yarn is quite in the best English manner and recalls the story of the reward offered by the Kaiser for the head of Commander Samson.—Ed.]

RUSSIA.

Official Communiqué.

July 11th.—Baltic Sea.—On July 9th, squadrons of enemy seaplanes performed three flights over Arensburg and the region of Tserelia, dropping about 30 bombs on the roadsteads, the batteries, and other structures, without result, and causing no loss or damage.

On July 8th an enemy Zeppelin made a flight over the southwestern extremity of the Aland Archipelago.

ITALY.

Official Communiqués.

July 11th.—This morning enemy aeroplanes carried out a brutal bombing raid on Cividale (Friuli) without being justified in so doing by any military reason. The only result was a few victims in the civil population and slight damage to some buildings.

July 14th.—Aerial activity was considerable during the whole day; all our machines returned safely. An enemy machine was brought down in an air fight, and fell between Miramare and Trieste.

Against Wind & Wet

For the extreme conditions that the aviator is called upon to face—sudden changes of temperature—slashing rain—saturating mist—blizzards—THE BURFRON offers such ample security that it leaves every other flying coat "in the cart."

The fatal defect of all previous coats has been the openings in front, through which it was an easy matter for wet or cold to penetrate. THE

BURFRON

winds round the figure without openings anywhere to admit rain or wind, and is held securely by a button at the neck.

A belt has two advantages: (1) it snugs down the coat in cold weather; and (2) gives it a smart Service appearance.

THE BURFRON is made in dense Burberry-woven and proofed material, and to make security doubly sure, and to maintain the warmth essential to comfort when flying, it is lined with wool, or soft Camel Fleece.

July 15th.—There was considerable aerial activity in Carnia and on the first line of the Julian front. An enemy machine brought down in aerial combat fell in flames east of Kostanjevica.

July 16th. At dawn this morning one of our big bombarding air squadrons, accompanied by escorting aeroplanes, carried out a raid on the enemy's lines of communication east of Selo (Carso, south of Versic), where numerous troops were discovered and effectively bombed.

Our machines, which flew very low in order to drop the bombs, have all returned safely, notwithstanding the enemy's anti-aircraft fire and hostile machines, one of which was brought down and the others driven back.

This morning enemy seaplanes dropped bombs between the Isonzo and the Carso. There were a few victims, and slight damage was caused.

BULGARIA.

Official Communiqué.

July 10th.—On the right bank of the Vardar an enemy aeroplane was brought down after an aerial combat.

TURKEY.

Official Communiqué.

July 6th.—Sinai Front.—On July 4th our aviators successfully bombed the railway station of Port Said.

SERBIA.

Official Communiqué.

July 11th.—Our air squadrons dropped 42 bombs north of Kozuh and 10 in the Gradesnica valley (both east of the Tcherna). In the course of aerial fighting a German aeroplane was brought down and fell in our lines.

* * *

In a note on the variegated uses of aircraft, the "Express" says that during the Serbian retreat aeroplanes were used as ambulances for the first time. Thirteen gravely wounded men needed to be moved at once; several would lose their lives unless operated upon without delay. The journey over mountainous roads to a coast hospital was beyond their strength, so it was decided to carry them to the Italian port of Valona by aeroplane. One of the worst cases travelled over 200 miles thus, the pilot making one landing—at Prizrend—to make sure that his passenger was still alive.

[The story takes some believing, for a badly wounded man would scarcely be at his most comfortable in an ordinary aeroplane.—Ed.]

SWEDEN.

It was reported from Stockholm that on July 9th Swedish warships were dispatched in pursuit of German airships, which, according to reports received there, had been observed off the Baltic coast and were of quite a new type. They are said to carry five gondolas, and the framework is made of wood instead of aluminium. Some of these vessels were accompanying a fleet of 15 merchantmen.

U.S.A.

The House of Representatives' Military Committee by a unanimous vote on July 12th reported favourably on the Administration's Aviation Bill providing for the construction of a great aeroplane fleet. At the request of the War Department no details of the proposed construction were outlined in the measure. Mr Baker, Secretary for War, and several aviators were present, and urged the immediate necessity for augmenting the air forces of the Allied nations.

On July 15th, after a four hours' debate, but without a division, the House of Representatives voted a sum of £128,000,000, to be devoted to aviation.. It is to be hoped that now so much money has been allocated for this work, that the money will not be frittered away upon mediocre aeroplanes of types put forward by incompetent enthusiasts, but that sufficient notice will be taken of the experience so dearly bought by the Allies in Europe.

AUSTRALIA.

The Hon. W. A. Holman, Premier of New South Wales, who is at present on a visit to Europe, and who recently was at the Western front, during which visit Major-General Holmes was killed by a shell within a few feet of the Premier, is the founder of the first State Aviation School of Australia in New South Wales.

The School is situated at Richmond, near Sydney, and is designed to train men, who are qualified for the Army, in every branch of the art of aviation, prior to their military training, thus enabling the latter to be of as brief duration as possible.

Mr. Holman was greatly interested in the work of the R.F.C. while in France, and is keenly following the work of the air services in this country.

Mr. Holman has received notification that 20 battleplanes have been presented by Sir Samuel McCaughey, one of the leading pasturalists of the State. This makes a total to date of 38 battleplanes presented by New South Wales to the Imperial Government.

THE PREMIER ON AIR DEFENCE.

A deputation of members of Parliament representing Constituencies in London, introduced by Mr. Dickinson, waited upon the Prime Minister at No. 10, Downing Street on July 13th, for the purpose of placing before him their views as to the need for the improvement of the defence of London against air raids. The proceedings were private, and the report is supplied officially.

The following are extracts from Mr. George's speech to the deputation. The whole argument shows Mr. George at his very worst, as a mere politician trying to dope a lot of feeble agitators into a state of quietude. Mr. George said:—

Now, I do not want you to go away with any idea that we do not realise the importance of defending London. (Hear, hear.)

I realise that there is a special case for defending London, even in comparison with other towns, for the simple reason that it gives special satisfaction, undoubtedly, to the Germans to be able to bomb the capital of their most hated enemy. And we are proceeding upon that assumption—we are acting upon it.

I still say, on behalf of the Government, that we must put the safety of the soldiers at the front first. (Hear, hear.) If anyone in this country says "Ourselves first and our soldiers afterwards," well, then, they had better find another Government.

[Quite so, but are the soldiers at the front for the safety of their folk at home, or for their own safety?—Ed.]

I am the last man in the world to think lightly of the deaths of these poor people on Saturday or on any other day; but if you took the whole of the casualties that have occurred from the beginning of the war from hostile aircraft during the whole of these three years they are not as great as the casualties suffered by our soldiers in a small battle in France.

[If this line of argument is logical, why not bring the Army back from France, mix it up with the civilian population, let the enemy invade England unhindered, and so let the military and civilian casualties average up in proper proportion?—Ed.]

We had absolutely no hesitation in supporting the claim of our military advisers that the soldiers at the front must have the first demand upon our resources.

[Which, of course, is quite another line of argument, and quite a sound one.—Ed.]

Now you were talking about the falsehoods which have been disseminated. . . . We are told that we had squadrons here, and that those squadrons were sent to France (I think it was said against the advice of the military) at the instance of the civilians. They were sent there at the urgent request of Sir Douglas Haig.

Now, I come to the next point—about these stories, which I now hear for the first time, that these squadrons were sent for other than military purposes. They are pure inventions.

[And, anyhow, they were not the type really required to tackle Gotha formations.—Ed.]

Then there was the question, or the rumour, of a certain number of aeroplanes at Hendon which had been tampered with and were unable to go up. There is no truth whatever in it. None of those things are anything but pure inventions.

Another statement has been made to the effect of London being bare of fighting aircraft. Well, now, whose statement is that? The actual fact is that a greater number of first-class fighting aircraft went up into the air on our side than the number of the hostile aeroplanes which came over. But you cannot always, in a fight, guarantee that when you attack hostile aeroplanes you will bring them down, because, if you did, what about our aviators who are constantly crossing the German lines and coming back alive? They are attacked often by two, three, and four to one, and yet they come back, the majority of them. You may riddle a machine and yet never hit a vital spot. But, after all, out of the 22 machines that came over four were brought down.

[They were not. The official communiqué says that *one* was brought down. The R.N.A.S. stated definitely that they never saw the invaders, and that the machines brought down by them were defensive patrols which did not leave Flanders.—Ed.]

That is a pretty high percentage. It is a much higher percentage than was brought down of the French machines which crossed over the German lines just recently. In that case there were only two out of 84 brought down by the Germans, while we brought down four out of 22. Do let us be fair to these very gallant aviators, who did their best. (Hear, hear.)

[Apart from the fact that Mr. George's figures are wrong, as indicated above—the argument is fallacious. The French machines were operating in the dark, and the Germans were in full daylight.—Ed.]

The Cabinet have decided that General Smuts and I should undertake a general investigation into the matter, and we are doing it. Every reasonable precaution has been taken, and whatever practicable steps can be taken along the lines of improving the defence of London are being taken.

[If General Smuts really gives his attention to the subject good results may follow, but there should be no need for either General Smuts or Mr. George to have anything to say in the matter. The Air Board alone ought to be able to do it easily.—Ed.]

COMMON SENSE IN THE LORDS.

The following debate—as recorded by the "Times"—took place in the House of Lords on Tuesday, July 10th. As is customary, more sense and less nonsense was talked than is customary in the Lower House.

Lord Tenterden asked the Government who was responsible for the want of facilities given for the construction of aeroplanes in this country, seeing that our aerial defences at home had been for some time totally inadequate; that a Parliamentary Committee be at once formed to meet representatives of aeroplane factories with a view to taking immediate steps to increase the output of aeroplanes; and that a large standing fleet of aeroplanes be kept for home defence and for use for reprisals on German towns, the latter to be undertaken in force and by thoroughly up-to-date machines. The question, he said, had a more or less direct bearing on the recent raid on London. It was a remarkable sight to see a large fleet of enemy aeroplanes complacently flying home after having murdered defenceless women and children. It was an extraordinary thing that the raiders should not be attacked on the coast and driven away before they got here. They never got within forty miles of Paris, because it was the custom there to send up large numbers of aeroplanes at intervals every day to scout around. Also they had better aeroplane guns and their shooting was better. What was the reason we were not able to put up a better fight? It was quite evident in November when one aeroplane came over and dropped a bomb on a milk shop and killed a woman and child that if one could come it was easier for a hundred to come, because they were in battle formation and protected one another. That was eight months ago and the Government should have taken the matter in hand then and constructed a sufficient number of aeroplanes. The arguments put forward by the Government had not convinced him. Compared with our enemies we were overflowing with money and out of the eight millions a day provided for the war something ought to be spared for defending the country from these attacks. America had set aside over a million for the early construction of aeroplanes. What had we set aside? That was what he wanted to know and what "the man-in-the-street" wanted to know. He happened to be chairman of a company engaged in manufacturing parts of aeroplanes and he had asked the Ministry of Munitions and the Air Department of the War Office to be allowed to have more plant and machinery to cope with national work. He had to go down on his knees for it. The Government had got to do something. They had been long enough over it. He wanted to know when they were going to start.

The Marquess of Crewe said he took special interest in the subject for two reasons. In the first place the London County Council, of which he was chairman, had the control and management of the Fire Brigade; and, in the second place, the control and management of the schools of London, upon which terrible outrages had been perpetrated during the raids. Every one in London, even those who themselves had suffered from these attacks, knew that preference must be given to the demands of the Army at the front in this matter of the provision of aircraft. But the impression must not be created—and he did not, of course, attribute to the Government any such intention—that the sufferings and misfortunes of people here were of somewhat minor importance in comparison with the casualties which took place at the front. He thought it possible that the degree of courage and self-control which had been displayed, noticeably, he thought, by some of the very poor, might have slightly misled people into supposing that the situation was taken with greater indifference than it was. It would be a mistake to suppose that that calmness and courage of demeanour did not cover a great deal of very real resentment. (Hear, hear.) He had no doubt the holding of a private sitting in another place on Monday was necessary and desirable; but he believed some people were inclined to think that the reason for this procedure was not so much to prevent the disclosure of facts that ought not to be made public, as the keeping secret of something—he knew it was not the case—which the Government for their own reasons did not desire to make public. These considerations had to be borne in mind. Speaking as representing the largest local authority in London, he pressed upon the Government the importance and necessity of reassuring so far as they could the public, because he was quite certain that some such restoration of confidence was urgently needed.

Aeroplane Production.

The Earl of Derby was in entire agreement with the Marquess of Crewe as to the amount of courage shown by the people of London during air raids. He would look upon it as wrong to allow that courage to be used as an excuse for failing to provide as far as was possible for the defence of London. It was quite true that the claims of France must come first, but people were apt to forget the other theatres of war—Mesopotamia, Egypt, and Salonika—also required more aeroplanes. The relative value to be given to the demands from these different theatres and to the demands for the defence of this country was a problem that gave rise to the most anxious thought. Every consideration would be given to the defence of this country, bearing in mind the demands from the various theatres of war. The best way of giving protection was by doing everything they could to increase the output of aeroplanes.

"A Stupendous Increase."

It would not be right for him to give figures, but the increase was stupendous and was going on week by week, to such an extent as to tax to the utmost our training of pilots and our provision of aerodromes. Everything that possibly could be done was being done to increase the output of aeroplanes, and on this increase must rest our ultimate safety both here and at the various fronts. He hoped what he had said would give some sense of security to London, but it would be idle for him to pretend that raids on this country could be entirely frustrated and eliminated from the enemy's operations. He hoped that what was being done would make raids so costly to the Germans that it would not be worth their while to continue this barbarous form of warfare. Referring to the questions put by Lord Tenterden, he said that if debate on the air service was necessary, this was not the form in which it should have originated. The noble lord's remarks simply resolved themselves into a diatribe against the Air Board because his particular firm had not been given all the tools that they asked for.

There was not a word of truth in the assertion that the output of aeroplanes was being hampered by unwillingness to spend money. Everything in the way of aeroplanes that money could buy was being bought and would be bought. The statement that there was plenty of skilled labour was far removed from the truth. We were very deficient in skilled labour. The noble lord had complained that various tools were not issued to his firm, and asked why they were kept back. They were not kept back. Machinery was one of the greatest demands of the Air Board at present; they could only get a limited supply. What they did was to allot it to those firms they thought would make the best use of it. He did not consider that the proposal that a Parliamentary Committee should be formed to meet representatives of aeroplane factories could be looked upon as a serious proposal. As to the suggestion that a large standing fleet of aeroplanes should be kept for home defence and for reprisals, the noble lord did not appear to have grasped the fact that the two kinds of aeroplanes were entirely different and could not be used for the two purposes. He only hoped the Government would be able to show in the future that what could be done was being done, not only for our troops in the field, but for our defence at home. The surest way of securing safety both in the field and at home was by increasing the output of aeroplanes. The Air Board was getting into such a good way that we could look forward in the immediate future to a very large increase of the best kind of aeroplanes. (Cheers.)

Lord Tenterden said that as some aspersions had been cast upon him, he wished to reply. There were cries of "No!" whereupon he said he could prove his statements and challenged contradiction.

Lord Tenterden is wrong in ascribing the safety of Paris to the alleged Paris patrol, which has long been a joke in the city itself. The safety of the capital is due to the fact that raiders on Paris would never get back past the aerodromes at the front. However, he touched the right spot in his reference to the difficulty in getting permits to make aeroplanes under proper conditions.

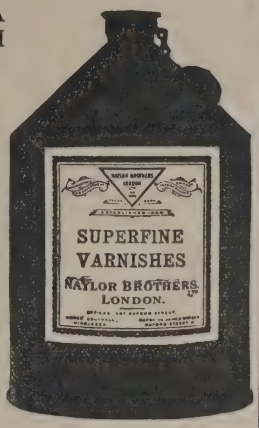
Lord Crewe's remarks on that futile Secret Session are excellent. Everyone believes that the Government's sole object was merely to shield its own weakness, and many believe it was to hide the inefficiency of Mr. Bonar Law's favourites at the Air Board, whom he is so anxious to protect from dismissal.

Lord Derby did his best in defence, but, of course, he had to accept as gospel whatever was handed out to him by his department. The output of aeroplanes has increased remarkably, but the question is whether it could not be increased very much more—as it certainly could be—and whether the aeroplanes and engines are of the type most desirable. Quantity without quality is useless.

AIRCRAFT IN THE COMMONS.

[The following questions dated June 6th, 12th, and 15th had to be held over owing to lack of space, and are now published because they affect principles of administration.—Ed.]

KENLEY COMMON. ACCEPTANCE PARK (ROYAL FLYING CORPS).



On June 6th **Sir F. Banbury** (by Private Notice) asked the Under Secretary of State for War whether he is aware that Kenley Common, one of the open spaces which the Corporation of the City of London is under a statutory obligation to maintain for the use of the public for ever, and occupying an area of about 81 acres, has been taken possession of by the military, who are cutting down the trees, some of which are 80 years old; whether he is aware that there is a larger common in the neighbourhood, Farthingdown, occupying an area of 121 acres, which is more

suitable, and whether he will stop the destruction of the trees until the other site has been considered?

Mr. Macpherson: It has been decided to take over Kenley Common as an acceptance park for the Royal Flying Corps, and as an aerodrome for the purpose of assisting against hostile daylight raids. The common has been examined by many skilled pilots, who all came to the conclusion that there was no place near at hand or near London so eminently fitted for these purposes. The alternative site suggested by my right hon. friend was also examined in the hope that, if it proved suitable, there would be no necessity to deprive Kenley Common of its trees, but the conclusion was come to that it was entirely unsuitable for the purposes named, and that, owing to its natural formation, no human skill could make it suitable. There is no intention of erecting any buildings on the common, and my information is that such trees as are being cut down are, in the main, not old trees. I regret that even these should have to be cut down, or that the natural amenities of this public ground should be in any way injured; but I am informed that this had to be done on the grounds of urgent national necessity. I should point out that this common has a main road right up to the aerodrome, and is served by three railway stations. These have facilities for unloading machines, which in the case of an acceptance park are delivered by road and rail in pieces from the contractors, and that it has the additional advantage of having a main water supply and electric-feed cables within close range. I regret, therefore, that the work must proceed.

Sir F. Banbury: Is my hon. friend aware that no notice whatever was given to the corporation of the intention of the military to occupy this space, and that when the corporation found this out, through their keepers, the military official merely curtly said that he was going to do what he liked under the Defence of the Realm Act, and did not care for anybody; and whether, under those circumstances, it is not just that the corporation, who have no desire whatever to interfere with the devotion of proper space for an aerodrome should be heard as to whether or not the other site is not a more suitable one?

Mr. Macpherson: I am sorry if the corporation feel aggrieved by non-attention to the politenesses of life; but I feel assured that my right hon. friend will admit that they are not often omitted by officers of the Royal Flying Corps. When the right hon. gentleman says that no notice was given by them, I am loth to believe that on none of those occasions did they apprise the corporation or the keepers that they intended to make the examination. I have had this morning an opportunity of going into the whole of the facts of the case, and, as I said in my answer, we deeply regret having to take any public ground; but this matter, being one of extreme urgency, necessitated our taking the space. I can only again express my regret.

Mr. Morton: Was notice given to the Town Clerk of the City of London before they took possession of this common?

Mr. Macpherson: I cannot say. My attention was not directed to that particular point, but I will make inquiry.

On June 12th, on the motion for the adjournment of the House, **Sir F. Banbury** (City of London, U.) protested against the action of the military authorities in taking possession of Kenley Common without giving any notice to the Corporation of the City, as they were bound to do under the Act. He also quoted evidence to show, contrary to the statement of the Under Secretary, that there were other sites in the neighbourhood which were quite as handy and better suited for the purpose of an aerodrome. **Mr. Hugh Edwards** (Glamorgan, Mid, L.), speaking as Vice-Chairman of the local authority of Purley, the Guardians of Kenley Common, and **Sir Stuart Coats** (Wimbledon, U.) also protested.

Mr. Macpherson said, in reply, that the taking over of this land was done only after the most careful inquiry by no fewer than at least six of our great specialists in aeronautics. He was informed that they came to the conclusion that this site was the only suitable site in that part of London after the consideration of other sites. It was required not only for an aerodrome but for an acceptance station. This was very soon after the Folkestone raid, and it was necessary to take immediate action. It was only on May 30th that a conference was held of all the departments concerned, and on that afternoon a telephone message was sent to the Town Clerk's office in the City of London saying that it was arranged to take over Kenley Common for the purposes named. He was informed that Farthing Down was hopeless for the purpose of an aerodrome, and that it would be extremely dangerous for young pilots to make use of it.

[The idea of taking over Public Commons for aerodromes seems good, as it does away with the need for the purchase of private property, and prevents the transformation of food-producing ground into waste grass. But Kenley seems a curious place for an Acceptance Park. It is not within miles of any aircraft factory, and the use of it for acceptance trials means either a vast amount of unnecessary transport, or unnecessary flying of machines before acceptance. Apparently, the whole system of acceptance tests might be improved with advantage, as the newest methods appear to be less economical in time and man-power than were those in use under the A.I.D. One would like to be assured that Kenley Common was not chosen chiefly because someone interested in acceptance tests happened to find it convenient to his own residence.—Ed.]

Royal Flying Corps.

On June 15th **Mr. Billing** asked whether officers of the R.F.C. who failed to qualify as pilots, but who wish to continue in the flying Service, are allowed to qualify as observers, or whether, under such circumstances, they are asked to resign their commissions, and that being done, are subject to conscription as privates?

Mr. Macpherson: If an officer fails to qualify as a pilot, and wishes to become an observer, he is accepted for training, as an observer, if recommended. If not recommended, an officer who belongs to another unit is returned to his unit as an officer. If not recommended as an observer, but recommended and approved as suitable for another branch of the Service, he resigns his commission and joins a cadet unit. If not recommended either as an observer, or as an officer in another branch of the Service, he resigns his commission and becomes liable to conscription.

Special Courts of Inquiry.

Mr. Billing: Is the hon. gentleman aware that numerous officers at the present time are being relieved of their commissions in the Royal Flying Corps purely and simply through friction arising with their commanding officers in France, although they are capable pilots, and in these circumstances is he prepared to set up a small Court of inquiry, or some form of appeal for these officers, who at present have no form of appeal whatever?

Mr. Macpherson: I cannot accept the statement made by my hon. friend in the first part of his question.

Mr. Watt: Is the hon. gentleman aware of the great difficulties that exist in getting out of the rank of observer into that of pilot?

Mr. Macpherson: I understand that is not true. I understand that observers very frequently become pilots.

* * *

On July 11th **Mr. Lynch** asked the Under Secretary for War whether, in view of the failure to protect London from a small force of German aeroplanes appearing in daylight, he will proceed without delay to effect necessary changes in the higher direction of London's air defences. **Mr. Macpherson** replied in the negative.

Mr. Macpherson, replying to **Mr. Billing,** stated that the official reports of the casualties in air raids included those sustained by naval and military men and Civil Servants. [Since what date?—Ed.]

Mr. Hogge asked how it was that the public had been informed this morning for the first time, through the medium of a Coroner's inquest, that one of our aviators had been shot down by the Germans on Saturday. **Mr. Macpherson** thought that did not arise out of the question.

Mr. Billing asked whether, having regard to the diametrically opposed results of our anti-aircraft fire from those anticipated whereby the German aviators were unscathed and our civilian population suffered, steps would be taken to provide more efficient anti-aircraft batteries both as regards guns and gun-crews, or protect the people of this country by removing the guns altogether. **Mr. Macpherson** said that the shooting of the London guns was observed from the ground to be good, and this is confirmed by our pilots in the air in the vicinity. Casualties from our anti-aircraft shells are inevitable if the public do not at once take cover, but the casualties would certainly be much greater if the enemy were unhampered by the fire of our guns.

Mr. France (L., Yorkshire, Morley): Will the Under Secretary lend Mr. Billing a machine, so that he may observe the gunfire from the air? (Laughter and cheers.)

Mr. Billing: Will the hon. gentleman give his serious attention to that request and grant it if possible?

[A pretty answer to Mr. France's ill-bred sneer. Nothing would please Mr. Billing better than the chance of seeing for himself.—Ed.]

Mr. Macpherson, answering Mr. Billing, said that no inquiry had been made at the Hendon Aerodrome of the Royal Flying Corps as to any incident which occurred there preceding and during the enemy air raid over London on Saturday last.

Sir H. Dalziel (L., Kirkcaldy): Is it the case that the few machines that went up were machines that were waiting there to be tested and were in such a condition that some of them had immediately to come down? **Mr. Macpherson** said the right hon. gentleman might have given notice of a question like that.

Mr. Hogge (L., Edinburgh) asked permission to move the adjournment of the House on a definite matter of urgent importance—the revelation by a Coroner's inquest of facts concerning the recent air raid, which had been officially concealed. **The Speaker** said he did not think that could be taken as a matter of urgent public importance.

Mr. Hogge urged that it was a matter of urgent public importance that War Office communiqués should be accurate. A Minister had said that all the casualties were included in Sunday's communiqué, whereas this Coroner's inquest revealed that they were not. **The Speaker:** Does the hon. Member say this casualty was not included? **Mr. Hogge:** Yes.

The Speaker: The hon. gentleman says it was. **Mr. Hogge**: It is not true. **The Speaker**: I don't think this is a matter that can be held to be of urgent public importance.

[One has on occasion thought that official communiqués are not of public importance, and that one need not altogether rely on their accuracy, but one is none the less surprised at the Speaker's statement.—Ed.]

* * *

On July 12th **Mr. G. Faber** asked the Under Secretary for War whether he could state whether any British aeroplanes were lost or damaged in the German air raid on July 7th. **Mr. Macpherson** said that it would not be in the national interest to make any information public on this point, but he would answer privately.

Mr. G. Faber asked whether it was not a fact that when certain of our aeroplanes tried to rise from the Hendon aerodrome it was discovered that their engines had been tapped. **Mr. Macpherson** replied that he could not answer that. **Sir H. Dalziel** (Kirkcaldy Burghs, L.): How many of our own machines were brought down by our guns?

On the motion for the adjournment of the House,

Mr. Hogge called attention to the air raid of Saturday last, and inquired how far the official communiqués represented an accurate account of what happened.

Mr. Macpherson promised that if the hon. Member could produce any specific incident or aircraft accident that ought to be inquired into he would do his best to see that inquiry was made. It was a fact that at certain times aeroplane squadrons might be taken from the air defence of this country for the front. He informed the House that the Prime Minister and General Smuts were personally looking into the position of the aerial defence of London.

* * *

On July 13th **Mr. Outhwaite** (L., Hanley) asked the Under Secretary for War whether, during the past years, the lives of French aviators had been sacrificed on the Western front to the same extent as had the lives of British aviators, and, if not, could he give any explanation.

Mr. Macpherson said he was not aware that our casualties had been more than those of the French, but if they were it was simply because the air fighting had been more severe on the British front.

Mr. Outhwaite: Can the hon. gentleman say whether any French Government or Commander-in-Chief would be permitted to sanction such losses as have taken place in our Army? It is asking them to commit suicide. (Cries of "Oh, oh.") Of course, you don't care how many are killed. (Renewed cries of "Oh.")

The Speaker: If the hon. Member takes the opportunity to make offensive insinuations I shall have to call upon him to withdraw. (Cheers.) I warn him that the House will not stand offensive insinuations of that kind. (Renewed cheers.)

[As a matter of fact the French have seldom been so well equipped or organised as the R.F.C.—Ed.]

* * *

On July 16th **Sir G. Cave**, in answer to a question by **Mr. Billing** as to the system it was proposed to adopt to warn London of pending air raids, said:—Considerable progress has been made in this matter. What is required is, first, that we should have reliable information when enemy aircraft are actually approaching London, and, secondly, that we should have efficient means of warning the public of their approach. As to the first point, the military authorities have promised their co-operation, and machinery for obtaining the necessary information is therefore now available and will, I understand, be improved. As to the second point, certain sirens have been tested and others will be tried to-morrow. The local authorities have been asked to suggest sites for the sirens and otherwise to assist in the arrangements for the public warning. As soon as these arrangements are completed a public announcement will be made describing the system adopted and containing instructions for securing the public safety in the event of a raid.

Mr. Billing: Was the warning of Saturday a rehearsal or a genuine air raid warning? **Sir G. Cave**: No public warning should have been issued on Saturday. The usual preliminary notice of a possible air raid was received and circulated to the police. At a few stations the officers in charge misunderstood their instructions, and instead of waiting for the second warning, "Take cover," allowed the police to go out.

Replying to **Mr. Brookes, Mr. Macpherson** said. Excluding night flying machines, 59 per cent. of the aeroplanes in possession of those Home Defence squadrons which can take part in the defence of London are first-class fighting machines.

Mr. Brookes asked whether the anti-aircraft artillery employed in the defence of London was of the latest pattern; whether any of the gunners had had experience at the front; and how many opportunities really existed for effective practice.

Mr. Macpherson: The reply to the first part of the question is in the affirmative. As the personnel are mainly Home Service men they have had practically no experience at the front. All detachments have periodical practice firing.

DR. ADDISON ON PRODUCTION.

Dr. Addison, Minister of Munitions, in a statement made on July 11th, said that the development of the aircraft industry was one of the biggest tasks the Ministry had to face. Since last January, when the Ministry became responsible to the Flying Services for supply, the programme had been steadily and largely increased. It was still expanding, and no limit could be set to it till we had enough aeroplanes and seaplanes both for attack and for defence. He added:—

"No fewer than 1,000 factories are engaged on some process or other connected with the construction and equipment of the flying machine. Output is increasing by leaps and bounds. If for the purposes of comparison you put the number of aeroplanes produced in May, 1916, at 100, then in May of this year the number rose to rather more than 300. Even this rate of increase is being accelerated. The output in December will be twice what it was in April, and the December total will be far surpassed in succeeding months.

"The number of aeroplane engines turned out monthly has been more than doubled this year already and this total will be doubled again before the close of the year."

[Which would be excellent hearing if one believed that a proper proportion of them were fit for war use, and were not officially designed wash-outs.—Ed.]

"What these figures involve in organisation will perhaps be appreciated when it is stated that a single cylinder of the rotary engine involves 48 different operations in its manufacture. As for spare parts, an enormous number have to be manufactured, as, owing to the fragility of the machine, its parts require frequent renewal, and 'spares' must be ready to hand whenever and wherever wanted.

"A growing number of workers are employed in the aeroplane factories, the increase in the last five months being 25 per cent. on the previous total. Along with this the replacement of skilled workers by women has gone on, the dilution percentage having arisen from 19 per cent. to 37 per cent. To meet the demand for labour special schools have been started all over the country, where a training of about two months qualifies a pupil to carry out some simple process in aeroplane manufacture. About 100 qualified workers are supplied each week under this system. Yet the demand is not satisfied. More and more women are wanted, both in London and in the provinces; and women of good education and good physique can render the nation no better service at the present time than by undergoing the training which is offered in these schools.

Changes due to New Inventions.

"The Ministry of Munitions has had special difficulties to overcome to reach the present degree of output and efficiency. The technical development of the aeroplane has presented peculiar problems. New types are continually being evolved. It has never been possible to say, 'This is the final form the aeroplane will assume,' and lay constructional plans accordingly. Those responsible for the manufacture of our flying machines have always had to allow for a new invention coming along and revolutionising all their projects.

"Speed, climbing power, armament have continually increased and improved since the outbreak of the war. An engine that can develop up to 350 horse-power, for example, and a single-seater scout, able to travel at 150 miles per hour, are built on very different lines from their prototypes of August, 1914. Where there is no finality there is a limit to standardisation, except in small details, and the problem of supervising the manufacture of our aeroplanes is correspondingly complicated."

[Then why standardise on obsolete types?—Ed.]

"The variety of materials used in aeroplane construction, again, has been a great source of anxiety to the Ministry. Linen, timber, chemicals for tightening the fabric of wings, alloy steel, light alloys, thin tubes are among the essential requirements of the industry. Even if these were wanted in normal quantities, there would be difficulty in getting enough in view of other necessities. But the needs of the aeroplane programme are enormous, almost passing belief. For our present programme of construction more spruce is wanted than the present annual output of the United States, more mahogany than Honduras can supply—and Honduras is accustomed to supply the requirements of the world. Besides this, all the linen of the type required made in Ireland, the home of the linen industry, and the whole of the alloy steel that England can produce can be used. As for flax, to meet the needs of the Air Service the Government has actually to provide the seed from which to grow the plant essential for its purposes. Still, despite the magnitude of the demands, all the needs of aeroplane manufacture will be met. The programme before the Ministry of Munitions is that of a maximum production."

[If the Ministry would turn its attention to reducing the amount of "scrap" produced by unnecessary rejections, and by foolish cleverness in official designs, it would not need anything like so much material.—Ed.]

AN ENGAGEMENT.

The engagement is announced of Mr. A. Dukinfield Jones, second son of Mr. E. Dukinfield Jones, of Castro, Reigate, Surrey, to Evelyn, daughter of Mr. Hugh Tennent, of 5, King's Gate, Glasgow, and Holland House, West Kilbride, Ayrshire.

Mr. Dukinfield Jones is well known to the older hands in the Aircraft Industry for his association with Mr. Howard Flanders at Brooklands. At the dissolution of the Flanders firm, he joined the D.F.W. firm of Leipzig as test pilot, and it is interesting to note that he got performances from the well-made but heavy D.F.W. machines, which exceeded the best efforts of the late lamented Herr Roempler, who was so popular at Brooklands before the war.

Mr. Dukinfield Jones has since the outbreak of war been engaged upon test work for Wm. Beardmore and Co., Ltd., at Dalmuir, Scotland, and is recognised as being one of the most experienced and reliable pilots in the country. His many friends will wish him and his bride-to-be every happiness.

A FRIENDLY ENEMY.

By the way, the earlier readers of The Aeroplane may be interested to know that those who were in Flanders early in the war state that Herr Roempler was shot down and killed near Dunkirk while making a sportsmanlike journey to drop effects and letters from captured British officers in German hands, and while carrying a note conveying his regards to his friends at Brooklands.

OUR MAN-POWER.

The following letter has been received:—

Sir,—I have been a manufacturer of Cabinet Letter Files, and have, therefore, a knowledge of joinery.

Owing to circumstances, which would take too long to explain on paper, I have had, for some few years, to be content with indoor (office) work—as a French translator.

On applying to the much-placarded "St. Ermins," I was dispatched to ,Messrs. So-and-so's factory at ———; but being without tools and (at that time—about 10 days ago) without prospect of buying any—I obtained no work. I am now in a position to buy tools, and four days ago wrote a letter to Messrs. So-and-so asking for a re-decision in favour of taking me on. But no answer has come during four days.

Yet, last week's papers (under the heading of "Strikes and Munitions") contained a speech of Sir L. Worthington Evans, M.P., in which he is reported as saying:—

"Guns, aeroplanes . . ., are still wanted for an overwhelming concentration along the Front. That makes a further dilution of skilled labour with semi-skilled and unskilled, absolutely necessary."

I am 45, active, abstainer—and my abilities (for much of the building work of an aeroplane) are well within the "semi-skilled"; yet, for want of a little influence, I am obliged to walk idly, whilst much of the remaining work (such as doping) is (so Messrs. So-and-so say), actually given to girls!

I can produce an eight years' reference (1909-1917) to one of the largest engineering firms in London.

(Signed) C. Fitzgerald.

[One suggests that potential aircraft makers without tools might be supplied with them by the manufacturers.—Ed.]

A FIGHTING FAMILY.

Comment has been made in The Aeroplane on the many occasions on which officers of the name of Bell-Irving have appeared both in the "Gazette" and the Honours List. It has now leaked out that there are no less than six sons of Mr. H. O. Bell-Irving, President of the Anglo-British Canadian Packing Co., of Vancouver, at work with the British Forces. These are Lieut. Henry B. Bell-Irving, R.N.V.R.; Major Richard Bell-Irving, R.F.C.; Major Roderick Bell-Irving, M.C.; Capt. M. Bell-Irving, D.S.O., M.C., R.F.C.; Capt. Duncan Bell-Irving, M.C., R.F.C.; Lieut. Æneas Bell-Irving. It is reported that someone has remarked that they are all "red-blooded, red-haired, and red-fibred, with grit marked all over them." The grit mentioned has no reference to the results of disintegrated landings on aeroplanes. The phrase has a psychic and not a physical implication.

MORE AMERICAN OPTIMISM.

A message from New York dated July 12th states that Mr. Cox, Governor of Ohio, addressing a meeting in Indiana, expressed the opinion that American aviators flying in American aeroplanes would bring the war to an end. "From facts in my possession," he said, "I have formed the positive belief that American aviators will break into the skyline of Germany like birds in migration, not to kill women and children or commit human slaughter in any form, but American bird-men, having reached Essen and Kiel, will destroy not only Germany's navy, but every institution which perpetuates the menace of Prussian Imperialism."

[First build your aeroplane, Uncle Sam.—Ed.]

SCENES IN AN AIRCRAFT FACTORY.—XVIII.—THE DRAWING OFFICE.—In the right foreground a slide-rule expert endeavours laboriously to work out the capacity of a tank, while the office-boy merely finds out empirically with a tin measure. To their left a messenger becomes involved in blue prints, while another office-boy discourses sweet music, to the chagrin of an "x-chaser," who is trying to keep cool and collected. Beyond him, another human calculating machine also tries to keep cool, and, beyond him, again, a mere rule-of-thumb draughtsman gets his dimensions with a foot-rule. In the middle of the picture an R.N.V.R. and an R.F.C. inspector discuss a technical point, with the firm's chief draughtsman as a strictly neutral spectator. Next them, two representatives of our Allies converse amiably. To the right, a mathematical expert, who has given way under the stress of war work is firmly but gently removed. In the left background an assistant endeavours to measure a "fair-lead," and expresses his opinion thereof to the astonishment of a juvenile tracer. Alongside her, other tracer-ladies are seen at work.

ON THE NEED FOR A CARTER.

What a beautiful day it will be—if it ever comes—when one can sit down and write an unqualified eulogy of the equipment of the Flying Services. Nothing would give such joy to the present writer, and yet the day seems as far off as ever.

If one wrote only of the things that are good—and there are many—one would be merely assisting the slackers and intriguers. Every eulogy would be appropriated by them, just as the fulsome eulogies which appear in the daily news-sheets "on high authority" from time to time are inspired by them. And the spirit of "all's well in this best of all possible worlds"—for "worlds" read "Services"—is that most of all calculated to lull the lazy Englishman into a sense of comfortable security, and to encourage him to do as little work as possible.

Every step forward, hitherto, in all Government departments, but specifically in the Flying Services, has been the result of agitation. Every improvement has been the result of a minor revolution in one department or another. As a born and bred Whig of the old school—which in these days really means a case-hardened Tory—I hate revolutions, and revolutionaries themselves are an abomination to me. Therefore, I view all these agitations with regret, for I know that the chief cause of Industrial Unrest, and of some lack of enthusiasm for war, is the result of agitations which have destroyed the people's confidence in their leaders.

The leaders themselves are to blame, for if they had led the people properly, and had appointed efficient subordinates who would have inspired the people with confidence in official ability instead of impressing on them the utter inadequacy of officialdom, the people would have followed their leaders to perdition or to victory with cheerful enthusiasm. As it is, ineffective officials in all grades have destroyed the belief of the people in their leaders, and the task of the really able men is made all the harder, not by agitators, whether German-paid or merely anarchic, but by their own colleagues in official or Service positions.

The people do not mind sacrifices. They do not mind privations. They are not cowards. They are not afraid of their enemies. But they do hate to think that their sacrifices are unnecessary, or useless, and that they are being "sold a pup" by the people who ought at once to lead and serve them. That is the real cause of all this labour unrest, and revolutionary gossip.

The Devil and the Deep Sea.

Therefore, the critic is more or less between the Devil and the Deep Sea. If he cries "peace where there is no peace," and pretends that all is well with our Government departments, he is merely aiding the incompetents to hold down their jobs, and is helping to make inefficiency more inefficient. If he agitates for reforms and for the giving of a free hand to efficient men, he cannot help adding to the spirit of unrest which will become a definite danger to the carrying on of the war unless it is crushed. It may be crushed partially by force of arms, at the price of something very like civil war, but it can be destroyed altogether if we can only find some great leader who will take hold of the reins and inspire the people with confidence and enthusiasm.

The Flying Services are typical of the people and the British Empire as a whole. The world of aviation is a microcosm of the world at large. We have our own agitations, and the same results. One would like to say that all is well, yet one cannot honestly say it, for the reasons stated. And one is forced to agitate and criticise, for here we have Lord Derby, Mr. Lloyd George, and Dr. Addison, all within a week, lamenting that we cannot produce, or rather that we have not produced, enough aeroplanes to supply the Army in the Field, and also Home Defences. And why not, pray? We have the labour and the machinery and the material. More especially we have the designs. Never has it been more true than to-day that we are always six months ahead of the enemy in design and twelve months behind him in delivery. And why are we behind?

Mesopotamia Over Again.

The answer is the answer to the Mesopotamian scandal: lack of preparedness, lack of organisation, reckless optimism on one hand, criminally bad technical advice in another, and through it all personal intrigue. A man tries to aggrandise himself at the expense of another; a department tries to save its face by covering up its mistakes instead of admitting them freely and making good at the next attempt; a clique stores up technical information for its own benefit instead of spreading its knowledge broadcast for the good of the Services; one office disapproves the action of another lest the success of the said action should bring credit and promotion to the originator of the idea; an official condemns the design of a civilian engineer lest the civilian's designs should supersede those for which he himself hopes to win advancement.

And so the miserable game goes on, with the result that the men at the front suffer for it. But now, thanks to that long-suffering star which presides over the destinies of this country, the people at home are beginning to suffer also, with the inevitable consequence that the responsible officials are being badgered to explain why.

Our friends the enemy may yet force us to win the war. A few more really healthy air raids over London and there may be such an upheaval as will finally remove that portion of the population of the Hotel Cecil which has all along been responsible for our constant unpreparedness and for our slowness to rectify our mistakes. Meantime one has to go on criticising.

A TYPICAL EXAMPLE.

Be it said, the responsibility is fairly well spread out over various departments, but primarily the reason for the shortage of aeroplanes is the waste of material and labour which has taken place in the past. The older readers of this paper will remember, for example, the agitation two years and more ago against the waste of labour and material on B.E. biplanes and R.A.F. engines, when better performances could have been got out of other designs which were simpler and cheaper to build.

When I appeared before the Air Enquiry Committee a year ago I asked why, instead of building R.A.F.—B.Es., we did not build Avros, with mono-soupape Gnômes. General Henderson himself distinctly suggested to the Committee in reply to this criticism that mono-Gnômes could not be used in tractor machines. Yet at that moment the R.N.A.S. were using monos. in Schneider-type Sopwiths with marked success, and to-day any R.F.C. officer can tell you all about mono-Gnôme-Avros.

No 90-h.p. R.A.F.-B.E. ever had a performance equal to that of a mono-Gnôme-Avro, even the officially mangled version. No B.E. could ever be built as cheaply in labour and material as an Avro. Also a mono-Gnôme was even then a far cheaper engine to build than a R.A.F., and its cylinders were not classed as consumable stores, as were R.A.F. cylinders. The amount of scrap produced in building Avros and Gnômes was infinitesimal compared with the wastage in B.Es. and R.A.Fs., and yet we built the latter in thousands all over the country. They cost more in labour and material without allowing for wastage, they produced more scrap, they did not climb as well, they were not as fast. Yet we went on building them, and we are still building them to-day. And so we found ourselves without fighting machines to tackle the Fokker scourge of late 1915, without better fighters to tackle the Albatroses of late 1916, and without seaplanes of a kind fit to tackle the submarines of early 1917.

To-day we find ourselves without big bombers to defeat the modern raiders by destroying their bases, and without enough aeroplanes of all sorts to carry war into Germany and influence materially the course of the war. Yet the people of this country, and the Government, have never discovered the reason.

Why? For much the same reason that the Government never discovered the iniquities of the hospitals on the Tigris, although thousands of us here at home knew all about them. Because the Army and the Government, and the tax-payers have been hoodwinked by the technical people, who had to save their faces or lose their jobs. And the same thing is going on to-day, and will go on until the Flying Services produce a Colonel Carter, to do for their technical people what that truly patriotic officer did for the medical people in Mesopotamia.

THE LEAVEN OF RIGHTEOUSNESS.

I am not denying that much excellent work has been done, and is being done by many officers in the technical departments, but the good men are being held down and hampered by others, who are their inferiors in ability even if their superiors in influence or in rank, and until the Air Board takes the whole subject firmly in hand and shakes out the wasters we shall never reach our maximum output of aeroplanes and engines.

All must sympathise with the Air Board's difficulties. Men like Lord Cowdray and Sir William Weir, themselves unacquainted with the details of aircraft construction, cannot go down into that rabbit-warren of officers and find out where the intrigues begin and where the mistakes are made—and hidden. They can only hope for enlightenment when they deliberately lay themselves out to short-circuit the intriguers and hiders of mistakes. And, as I have suggested, they will only succeed in their task when they have succeeded in establishing personal communication with an officer or officers who will tell them the truth about what is going on underneath them, as Carter of Mesopotamia told the truth in spite of menaces and threats from those who knew they would suffer when the truth came out.

ON SOME DIRECTIONS FOR SEARCH.

Possibly it may assist the output of the aircraft, which we admittedly need, if I endeavour to suggest some of the directions in which search should be made if the Air Board is anxious to discover why it does not produce more machines for its expenditure of labour and material. Such suggestions must necessarily be made with due regard to the fact that anything herein written will be read by the enemy, and that, therefore, it is impossible to be very specific. At the same time investigations along the lines indicated may bring valuable results.

We are holding our own in the air abroad, as the enemy well knows, and for that fact we must thank not only the gallantry of our aviators, but the good work done by many people in the production departments at home. That, however, is not enough. We must produce such an air fleet as will overwhelm the enemy in the air and make it impossible for him to spare machines for the invasion of this country.

The more the war progresses the more evident is the truth of General Brancker's dictum to the effect that, though it may be impossible to prevent an enemy from reaching this country if he once starts, it is possible to produce such an air fleet as will prevent him from starting. It is with this object in view that I venture to direct the attention of the Air Board to the following points.

In the first place, no aeroplane, big or small, can fly without an engine. Have we ever had, and are we now getting, our maximum output from our engine factories? Barring the Sunbeam, Beardmore, and Rolls-Royce firms, has any motor factory turned out as many engines fit for war service on aeroplanes as it should or could have done? Has the Air Board considered the amount of first-class labour and material and machinery which has been and still is being wasted in motor factories in turning out inferior or obsolete machines of official or semi-official design?

Why should such a vast number of our active service pilots still be wandering about on 90-h. and 120-h.p. R.A.F. engines, when every Hun pilot can go prancing round the sky on 160-h.p. or 260-h.p. Mercédès or Benz engines? Who is responsible for the refusal of the original Hispano-Suiza offer, and, still more, who is responsible for certain happenings in connection with a revised Hispano-Suiza design ordered in vast quantities in England? And why was it a failure?

Has the Air Board investigated the latter affair, and has it realised its effect on the output of war-engines during the last few months? If so, who has suffered for the mistake, those in comfortable offices who altered or passed the designs, and gave out vast orders for untried engines, or those on active service who have not had the engines which they should have had?

Furthermore, does the Air Board know the whole truth about the material and labour and machinery expended over a certain unsuccessful engine known only by its initials? By whose order or by whose influence was that expenditure incurred? And will officialdom ever dare to make known the truth about the American deal which did *not* fructify. Great credit is due, at any rate, to one official who refused to see that deal through despite pressure from persons unknown and came home unbidden.

If the Air Board knows the inside of those two incidents it may prevent such reckless optimism and such colossal gambling in "futures" in time to come, but someone must pay for the mistakes, and someone should be punished for making them. Yet knowing our official methods it would be surprising if anyone has suffered so far—excepting always the people who want more and better aeroplanes and have not got them.

It sounds very well for Dr. Addison to boast that the number of engines turned out monthly has more than doubled this year already and will be doubled again before the close of the year, but quality is more important than quantity. Can Dr. Addison assure the nation that a proper proportion of these engines is fit for active service and not merely for school work? Here is a useful subject for Dr. Addison's successor, Mr. Churchill, to investigate for a beginning.

Mr. Churchill's Chance.

There is some hope to be found in the fact that aircraft production is largely under the thumb of the Ministry of Munitions, and the appointment of Mr. Churchill to the head of that department leads one to believe that aircraft constructors will have powerful backing in time to come.

Mr. Churchill has his faults, like every other big man, and he has a wonderful collection of enemies, but, at any rate, Mr. Churchill has energy and imagination, and he does not suffer fools gladly, so one may reasonably expect that any such mistakes which may be made in the future will be set right quickly, and that the originators of the mistakes will suffer for them.

Mr. Churchill's keen personal interest in everything concerned with aircraft is practically a guarantee that the sections of the Air Board which come under the Ministry of Munitions will be well looked after. Which ungrammatical sentence has a double meaning, in that one may look after a person in a disciplinary sense as well as looking after his needs and comforts. Short of becoming President of the Air Board there is no position in which Mr. Churchill could influence the output of aircraft so well as he will be able to do in his present office.

Improving Output.

However, to return directly to problems of output. It does not seem that we are using our sources of supply to anything like the best advantage. For example, engine output could certainly be increased if more liberty were given to manufacturers to farm out the making of small parts.

There are plenty of small firms, possessing a few lathes and other machines, who could take on subcontracts for valves, or rockers, or such things, if the bigger firms were allowed to order these parts without official interference, so long as they also took responsibility for their quality.

Aeroplane parts also could be farmed out to a much greater extent, and there is no very evident reason why every little sub-contractor should be afflicted with A.I.D. inspectors and official forms and regulations, so long as the chief contractor has to stand the racket if anything goes wrong.—C. G. G.

THE KING WITH THE R.F.C.—His Majesty talking to General Becke. The Prince of Wales' apparent attitude of critical inspection towards the comic officially-designed aeroplane appears to be wholly justified.

MR. CHURCHILL'S APPOINTMENT.

FROM THE "LONDON GAZETTE," JULY 21ST, 1917.

THE PRIVY COUNCIL.

At the Court at Buckingham Palace, the 20th day of July, 1917.—Present, the King's Most Excellent Majesty in Council.

This day the Right Honourable Winston Leonard Spencer-Churchill was, by His Majesty's command, sworn Minister of Munitions.

ALMERIC FITZROY.

Mr. Churchill's return to the Cabinet has been the subject of much adverse criticism, for, like all strong and energetic men, Mr. Churchill has made many enemies. Also doubtless, he has made mistakes, for there is an excellent old proverb to the effect that the man who never makes mistakes never makes anything else. Nevertheless, the indisputable fact remains that, in so far as aeronautical affairs are concerned, Mr. Churchill's activities have had wholly good results. As First Lord of the Admiralty he grasped the importance of naval aviation, and, despite the opposition of stick and string admirals and parsimonious Treasury officials, he succeeded in giving to this country at the outbreak of war the only effective Naval Air Service in the world. And it was no fault of his that the R.N.A.S. failed to develop along the lines on which he started it.

His efforts in this direction kept the Aircraft Industry alive when, if it had been dependant on the Army, it would have ceased to exist, barring a few obedient firms solely employed on manufacturing to ineffective official designs. It was entirely due to Mr. Churchill's backing at the most critical time of its existence that the Aircraft Industry was able to supply aeroplanes and engines to the R.F.C. when it had been so badly let down by the Royal Aircraft Factory.

Mr. Churchill is himself a capable pilot of aeroplanes, and his quick grasp of new ideas enabled him to appreciate at once the problems of the Air Service. As Minister of Munitions the problems of aircraft supply will come within his purview, and one is encouraged to hope that his early enthusiasm for flying, coupled with his present appreciation of the vital importance to this country of an adequate air fleet, will move him to devote to the production of aircraft all the attention which he can possibly spare from the other duties of his department.

It is probably impossible by now for any human being to evolve order out of the chaos of the Ministry of Munitions, but a policy of Hunnish ruthlessness, in the way of scrapping departmental chiefs who do not make good, may make the Ministry effective even if it can never be made efficient. One has considerable respect for Mr. Churchill's ruthlessness where immediate results are demanded, and, therefore, one has great hopes that he may once more be instrumental in placing this country in a position of pre-eminence where the matériel of air war is concerned.—C. G. G.

AIR RAID WARNINGS.

The test of sirens as a means of giving warning of threatened air raids on London was made on July 17th. Some minutes after 12 o'clock the test began, and it continued until about 12.30 p.m. There seems little doubt that the experiment was not a success, and the general opinion is that some better system of warning must be adopted.

Steamers on the Thames, the fire-tugs, and steam whistles on various factory buildings started first, and their notes were heard by all the people living or working near the river bank. Beyond these limits they were inaudible, and in many parts of the City of London people who had been waiting for the alarm did not hear it at all, owing to the noise of traffic. In office buildings in the City clerks and workpeople did not know that a warning had been sounded, even though they had been waiting for the test.

[It has been suggested that a more practicable system would be the simultaneous ringing for half a minute of every telephone bell in London, and the imposition upon subscribers of the duty of attracting the attention of passers-by to the fact that a raid was expected.

Another suggestion is the fitting of electric motor horns at street corners, to be coupled to telephone wires and sounded from the telephone exchanges. A large number of such horns could doubtless be procured from the owners of cars which have been laid up owing to lack of petrol.—Ed.]

A trial was made on July 20th at the Horse Guards Parade of a new method of signalling the approach of enemy aircraft. At 4.30 p.m. a small crowd gathered near the parade ground, and shortly afterwards the Prime Minister and Lord Derby appeared to watch the tests. With them were Sir George Cave and Lord Milner.

A small brass cannon attached to a length of wood about the size of a railway sleeper was used to fire the detonators, technically known as Sound Signals. These were tried first, and were evidently the most effective. When they leave the cannon they detonate with a loud report, and in the air, at a height of about 200 ft., they explode again with a louder noise than that made by the propulsive charge. There is an interval of five seconds between the first report and the second, and this in itself would constitute a signal.

The other method tried was not such a success. It consists of a rocket fired from a papier-maché mortar, which bursts at a height of about 150 ft., setting free a parachute, from which is suspended a smoke flare, or a series of calcium lights. They made little noise as they left the ground, and but a feeble report reached those listening when they burst in the air.

It was evident that the sound signals were the more effective. Of course people a mile and a half away from the scene of the firing could not hear them, but when the system is properly in swing everyone in London possessed of ordinary hearing will know that the warning has been given. It is proposed that these mortars should be placed on various buildings about the City so that they can be fired by the police or other officials on the approach of enemy aircraft.

In consequence of the arrival of enemy aircraft over the Eastern coast on the morning of July 22nd, London was officially warned through the agency of percussive pyrotechnics that a raid was to be expected. One would imagine that the imitation of an air raid would be *très difficile*, to borrow the expression of the historical French personator. But it was attended with such success that the greater part of the population was absolutely convinced that they were being bombed. In all, 237 rockets were fired from the 79 fire stations in the L.C.C. area, and in all the chain of warnings was spread over a period of about 10 minutes. This auricular notice was supplemented by the display of boards in the hands of, round the necks of, or on the protuberances of policemen.

Although one is inclined to agree that the average person has no right to be in bed at 8.30, there are many circumstances under which one is justified in being asleep at any hour of the day or night, and personally one would like the future notices to be given in a somewhat less distracting way. At the same time, considering Londoners' wilful deafness to advocates of adequate aerial defence in the past, one is quite prepared to sacrifice one's own personal comfort for the solid satisfaction of seeing London forced to listen to aerial agitations—even when officially afflicted.

It might be better if all the signals could be let off simultaneously or in three discharges, as apparently it was intended that each district should be notified thrice. Apparently London was notified 237 times, which seems well on the liberal side.

The many thousands of invalids who have to live in London certainly deserve a little consideration, as do the number of nerve-wracked soldiers who at the present time are helping to fill the hospitals, and one doubts whether the rest of London is worth the discomfort thus caused to them.

PRINCESS MARY'S ESCORT.

The "Star" states that a letter sent to the Mayor of Southend by Sir Edward Wallington, private Secretary to the Queen, contained the following passage:—

"Her Royal Highness was much gratified by the warm welcome she received from the inhabitants and the great number of school-children who lined the streets, while she was greatly interested in the fleet of aeroplanes which escorted the special train during the latter part of the journey."

[One fails to understand all this fuss about Princess Mary's escort. There seems no good reason why young pilots who are not yet fit for active service should not have the honour of escorting the Princess.—Ed.]

THE FUTURE OF THE ROYAL FLYING CORPS.

SOME POSSIBILITIES.—II.

BY "BERKELEY."

Regimental Loyalty.

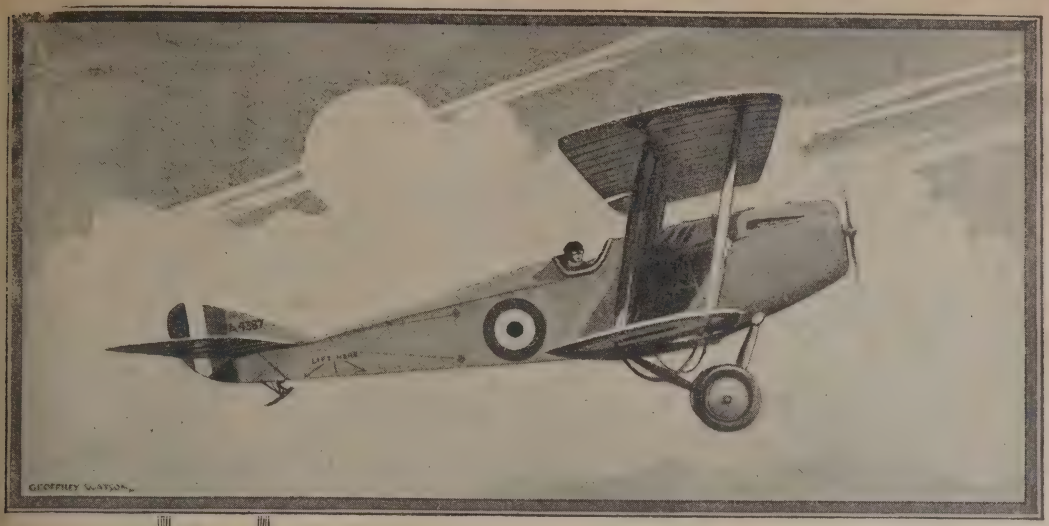
In the early days of the Royal Flying Corps when officers were posted to the unit because of their skill as pilots and when such few as did not need to act as pilots by reason of their rank and appointment invariably underwent such preliminary training in aviation as would qualify them for the Royal Aero Club's aviator's certificate, there was but little permanency in the officer personnel. In other units of the Army, officers who joined from Sandhurst or Woolwich did so in the majority of cases with the intention of spending the greater part of their professional career in their chosen corps, interspersed though the period of service might be with a few years of work on the General Staff if it so chanced that their ability or inclination led in that direction. To an officer his regiment or corps was his home, to be ever regarded with that true affection that attaches to the things of splendid tradition. Only when promotion to the rank of general officer extended the area of their work did they leave the regiment in which their life, during its most impressionable period, had been spent.

With the Royal Flying Corps all was different. While officers were chosen because they were pilots, and while all such piloting was entrusted to officers, the period of individual service was limited by the continuance of the wish and the power to fly. Officers were seconded or attached for a period of four years because it was deemed that such would be the probable duration of a man's nerve under the strain of constant flying. No officers were posted to a permanent cadre. The majority came from other branches of the Regular Army, whilst a few were taken by direct entry from civil life and were given commissions in the Special Reserve of Officers. A few of this latter class were embodied for their entire period of service and the remainder came up for training during a part of each year.

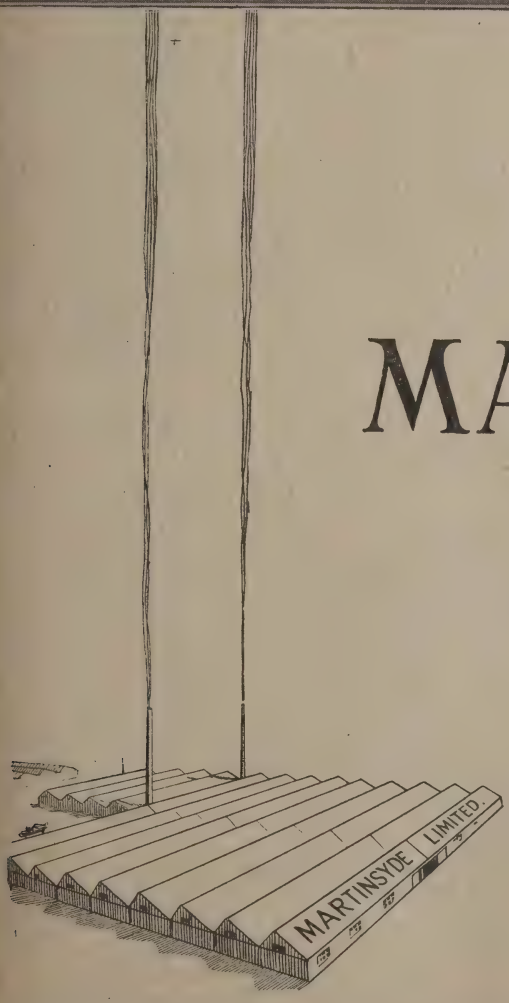
Changing Personnel.

Thus the Royal Flying Corps would, but for the intervention of the war, have been officered with a constantly changing personnel. The system had a few advantages. The officers selected were in most cases young and enthusiastic. Also it followed that when or if an officer tired of so strenuous a unit he could return to his regiment and continue his temporarily interrupted career without loss of seniority or prestige. On the other hand, there were the obvious disadvantages of lack of continuity and of the temptation to officers to regard their service in the Royal Flying Corps as merely a brilliant and exciting interlude in an otherwise well-ordered life.

If it be admitted that the work of piloting can be carried out adequately by N.C.Os. and rank and file, then the great difficulty in the way of posting officers permanently to the corps is removed. The officers required to lead in the air can be found with ease from the mass required to administer and maintain the Royal Flying Corps. When an officer ceases to care for flying, and the decay of such affection will become less and less in the future just as the child-horse of the present day no longer regards motor-cars with dislike tempered by fear, he would be employed in innumerable other ways without leaving his own branch of the Service. Equipment officers, adjutants and such like impedimenta could then be found within the corps and without the necessity of going humbly clothed into the highways and hedges and begging for candidates. Moreover, the Royal Flying Corps would become a career instead of an interlude in a life.



There is little question that the Royal Flying Corps, unless, indeed, it be merged in the great single Air Service, so beloved of the politician out of office, will, when the war ceases, be reorganised in some manner similar to that suggested above. But with the renewal of peace it is unlikely that the previous methods of selection will obtain. The recruiting of the commissioned ranks by direct entry, a method which has been necessary if the Royal Flying Corps were to continue to exist at all, can hardly continue in later days. It is in itself a reversion to a system which was abandoned in the early days of the nineteenth century when the necessity of the higher training of officers became apparent. Professional training is not likely to become less necessary in the future!



A Third Academy.

It is equally unlikely that any system of isolated Royal Flying Corps would be satisfactory—that some third academy similar in intention to those at Woolwich and Sandhurst could be founded with success. The scheme of training in being at the existing military colleges is directed towards the creation of such virtues of the officer caste as it is possible to inculcate by precept and example as well as to the giving of preliminary instruction in military science. It could only be of advantage to the Royal Flying Corps if that unit found its officers in exactly the same way as does the cavalry or the infantry. The two year course in a military college is a sufficiently firm foundation for a career in any branch of the King's Service. Cadets desiring to enter the Royal Flying Corps could pass into Woolwich—the cradle of the commissioned ranks in the scientific arms—as do those who propose to become gunners or sappers. On the conclusion of the necessary number of terms the cadet would be posted to a squadron of the Royal Flying Corps stationed at home where he would begin his special training into the mysteries of practical military aeronautics. When the R.F.C. has its own permanent cadre, service with a line battalion, which at one time appeared to be a desirable system to support, would be quite unnecessary, as there would be no difference in the spirit of the life in the Flying Service or in any other unit of the Army.

A Regular Cadre.

Once the system of appointment and the individual duration of service alters in the Royal Flying Corps its relation to the remainder of the Army changes fundamentally. At present officers, as has been shown above, are either seconded to the unit, are attached, or are borne in the Special Reserve. There is no regular cadre. Therefore, it is all in a sense special service, and any officer in the Royal Flying Corps desiring to be employed in any outside capacity, either with another unit or on the General Staff, would of necessity relinquish his connection with the Flying Service. There can only be loss in such a system. When officers are posted to a regular cadre of the Royal Flying Corps they will in due course, if they so desire, be eligible for entry to the Staff College, and can be seconded for service on the Staff or in any unit they may desire. The broadening of outlook consequent on such a change cannot but be of advantage.

The Limitations of the R.F.C.

Under present conditions, when an officer (direct entry) of the Royal Flying Corps reaches the rank from which he is eligible for promotion to general officer, he is little fitted by his training to take command of, say, an infantry brigade, and is, in fact, only suitable for a brigade in the Royal Flying Corps itself. This is a limitation which can only be passed by genius, and genius is very rare in a workaday world. The principle which has brought the British Army to its position of eminence is much more catholic in its scope. Sir Douglas Haig is a cavalry man, the Earl Roberts was an artillery man, and the Duke of Wellington passed his early days in the finest school of all—the infantry of the line. There are many reasons in favour of the Royal Flying Corps producing general officers of singular ability. The very nature of their warlike duties, if taken in the right way, gives the young officer a deep insight into the workings of the different arms of the Service throughout a campaign. There is no branch save the General Staff which is brought into such close contact with each of the great bodies of the Army in peace or in war. The artillery relies on the R.F.C. for observation, the cavalry is allied with it in observation, and its maps and information are essential to the infantry at all times. The reorganisation of the Royal Flying Corps that it may be similar in general outline to, for instance, the Royal Regiment of Artillery, would make it possible for these inherent advantages to be used in the production of leaders of armies from those who attained distinction in earlier life as leaders of flights or squadrons.

Temporary Attachment.

After the change it would also be possible for R.F.C. officers to be attached to other arms of the Service, that knowledge of other people's difficulties may be acquired. The system of allowing officers to serve for brief periods with units of a different category has never been developed as it might well have been. The higher command and countless Royal Commissions have recommended it, but like most things of use to the Army, public apathy in time of peace has prevented any adequate trial. Watching another man at his work rarely creates sympathy, but the necessity of assisting that man in his labours entirely alters all conditions.

The Special Reserve.

The Special Reserve of the Royal Flying Corps would alter but little. As in other units it would serve for draft finding in time of war. Many of the officers now in the Special Reserve would, no doubt, be transferred to the Regular Service at the end of the war, leaving the nucleus of a real reserve unit. A few weeks' service in each year would be sufficient to keep such officers in touch with the progress of aeronautics and the development of military science, and would also indicate the inefficiency of those others whose interest and keenness had disappeared. Those officers who, on retirement from the Regular branch of the Royal Flying Corps had remained on the Reserve of Officers might also, with advantage, be invited to share in a routine annual training, though officers of this class would be most useful on emergency in positions of administration and in the training of the newly joined officers.

The Making of Tradition.

But in whatever manner the change may come there is no question that it will come. It may be that all surmise is in vain and that a new single air Service will sweep the existing corps out of existence. It may be so, and there will be many who will regret it. One thing is, however, certain. Younger than any other of the great corps of the Army, it has in its brief career acquired such merit that its tale will never be forgotten while England exists. Those who have died that its tradition might live, and those who work to-day that its name may ever be clean and great, will reap their reward in the future gratitude of that body, of which it has proved itself a worthy unit, the British Army.

TIMBER FROM NORTH AMERICA.

It is announced by the Controller of Timber Supplies that the following relaxations of the restrictions on the import of timber from North America have been arranged:—

(1) Neutral Sailers.—Timber may be imported from Canada and the United States of America under the usual procedure as regards import licences.

(2) Deck Loads.—A general licence has been granted by the Department of Import Restrictions for the importation of timber as deck cargo from Canada and the United States of America. In this case it will not be necessary for importers to apply for licences.

(3) Prices.—The orders which limit the prices of imported softwood to those current during the last week of January, 1917, will not apply to timber imported from Canada and the United States after July 19th, 1917.

Timber so imported may be sold by the importers at its cost price, delivered to store, plus 10 per cent., provided that the price so calculated does not exceed by more than a third the price current during the last week of January, 1917, for softwood of similar quality and description in the same locality. It may be sold by persons other than the importers at prices which are in accord with the foregoing proviso.

AN ECCLESIASTICAL INSCRIPTION.

It is reported that the War Office has presented the Rector of South Hackney (the Rev. B. S. Batty) with a very fine section of the "Zeppelin" which was brought down at Cuffley. This has been placed in the west end of the nave of the church, and a printed inscription bears the following:—"Portion of the Zeppelin brought down at Cuffley, September, 1916, after voyaging over South Hackney. Presented by the War Office to South Hackney Parish Church. For the skill and courage of our airmen, we praise Thy Name, O Lord"

[The fact that people still insist upon installing the Almighty as patron of war shows that we are still many leagues away from real civilisation. The suggestion that Jehovah is to be praised for supplying one set of men with the skill and bravery necessary to overcome another set of men also endowed with skill and bravery, seems to indicate that our State religion is still that of the elemental Semitic tribes. And, anyhow, why thank Jehovah for a Zeppelin which was a Schütte-Lanz?—Ed.]

AN EDUCATIVE EFFORT.

The War Office has arranged for distinguished Flying Corps officers to visit aeroplane factories and tell the workers something of the service which their machines are doing at the front. It is hoped that these informal lectures will link together the men and women of the factories with the men who use what they have made. Trade Union officials, shop stewards, and every class among the workers are alleged to be immensely interested. The lecturers have been impressed by the intelligence of their audiences and their keerness to know. The idea has already been mentioned in connection with the Aeronautical Society.

A DUBIOUS PRECAUTION.

A Royal Proclamation published in the "London Gazette" for July 17th prohibits the exportation from the United Kingdom of drawings, designs, specifications, and other descriptions in writing of any kind of aeroplanes or other aircraft or of engines or other accessories of aircraft.

The order is good, in that it may prevent reckless circulation of our new ideas to Allied countries, whence, or en route to which, they might get into the hands of the enemy. But there is a serious objection in that it prevents free trade in designs between British and American designers, and leaves too much power in the hands of minor officials who may use it to their own advantage. Permission to send a new design abroad might be hampered by intrigue, and so prevent the improvement of American aircraft.

AEROPLANE CONSTRUCTION.

Educated women between 18 and 35 years of age are wanted to take a short course of free training in important work urgently needed. Applicants should call on or write to:—Women's Service, 58, Victoria Street, S.W.1. Hours, 10—1.30, except Saturday.

The Wonderful Properties

of Triplex Safety Glass have made it a commercial necessity in every branch of automobile and aeronautical engineering. Absolutely unsplinterable; cannot "fly" if broken, and yet is as clear as plate glass.

* * *

The King has been pleased to approve of the award of the Military Cross to the following Officer:—

Capt. John Palethorpe, R.F.C.

During a recent hostile air raid Capt. Palethorpe, with 1st Cl. Air Mech. J. O. Jessop, R.F.C., as Gunner, was engaged in an endurance trial from a testing squadron.

When about three miles from the coast a formation of 17 enemy aeroplanes was sighted. Capt. Palethorpe at once attacked with great courage and determination, under very heavy fire, till the Gunner was killed.

He then landed, and having procured another Gunner, endeavoured to renew the attack.

* * *

Mentioned in Dispatches for gallant and distinguished services in connection with recent enemy air raids:—

No. 25501 1st Cl. Air Mec. James Oliver Jessop, R.F.C. (killed in action).

War Office, July 18th.

The King has been pleased to award a second Bar to the Distinguished Service Order to:—

Capt. Charles Edgar Bryant, D.S.O., Lrs. and R.F.C.

He has displayed the utmost gallantry and skill in leading photographic reconnaissances. In spite of overwhelming opposition by hostile aircraft, he has never failed to carry out his difficult task. (D.S.O. gazetted Feb. 18th, 1915.)

* * *

The King has been pleased to approve of the appointments of the following Officers to be Companions of the Distinguished Service Order in recognition of their gallantry and devotion to duty in the field:—

Lt. (temp. Maj.) Leonard Wright Learmount, M.C., Gen. List and R.F.C., Spec. Res.

He has shown great skill and determination when on photographic reconnaissances. Despite continuous fire from the ground and attack from hostile aircraft, he has repeatedly effected a safe landing after completing his task.

Temp. Lt. (temp. Capt.) Charles Frederick Algernon Portal, M.C., Spec. Res., and R.F.C.

For many months he has done magnificent work in co-operation with the artillery. During an attack he succeeded in silencing nine active hostile batteries, ranging our artillery. His splendid example has been of the greatest value.

* * *

The King has been pleased to award a Bar to the Military Cross to the following Officers:—

Temp. Sec. Lt. William George Barker, M.C., Gen. List and R.F.C.

He has done continuous good work in co-operation with the artillery, and has carried out successful reconnaissances under most difficult and dangerous conditions. (M.C. gazetted Jan. 10th, 1917.)

Capt. Francis Richard Cubbon, M.C., Ind. A, attd. R.F.C.

When acting as an observer on an offensive patrol, he displayed great skill and courage against superior numbers of the enemy. Throughout the action he backed up his pilot with a remarkable display of marksmanship. (M.C. gazetted in this "Gazette.")

Lt. (temp. Capt.) Frederick James Harry Thayre, M.C., R.F.C., Spec. Res.

When in command of an offensive patrol he showed fine leadership and skill, being personally responsible for bringing down three hostile machines. His coolness and courage enabled his small command to inflict severe losses on numerically superior forces. (M.C. gazetted in "London Gazette" of July 18th.)

* * *

The King has been pleased to confer the Military Cross on the following Officers in recognition of their gallantry and devotion to duty in the field:—

Lt. James Dacres Belgrave, Oxf. and Bucks L.I. and R.F.C.

On at least five occasions he successfully engaged and shot down hostile aeroplanes, and has consistently shown great courage and determination to get to the closest range; an invaluable example in a fighting squadron.

Sec. Lt. Maurice Arthur Benjamin, R.F.C, Spec. Res.

He helped to attack two large hostile machines, one of which was seen to crash to the ground. Previously he helped to engage three hostile scouts, one of which was destroyed and the remainder dispersed. He has helped to destroy four hostile machines in all.

Sec. Lt. Edwin Leslie Bishop, Worc. R., Spec. Res., attd R.F.C.

When engaged with another pilot in taking important photographs, they were attacked by a superior number of hostile machines. The other pilot was forced to land, and he himself was driven down close to the ground; but, despite the presence of the hostile machines, he climbed once more and succeeded in taking a large number of most valuable photographs.

Sec. Lt. Charles Edward Blayney, R.F.C., Spec. Res.

For conspicuous gallantry and skill on many occasions in successfully bombing stations and trains at very low altitudes. He has at all times displayed the greatest bravery and skill.

Capt. Cyril Marconi Crowe, R.F.C., Spec. Res.

For conspicuous gallantry and skill as a leader of offensive patrols, many times attacking hostile formations single-handed, and descending to low altitudes under heavy anti-aircraft fire. He has been responsible for the destruction of several enemy machines.

Capt. Francis Richard Cubbon, I.A., attd. R.F.C.

He has shown great pluck and determination when acting as observer, on several occasions displaying fine marksmanship and coolness against superior numbers of the enemy.

Temp. Capt. Harold Fowler, Gen. List and R.F.C.

He has done invaluable service in co-operating with the artillery. On one occasion he descended to 300 ft. and turned our guns on to parties of hostile troops. During the advance he was able to furnish much valuable information.

Temp. Sec. Lt. Cecil Stuart Goodfellow, Gen. List and R.F.C.

He has done valuable and consistent good work in co-operating with the artillery. He has carried out numerous patrol flights under most adverse weather conditions, and has set a splendid example to his squadron throughout.

Lt. (temp. Capt.) Lionel Thomas Nutcombe Gould, R.A. and R.F.C.

He has done consistent, good, and valuable work while co-operating with the artillery, often under most difficult conditions. He always set a splendid example by his exceptional pluck and determination.

Temp. Sec. Lt. (temp. Capt.) John Benjamin Graham, Gen. List and R.F.C.

He has displayed great skill and courage when leading photographic reconnaissances. On many occasions, although attacked by superior numbers, he, by his courage and determination, has succeeded in completing his reconnaissances.

(Private Branch Exchange)

Temp. Sec. Lt. (temp. Capt.) Robert Gregory, Conn. R., Spec. Res., attd. R.F.C.

On many occasions he has, at various altitudes, attacked and destroyed or driven down hostile machines, and has invariably displayed the highest courage and skill.

Temp. Sec. Lt. William Henry Gunner, Gen. List and R.F.C.

While on offensive patrol he engaged and attacked nine hostile aircraft, two of which were attacking the rear machine of his patrol. Having convoyed the other machine back to the aerodrome, he again returned with his patrol in response to an urgent call for aeroplanes to drive off hostile aircraft. He had been wounded in his previous encounter, but insisted on carrying on, and on numerous other occasions he has shown great skill and courage in offensive work.

Sec. Lt. Reginald Theodore Carlos Hoidge, R.G.A., Spec. Res. and R.F.C.

On many occasions he has attacked and destroyed or driven down hostile machines, and has taken part in 24 offensive patrols. In all combats his bravery and skill have been most marked.

Temp. Lt. Richard Neville Kenward Jones, Gen. List and R.F.C.

He has done consistent good work in the taking of photographs under very adverse weather conditions. By his perseverance and determination he has set a very high standard of efficiency in the photographic work of his squadron.

Sec. Lt. Arthur Gordon Jones-Williams, Welsh R. and R.F.C.

He has continuously shown the utmost dash and gallantry in attacking superior numbers of hostile machines. On one occasion he attacked 12 hostile scouts and succeeded in destroying one and driving down another.

Sec. Lt. Douglas Stewart Kennedy, R.F.C., Spec. Res.

While on a close patrol he attacked three hostile scouts and succeeded in dispersing them. A second formation of four enemy machines then attacked, but these were also dispersed, two of them being driven down. The result of these combats was largely due to his skill and determination.

Temp. Sec. Lt. Reginald George Malcolm, Gen. List and R.F.C.

He has shown exceptional skill and courage in aerial fighting. He has several times been attacked by superior numbers, and on each occasion has accounted for more than one of the hostile machines and effected a safe landing himself.

Temp. Capt. Eyde Rolleston Manning, Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty when conducting photographic reconnaissances. On one occasion he obtained successful photographs though attacked by eight hostile machines, and he has on all occasions displayed the utmost pluck and gallantry.

Sec. Lt. (temp. Capt.) Kenneth Campbell McCallum, Arg. and Suth'd Highrs., Spec. Res., and R.F.C.

When engaged in escorting a formation of bombing machines he attacked four hostile aircraft, bringing down two of them. While fighting these he was attacked by a large hostile formation, which completely surrounded him. Although badly wounded in the foot he succeeded in effecting a safe landing behind our own lines.

Sec. Lt. Lewis Laugharne Morgan, Welsh R., attd. R.F.C.

He crossed the lines at a height of under 100 ft. and destroyed a hostile kite balloon. Previously he attacked a hostile scout at close range, and brought it down in flames. He has shown great gallantry in many combats.

Lt. Charles Allen Parker, R.F.A., Spec. Res., and R.F.C.

When on a photographic reconnaissance he was attacked by hostile scouts, and his observer was severely wounded. He effected a landing near our front line, and carried his observer clear of the machine, which was heavily shelled the entire time, and had burst into flames.

Sec. Lt. (temp. Capt.) Leslie Hurst Peter, R.E. and R.F.C.

When leading a reconnaissance his formation was attacked by hostile scouts. He kept his machines together and carried out a successful photographic reconnaissance despite a strong attack. To his leadership and initiative were largely due the success of the patrol.

Temp. Sec. Lt. William Thomas Price, R. War. R. and R.F.C.

His machine being disabled by hostile fire, and his gun out of action, he managed by skilful handling to effect a safe landing, thus saving the machine and his passenger from capture. He has previously done fine work against hostile aircraft.

Sec. Lt. Arthur Percival Foley Rhys-Davids, R.F.C., Spec. Res.

On many occasions he has shot down hostile machines and put others out of action, frequently pursuing to low altitudes. On all occasions his fearlessness and dash have been most marked.

Lt. (temp. Capt.) Edward Arthur Beckton Rice, R.F.C., Spec. Res.

For conspicuous gallantry and devotion to duty when leading photographic reconnaissances. Though repeatedly attacked, he led the formation to its objective on every occasion with the utmost skill and determination, and has set a very fine example of leadership in no less than 11 successful operations.

Sec. Lt. Alfred Scott, R.F.A. and R.F.C.

For conspicuous gallantry and devotion to duty in personally laying a telephone wire under machine-gun fire after his two telephonists had been wounded. He afterwards returned under heavy fire to the wounded men, got them under cover, and dressed their wounds.

Temp. Sec. Lt. (temp. Capt.) John Kenneth Summers, Gen. List and R.F.C.

He had continuously performed valuable work in co-operating with the artillery. He has on many occasions flown at a very low altitude in order to give information to the infantry, which has proved of the utmost value.

Lt. (temp. Capt.) Frederick James Harry Thayre, R.F.C., Spec. Res.

He has consistently displayed great dash and skill and determination when acting as a pilot in bombing raids. His fine offensive spirit and determination to close with the enemy has set a splendid example to his squadron.

Temp. Capt. Anthony Herbert William Wall, Midd'x R. and R.F.C.

As an observer he has on several occasions assisted to bring down hostile machines. His coolness and accurate shooting have helped very largely in aerial combats.

Temp. Sec. Lt. Edmond Percy Wilmot, Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty whilst co-operating with artillery. On one occasion he successfully ranged a siege battery on an enemy gun position in very bad weather, which necessitated flying at a very low altitude, during which he was subjected to an intense fire.

Australian Imperial Force.—Sec. Lt. (temp. Capt.) Wilfred Ashton McCloughry, Aus. L. Horse, attd. R.F.C.

On many occasions he has displayed the highest courage and skill in successfully bombing stations and trains, often at very low altitudes, and has always given a fine example of energy and determination.

Canadian Force.—Capt. Joseph Achille le Royer, Can. Infy. and R.F.C.

He has constantly shown great skill and courage when acting as observer. His accurate shooting and coolness under fire have largely contributed to his successful aerial combats against superior numbers.

* * *

His Majesty the King has been pleased to award the Military Medal for bravery in the field to the following Non-Commissioned Officer and Men :—

12867 2nd Cl. Air Mech. A. J. Acock, R.F.C.
6509 1st Cl. Air Mech. G. A. Beardmore, R.F.C.
44350 2nd Cl. Air Mech. F. C. King, R.F.C.
50120 2nd Cl. Air Mech. H. Potter, R.F.C.
9566 Cpl. F. H. Squire, R.F.C.
13554 1st Cl. Air Mech. R. H. Thomas, R.F.C.
5075 1st Cl. Air Mech. J. D. Wynne, R.F.C., attd. R.F.A.

War Office, July 18th.

The Secretary of State for War has received a dispatch dated Salonika, March 29th, 1917, from Lieutenant-General G. F. Milne, C.B., D.S.O., Commanding in Chief, British Salonika Force.

The following mention " for distinguished services during the past six months " is made of officers and men of the Flying Services :—

Royal Naval Air Service.

Smyth-Pigott, Lt. (actg. Squad. Comdr.) J. R. W., D.S.O.

Royal Flying Corps.

Dawes, Maj. (temp. Lt.-Col.) G. W. P., D.S.O., R. Berks. R.; Cleghorn, Lt. (temp. Maj.) A., R.E.; Wise, Lt. (temp. Capt.) C. W., A.S.C., Spec. Res.; Gardner, Lt. (temp. Capt.) G. D., York. R.; Birch, Sec. Lt. (temp. Capt.) W. L., W. York R.; Nevill, Sec. Lt. (temp. Capt.) S. S., Spec. Res.; Scott, Lt. W. S., M.C., Lan. Fus.; Saunders, temp. Lt. F. G., Gen. List; Wilson, temp. Lt., J. R., R. E.; Leigh, Sec. Lt (temp. Lt.) J. W. D., Cyc. Bn.; Scholtz, Sec. Lt. H., R.F.A., Spec. Res.; Broadway, Sec. Lt. J. H., Dorset R.; Bamford, temp. Sec. Lt., J. L., Gen. List.

Tansley, No. 740 Flt. Sgt. R. J. C. (decd.); Alcock, No. 2832 Sgt. A.; Yates, No. 2454 Cpl. T. M.; Wood, No. 28309 1st Cl. Air Mech. W. T.; Ledger, No. 8073 1st Cl. Air Mech. W. H.; Parkhurst, No. 3745 1st Cl. Air Mech. W. E.; Wolfe, No. 2372 1st Cl. Air Mech. W.

SPEED UP YOUR OUTPUT!

QUICK DELIVERIES OF ALL TYPES OF AIRCRAFT PARTS.

FOR OUR ILLUSTRATED STOCK AND QUOTATION LIST SEE

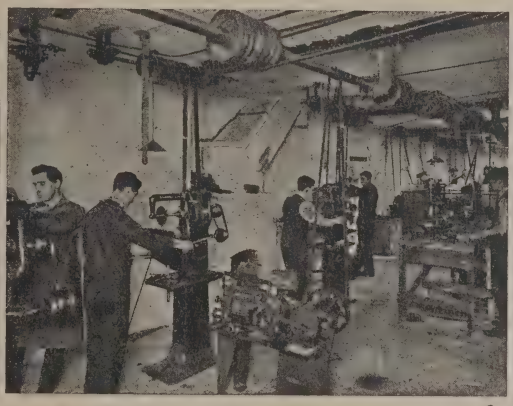
"AIRCRAFT SUPPLIES"

OUR FORTNIGHTLY HOUSE JOURNAL.

PUBLISHED fortnightly, on alternate Thursday evenings, and issued FREE to the Air Services and to the Aircraft Industry (those in charge of Stores and other Works or Service Departments ONLY), on application to the Secretary.

CONTAINS a complete LIST OF STOCK of Aircraft Parts up to the time of going to press, CURRENT PRICES, details of NEW ITEMS, ENQUIRY BUREAU, and other A.S.C. announcements. A SHORT ARTICLE will also appear in each issue on a topic of interest to Aircraft Constructors.

STOCK LIST contains over 400 items.



SPECIAL AIRCRAFT AND ENGINE PARTS.

We can quote by return for Special Parts, on receipt of Blue Prints. Quick Delivery!

Standard "A.G.S." and other parts are stocked for Immediate Delivery

SEND US A COMPLETE LIST OF YOUR REQUIREMENTS, AND WE WILL RETURN THIS TO YOU IN COURSE OF POST WITH THE PRICES MARKED AGAINST THOSE ITEMS WE CAN SUPPLY FROM STOCK, OR DELIVER QUICKLY.

IT WILL PAY YOU TO GIVE THIS SYSTEM A TEST!

One of the Shops in the "ASCOL" WORKS, Holborn, W.C.

NOTICE.

Owing to the August Holidays, the next issue of "Aircraft Supplies" will not appear until Thursday, August 16th.

Special Stock Letters will, however, be sent to all Manufacturers and Storekeepers, giving prices and quantities of parts in stock for immediate delivery on Wed., July 25th, Wed., Aug. 1st, and Sat., Aug. 11th.

Copies will be sent on request.

"The A.G.S. Book"

By BERNARD ISAAC.

CONTENTS.

CHARTS of A.G.S. Rafwires, Tie Rods and Joints, Nuts, Bolts, etc.—Metric Equivalent Charts—Numerical & Alphabetical List of A.G.S. Parts — Screw Thread Systems—A.G.S. Standard for Bolt Heads and Nuts — Photographs, Drawings and Dimensions of all important A.G.S. Parts—A.G.S. Fits and Limits, etc., etc., etc.

130 Pages. Over 230 Illustrations.

ISSUED FREE to approved applications from the Air Services and the Aircraft Industry (Commanding Officers, Officers in charge of Stores, Principals and Heads of Departments ONLY). Persons connected with the Aircraft Industry should make application through their firms. Applications from the Air Services should be made through the Commanding Officer. One copy is supplied free to each firm, and additional copies (cloth paper cover) may be obtained at 2 6 each, the whole of the proceeds, without deduction, being given to The Royal Aero Club Flying Services Fund.

APPLICATIONS must be made on the special forms which may be had from The Aircraft Supplies Co. Ltd., 166, PICCADILLY, LONDON, W.1.

TOOLS.

We have now opened a Department for the supply of all kinds of Engineers' Tools for Aircraft Construction. For details of Stock see 'Aircraft Supplies."

War Office, July 20th.

Memorandum.—Brevet Colonel (temporary Brigadier-General) W. S. Brancker, R.A., to be temporary Major-General whilst employed as Deputy Director-General of Military Aeronautics, June 22nd, 1917.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Sqdn. Comdrs.—Lt. (temp. Capt.) S. H. B. Harris, Spec. Res., from a Flt. Comdr. and from a Group Instr. in Gunnery (graded as Flt. Comdr.), and to be temp. Maj. whilst so empld., Feb. 17th. From Flt. Comdrs. and to be temp. Majs. whilst so empld. :—Lt. (temp. Capt.) R. T. Leather, Yeo., T.F., Feb. 20th. Capt. M. McB. Bell-Irving, D.S.O., M.C., Spec. Res., April 7th. Maj. A. S. W. Dore, Worc. R., T.F., from a Flt. Comdr., May 7th. From Flt. Comdrs. and to be temp. Majs. whilst so empld. :—Lt. (temp. Capt.) A. M. Wilkinson, D.S.O., Hamps. R., T.F., May 10th. Capt. A. B. Adams, Spec. Res., June 20th. Capt. C. W. Anstey, S. Wales Bord., June 28th.

Flt. Comdrs.—From Flying Officers and to be temp. Capts. whilst so empld. :—Sec. Lt. B. A. Peck, R.F.A., Spec. Res.; temp. Sec. Lt. G. A. Maclean, Gen. List, June 1st. Temp. Capt. R. F. Stapleton-Cotton, Gen. List, from a Flying Officer, June 16th. From Flying Officers and to be temp. Capts. whilst so empld. :—Lt. G. D. F. Keddie, Lond. R., T.F.; temp. Lt. G. K. Palmer, Gen. List; Sec. Lt. J. S. Shaw, Spec. Res., July 1st. Sec. Lt. G. L. Lloyd, Yeo., T.F., July 6th. Temp. Lt. A. Roulstone, Gen. List; temp. Sec. Lt. A. Bell-Irving, Gen. List, July 7th. Sec. Lt. H. H. McL. Fraser, Spec. Res.; Sec. Lt. G. H. Hooper, R.E., T.F., July 9th.

Group Instrs. in Gunnery (graded as Flt. Comdrs.).—Capt. J. H. C. Minchin, Sco. Rif., a Flt. Comdr., from a Wing Instr. in Gunnery (graded as a Flt. Comdr.), vice Sec. Lt. (temp. Capt.) W. G. B. McKechnie, R. Sc. Fus., who reverts to Flying Officer and temp. Lt., Jan. 17th (substituted for notification in "Gazette" of March 13th). From Wing Instrs. in Gunnery (graded as Flt. Comdrs.).—Sec. Lt. (temp. Capt.) M. R. N. Jennings, Spec. Res., and to retain his temp. rank whilst so empld., vice Sec. Lt. (temp. Capt.) R. G. Heyn, Spec. Res.; temp. Capt. C. O. F. Modin, D.S.O., Gen. List, vice Capt. D. E. Ward, Lond. R., T.F., June 5th. Sec. Lt. (temp. Capt.) A. P. Hartley, Ches. R., T.F., from a Wing Instr. in Gunnery, graded as an Equipment Officer, 1st Cl.), and to retain his temp. rank whilst so empld., vice Capt. J. H. C. Minchin, Sco. Rif., who reverts to Flt. Comdr., June 30th.

Wing Instr. in Gunnery (graded as a Flt. Comdr.).—Sec. Lt. (temp. Lt.) R. C. Hardie, D. of Corn. L.I., Spec. Res., a Flying Officer, and to be temp. Capt. whilst so empld., vice temp. Capt S. E. Adams, Gen. List, who reverts to a Flying Officer and the rank of temp. Sec. Lt., March 15th.

Instrs. in Gunnery (graded as Equipment Officers, 1st Cl.).—Temp. Capt. C. B. Tidmarsh, Gen. List, a Flying Officer; Capt. H. E. F. Wyncoll, Notts and Derby R., from a Group Gunnery and Armament Inspr., March 22nd. And to be temp. Capts. whilst so empld. :—Sec. Lt. G. H. Higginson, N. Lan. R., T.F., and to be secd., vice temp. Capt. W. H. Miles, Gen. List, April 18th. Temp. Lt. J. D. Hodgson, Ches. R., and to be transfd. to Gen. List, May 1st. Temp. Sec. Lt. (on prob.) W. M. Groom, Gen. List, and to be confirmed in his rank, May 16th. Temp. Lt. C. C. Watts, K.R. Rif. C., and to be transfd to Gen. List; temp. Sec. Lt. B. Elliott, Gen. List, May 23rd. Temp. Sec. Lt. A. Haywood, R. War. R., and to be transfd. to Gen. List; Sec. Lt. (on prob.) G. F. P. Warren, Spec. Res., June 1st. Temp. Maj. G. P. Myers, Mach. Gun Corps; Capt. A. M. Lester, Lond. R., T.F., from a Cyclist Corps; Capt. D. E. Ward, Lond R., T.F., from a Group Instr. in Gunnery (graded as an Equipment Officer, 1st Cl.), June 5th. From Instrs. (graded as Equipment Officers, 1st Cl.), School of Aerial Gunnery :—Temp. Capt. F. G. Wilson, Gen. List; temp. Sec. Lt. (temp. Capt.) S. W. Cooper, Gen. List, and to retain his temp. rank whilst so empld., June 5th. From Wing Instrs. in Gunnery (graded as Flt. Comdrs.) :—Temp. Capt. S. H. Bird, Gen. List; temp. Capt. H. E. Dixon, Gen. List; Sec. Lt. (temp. Capt.) A. P. Davidson, High. L.I.; Sec. Lt. (temp. Capt.) H. J. Brewster, Midd'x R.; Sec. Lt. (temp. Capt.) C. H. Stokes, Spec. Res.; Sec. Lt. (temp. Capt.) A. P. Hartley, Ches. R., T.F.; temp. Sec. Lt. (temp. Capt.) P. A. Moodie, Gen. List; Sec. Lt. (temp. Capt.) R. C. Hardie, D. of Corn. L.I., Spec. Res., June 5th; and to be temp. Capts. whilst so empld. :—Lt. F. R. Alford, M.C., Canadian Inf., from an Asst. Instr. (graded as an Equipment Officer, 2nd Cl), School of Aerial Gunnery; Sec. Lt. (temp. Lt.) D. H. S. Davies, R. War. R., a Flying Officer; temp. Sec. Lt. R. C. Beddie, Gen. List, an Equipment Officer, 3rd Cl., June 5th. Temp. Lt. L. J. Gulliver-Cradwick, Essex R., vice temp. Sec. Lt. (temp. Capt.) P. A. Moodie, Gen. List, who reverts to Flying Officer, and relinquishes the rank of temp. Capt.; temp. Lt. H. F. Alton, Gen. List, from an Asst. Instr. (graded as an Equipment Officer, 2nd Cl.), vice Sec. Lt. (temp. Capt.) C. H. Stokes, Spec. Res., who reverts to Flying Officer, and the rank of Sec. Lt.; temp. Sec. Lt. L. P. Hoult, Gen. List, from an Asst. Instr. in Gunnery (graded as an Equipment Officer, 3rd Cl.); Sec. Lt. (on prob.) (temp. Lt.) L. A. Price, Spec. Res., from an Asst. Instr. in Gunnery (graded as an Equipment Officer, 2nd Cl.), vice temp. Capt. H. E. Dixon, Gen. List, who reverts to Flying Officer, June 30th. Temp. Sec. Lt. (temp. Lt.) J. H. Gaudion, Gen. List, from an Asst. Instr. (graded as an Equipment Officer, 2nd Cl.), School of Aerial Gunnery, July 13th.

Adjt.—Lt. (temp. Capt.) W. O. Raikes, E. Kent R., Spec. Res., from a Flying Officer, and to retain his temp. rank, but without the pay and allowances of that rank, April 17th.

Equipment Officers, 1st Cl.—From the 2nd Cl., and to be temp. Capts. whilst so empld. :—Lt. G. L. Main, Spec. Res.; Sec. Lt. (temp. Lt.) H. W. Mills, Spec. Res.; Sec. Lt. (temp. Lt.) J. J. Botterill, Spec. Res., June 1st. Capt. E. D. Dent, R. Dub. Fus., Spec. Res., from a Flying Officer; Sec. Lt. (temp. Lt.) L. R. Kerridge, Spec. Res., from the 2nd Cl., and to be temp. Capt. whilst so empld., July 2nd. 2nd Cl.—From the 3rd Cl. :—Sec. Lt. (temp. Capt.) A. Sowden, W. York R., T.F. And to be temp. Lts. whilst so empld. :—Temp. Sec. Lt. E. H. Hooper, Gen. List; Sec. Lt. L. Davies, Spec. Res.; Sec. Lt. H. C. S. Bullock, June 1st. Sec. Lt. (temp. Capt.) C. Higham, Manch. R., T.F., June 12th. Sec. Lt. R. A. W. Collet, Spec. Res., and to be temp. Lt. whilst so empld., June 14th. 3rd Cl.—Lt. J. S. D. Harvies-Jones, Spec. Res., reverts from the 2nd Cl., July 4th.

Schools of Instrn.—School of Aerial Gunnery.—Comdt.—(Graded as a Flt. Comdr.).—Lt. (temp. Capt.) A. G. H. Carr, York and Lanc. R., T.F., from a Wing Instr. in Gunnery (graded as a Flt. Comdr.), and to retain his temp. rank while so empld., April 24th.

Chief Instr.—(Graded as a Flt. Comdr.).—Temp. Capt. A. R. C. Cooper, Gen. List, from a Wing Instr. in Gunnery (graded as a Flt. Comdr.), May 8th.

Instr.—(Graded as a Flt. Comdr.).—Sec. Lt. (temp. Capt. R. G. Heyn, Spec. Res., from a Group Instr. in Gunnery (graded as a Flt. Comdr.), and to retain his temp. rank while so empld., vice temp. Capt. F. G. Wilson, Gen. List, June 5th.

Admiralty, July 20th.

The King has been pleased to give orders for the following appointments to the Distinguished Service Order :—

Wing Capt. Edward Maitland Maitland, R.N.A.S.

In recognition of valuable and gallant work in connection with airships and parachutes. He has carried out experiments at his own personal risk, and has made some descents under enemy fire.

Sqdn. Comdr. Charles Henry Butler, D.S.C., R.N.A.S.

In recognition of his gallantry on June 5th, 1917, when he fought single-handed two engagements with a number of powerful hostile machines. He attacked six hostile aeroplanes together over the Thames Estuary, and later attacked two off Ostend. On each occasion the machine selected for attack was compelled to dive.

Flt. Lt. Basil Deacon Hobbs, D.S.C., R.N.A.S.

* * *

The King has been pleased to approve of the award of the Distinguished Service Cross to the following Officers :—

Lt. John Jenkins, R.N.R.

For services in command of a seaplane-carrying vessel, on the East Indies and Egypt Station, during the period April 1st, 1916-March 31st, 1917.

Lt. John Kerr, R.N.R.

For services in command of a seaplane-carrying vessel on the East Indies and Egypt Station during the period April 1st, 1916-March 31st, 1917.

Sub-Lt. (Act. Lt.) Henry Beattie Bell-Irving, R.N.V.R.

In recognition of his services in command of H.M. Drifter I.F.S., in an engagement with five enemy seaplanes on June 11th, 1917. Two of the enemy machines were brought down by gun-fire, and destroyed.

Flt. Comdr. John Callaghan Brooke, R.N.A.S.

In recognition of his services in the East Indies and Egypt Seaplane Squadron during the period April 1st, 1916-March 31st, 1917. During this time he took part in several valuable reconnaissances and bombing flights, obtaining important information and doing considerable damage to enemy organisations.

Flt. Comdr. Thomas Francis Netterville Gerrard, R.N.A.S.

In recognition of his services during an air fight on June 4th, 1917. This officer led his flight against 15-20 hostile aeroplanes, and alone had 10 engagements with these machines. He at-

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The Production of Aeroplanes and their Components

(Seventh Instalment.)

BY STEPNEY BLAKENEY.

A Plane Erecting Jig.

Having considered the manufacture of all the parts required to construct the centre plane, the next thing will be to erect it. A completed Centre Plane Section is shown in Fig. 13. As very considerable accuracy and squareness is required, it will be necessary to do this work also in a jig, as these centre sections must be absolutely interchangeable with each other, and square. Therefore, a small jig-table must be prepared in a manner similar to the fuselage jig-tables.

On this set out a centre line lengthways of the table, and on this line, at right-angles to it, set out the centre line of the compression spars. Then carefully with a gauge mark the centre line on the ends of each spar when it is standing on one of its narrow sides. Lay the spar on the jig-board and see that the centre lines on the spar and jig-board coincide exactly. Then clamp them down, and screw hard wood stops on each side to keep them there, taking care not to put the stops in the way of ribs. Also fix end stops to locate the compression spars in the centre. Then very carefully check the measurements in between after having completed the stops for holding the spars.

The next thing to do is to glue and screw four pieces of packing under them, namely, two near each end to raise them up off the jig about ¼ in. This is necessary to enable the bottom flange of the rib to slide into its position on the spar. To prevent the ribs from being pushed on too far, or being out of parallel with the centre line, limit stops must be fixed, so that the ribs can only be pushed onto the spars a definite distance, with absolute accuracy. Turn-buttons with a fairly long sweep must be fixed to keep the outside ribs up to this position.

Having done this, the next thing to do will be accurately to locate the three light centre ribs, and fix stops each side of them to hold them in position on the spars, for fixing. If all these things are done it will be impossible to build the centre plane incorrectly, provided the stops have been accurately placed in position, and the ribs and spars made correctly.

All that now remains is to get the jig passed by the inspection department, and assembling can then be commenced.

Assembling.

The first thing to do is to mark off the bolt holes on the spars for the wiring plates and strut eyebolts and get them drilled. This being done, slide on the three light centre ribs, then bolt on the wiring plates to the spars, and attached the swaged wires to them, at one end only; then slide on the compression end ribs.

Then place the whole over the jig and adjust each component part and drop the lot into their respective positions in the jig. Screw each in position, and give a touch of glue to each one, then leave the whole to set.

When the glue is set the centre plane can be taken out, the leading and trailing edges fitted, the bracing wires coupled up, the tension adjusted, and the whole plane finished and sand-papered off, ready for covering with fabric, with the exception of fixing the four eyebolts for attaching the plane to the vertical centre plane struts.

Bottom Main Planes.

The construction of the bottom main planes must now be considered, and the first thing that has to be done is to produce the front and rear spars, which we will assume to be 19 ft. 9 in. and 19 ft. 3 in. long, respectively, by 3½ in. by 2 in., tapered at the outer ends and lightened in the web where possible to H or girder section.

PLAN OF CENTRE SECTION.

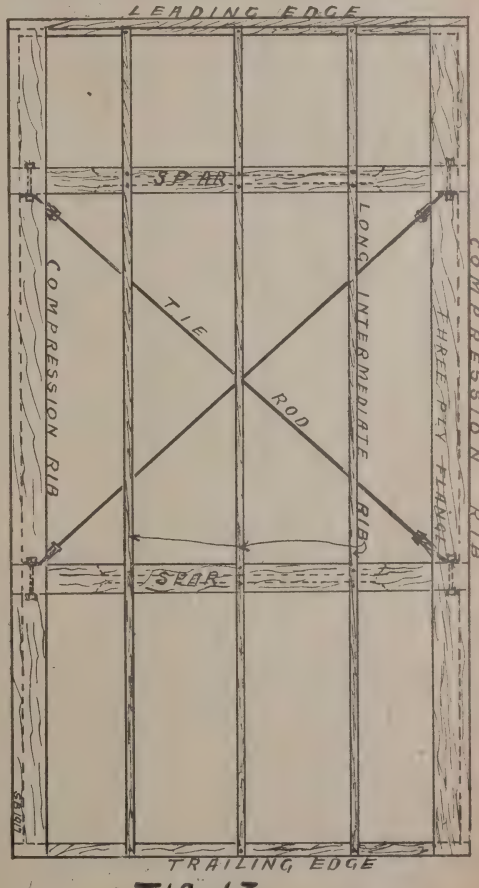

FIG. 13.

First-class spruce must be selected, and the timber cut so that a vertical grain is obtained when the spars are finished and lying in their natural position. They must have no short or twisted grain and must be free from any faults such as

"feathers" in the grain, sap, dead wood, shakes, splits, knots, or pockets of resin, however small.

As the A.I.D. may be relied upon to give these a severe testing and a rigid inspection, it is not advisable to cut up faulty timber and work it up in the hope of getting it passed.

Having selected the timber, it will be marked off, and taken to the circular-saw and sawn into the required rectangular section and length plus about 9 in. for cutting and finishing off ends.

LIGHTENING IN SPARS.

FIG. 14.

These sides will be planed and the edges shot; they will then be sent to the setter-out, who will set out the lightenings on a template of the length and width of the spar, but ½ in. or ⅝ in. thick, preferably of hard wood. The outer end will be tapered to suit the diminishing depth required in finishing off the tip of the wing where it cuts the leading edge.

Machining Out.

The lightenings having been marked off on the actual spar, a template or section of the finished spar, where the lightenings occur, should be made and sent in to the mill to the spindle hand, who will prepare the cutters, and spindle out a short length of spar to test the dimensions of the cut. This being correct, the spars may be lightened out as far as the straight portions go.

After which the spar template must be placed on the spar and the curved portion carefully marked off. Then the spar must be sent to the band-saw to have this portion cut to the curve, and it can then be finished off on the spindle or bench, as may be more convenient, or sent to the wood-finishers' benches.

It will then be ready for the spindling out of the lightening to be completed, as in Fig. 14.

Bevelling Off.

The last operations to be done to complete the spars for use will be to bevel the edges slightly right across to fit the contour of the ribs. As this bevel will be a definite angle and will probably be specified in degrees and half degrees, a level protector will be required to set out and check this operation. Careful reference to the plan should be made to ascertain the amount of bevel required. This work may either be done on the planing machine or the spindle.

A Delicate Operation.

The bolt holes for the wiring plates must now be marked off, also the holes for the strut eyebolts, which go vertically through the spars.

Before drilling these bolt holes it is necessary to point out to all concerned that the importance of these holes being drilled perfectly cannot be over-estimated, and, unfortunately, there are many who, being new to aircraft work, get an idea that the works' manager, foreman or inspectors, who point this out, do so either for the sake of talking or of showing their authority. This is not so. The holes must be drilled out in one dead straight line, and not started from each end, and allowed to meet "somewhere" in the middle, and as is done occasionally, an old bolt being driven through to clear the hole. This sort of work is not wanted, neither are "rat holes."

The holes must be accurately bored or drilled with a sharp cutting tool, exactly where they are required, and no limits are allowed for deviation, therefore it is advisable for all bolt holes to be bored by an accurately running sensitive drilling machine, bolted down to a firm foundation. Accurate work is rarely obtained from machinery attached to wooden floors in galleries, as is found in some works.

Finishing the Spar.

Having completed the holes, the last work to be done is to taper the end of the spar down to the point where it meets the leading edge, and this will be done by the wood-finishers' department, before going to the erecting shop. This being done, it can now be inspected and passed by the A.I.D.

Wing Section on Trestles.

The construction of the wings may now be considered, as the manufacture of ribs has been previously dealt with, and also the leading and trailing edges. For this work some light trestles, three in number, will have to be made, about 3 ft. high and 3 ft. 6 in. wide, of 1 in. boards, on edge, screwed to the floor with light iron knees and braced together with a light longitudinal bracing about 3½ in. by 1 in. Inclined bracing will connect the longitudinal bracing to the vertical leg of the middle trestle. The trestles being completed the erection of the wings can be commenced.

Take the spars and lay them in their correct positions on the trestles and mark off the positions of the various ribs, of which there will be about four different types. Commencing from the root of the wing and working outwards to the tips, we shall have the following: first, an extra strong rib with a solid web, then a number of ribs of a light design, with three-ply or lightened spruce webs, and then another rib with a solid web, where the joint occurs between the rib and the aileron.

After this, we have a number of ribs with the trailing end cut off where the rib flange reaches the rear side of the rear spar. The aileron makes up this portion, and is attached to the rear wing spar by about four hinges, which are attached to the wing spar and the aileron spar by bolts.

As each type of rib has a drawing number and part number, it will save a lot of confusion if the position of each rib on the spar has the drawing number and part number stamped on it with a rubber stamp, as this will enable any unskilled labour which may be employed in the erecting shop to place the right type of rib in the right place, and prevent mistakes and disputes.

Having marked off the positions of the ribs, the next thing to do is, make a list of the ribs required, and the number of each type required, and obtain these from the finished wood parts stores, and examine each one to see that it has been inspected and stamped by the A.I.D. It will be as well to keep the list of ribs for future use.

We can now thread the ribs carefully on the spars. In some cases we shall, no doubt, find that the spar holes in the webs of the ribs require easing. This can be done with some sandpaper wrapped round a stick.

The first ribs to be put in, will be the ribs in the centre of the wing. Then work outwards towards each end. Having threaded all the ribs on the spars the front spar should be clamped down to the trestles, and the mark of the rear spar end carefully squared off with the end of the front spar. These ends refer to the root of the wing, next to the fuselage.

This being done the ribs can be fixed to the spars by means of small brass screws. Each of the ribs should be tested with a square to make sure they are square with the spars.

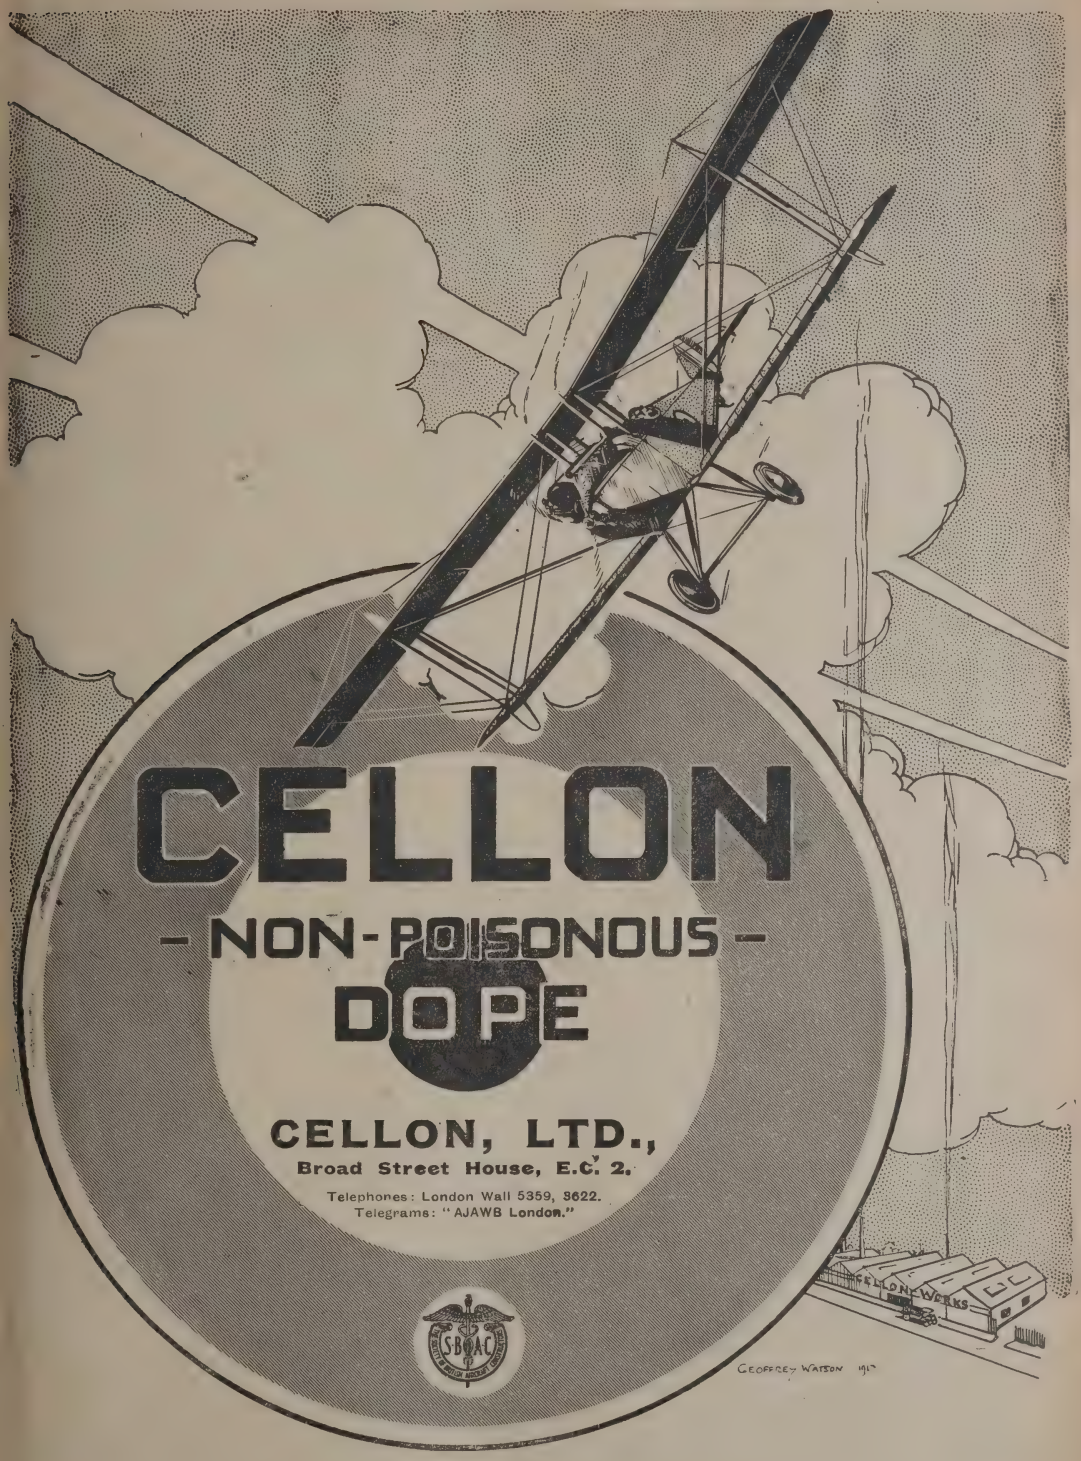
Wiring Up.

The ribs being fixed, the wiring plates can be bolted in position and two or three bays of wire bracing put in, to keep the wing in shape.

It will be as well now to thread the stringers in position. These consist of long lengths of spruce about 5/16 in. square, which run parallel to the spars, and pass through the webs of each rib just under the rib flanges.

We can now turn our attention to the leading edge, which consists of spruce lightened out the shape shown in Fig. 12. This will be now threaded through the noses of the ribs, care being taken, after it is in position, to remember to see that all ribs remain square with the spars. As soon as this is done, the ribs can be screwed to the leading edge, and each side of the rib, then touched with glue.

Scarfing the Wing Tip.



The next thing to do will be to prepare the scarfed joint for the junction of the leading edge with the ash bend at the tip, this will be done by tapering the end off for about 7 in., after which the bend can be treated in the same way, carefully fitted and tried in position. Then the permanent joint with glue and ¾ in. by 6 in. gauge brass screws can be made. Two screws to each side should be sufficient, the whole being clamped up and left for about 10 hours. After that the scarfed joint can be shaped up and cleaned off, and left ready for binding with balloon cord.

The Trailing Edge.

The next thing to do is to fit the spruce trailing edge, and this will be done in the same way, but without any binding cord or similar joint. The strut to the end compression rib can now be fitted, also the small packing pieces between the ribs and riblets (small ribs), which are glued and tacked down.

Finishing Off.

When the whole lot is done, the next thing to do is to go over the whole skeleton wing and chisel off all sharp points and square corners and file off all projecting or rough screw-heads, tacks, and wood ends of riblets, etc., etc., and well sand-paper all over. After this, the wing may be considered ready for final trueing up and passing by the works' inspector, who, if he finds any faulty work, should see it rectified. Thereafter the wing is ready for passing by the A.I.D., for tapering and varnishing.

CELLON WERKS
GEOFFREY WATSON 1917

Then it will again be inspected by the A.I.D., and covering may be commenced.

COVERING.

The cover having previously been stitched up, and all seams carefully examined, and the cover being quite dry, it will be drawn onto the plane, starting from the leading edge and pulling across to the trailing edge, half the cover being on the lower side of the plane, and the other half on the top side. The fabric will then be carefully and evenly pulled taut, and tacked down temporarily, all seams being carefully straightened by pulling the fabric at each end. After this, all surplus fabric will be cut off and the two ends of the fabric sewn up, taking care to turn in the edges of the fabric, the joint being along the centre of the trailing edge, and, where the aileron gap occurs, along the top edge of the rear spar.

STRINGING.

Having neatly sewn up all the edges, the next operation is stringing the wing to keep the fabric tight to the ribs. This is done with a light, fine string, which is passed through the fabric from the top to the bottom round each rib about every four inches and knotted at each turn, taking care to knot up fairly tight.

This work, as well as the sewing, will be done by girls, and they do it well, after having a little tuition, but they always need a little supervision. One thing to be avoided is making holes with the stringing needle, where it is not intended a string should pass through, the only hole permissible being the one where the string passes through.

When this is done, the plane should be weighed to see that it does not exceed the standard weight for its type, and is then ready for its first coat of dope.

DOPING.

The plane having been brought into the dope room, one thing to do is to see that the specified temperature demanded of the room exists. The plane is then laid on bearers running longitudinally under the spars, and these will be supported on trestles. The dope then can be put into galvanised paint pots, for convenience. Special brushes will be required for doping, preferably about 4 in. wide. Common brushes for this work are useless, as the hairs come out and cover the plane, and spoil the finished appearance.

To start doping take a fair amount of dope on the brush, and work it first from leading edge to trailing edge, and then from left to right. Spread it evenly, taking care not to start too big a patch at once. In this manner cover the whole plane, after which the specified time must be allowed to elapse before proceeding.

STRIPPING.

The next thing to do is "stripping" the plane. This consists of again doping the line of stringing, and at once laying a strip of frayed tape over the stringing on to the wet dope and finishing off smooth with the brush. It is well also to cover the edges in a similar manner.

Allow the whole thing proper time to dry, according to the doping scheme employed. When dry, the whole should be doped again, until it has had about four or five coats. When this is done, the identification mark is set out, and the outer circle filled in with blue dope or colour, and then the red bull's eye. After this is done on the undersides of the lower planes, and has dried thoroughly, the wing can be varnished with the special varnish.

When this has set, the coat of pigment can be put on the top, and, finally, the last coat. The plane can then be left to dry, the whole of the doping process being complete.

In this manner ailerons, tail planes, and elevators will be doped. Other schemes are available, and may be worth trying.

AILERON CONSTRUCTION.

The construction of the ailerons can next be taken in hand, for the work of construction is very similar to wings. The difference is that the spar of an aileron is generally hollow, and made in two pieces, very carefully and well glued together.

The making of the hollow box spar requires very careful consideration, unless undertaken by experienced hands who are used to this class of work.

The timber selected requires to be of the best quality, and straight grained and dry, otherwise failure may reasonably be expected, and a considerable amount of time and material wasted.

The aileron spar we may assume to be about 4 ft. 9 in. long and 2⅛ in. deep and about 1¼ in. broad. They are made in halves, with about six lightenings in each half opposite each other. These will be cut out on the spindle.

These two parts form the spar, the lightenings being in the middle. The whole, when together, will taper down in the last third of its whole length to about one half of its normal sectional area, the ends of the spar, of course, being left solid.

In preparing these two halves to form the spar a considerable margin of timber should be allowed for cleaning up on the outside after spindling out the lightenings. Also, it is most essential that the halves of the spar, after coming from the spindle, should be placed in clamps to dry, as this timber, being freshly cut out, is likely to twist or warp and lose its shape if left to dry in a free state, together with the exposure to the air.

The halves of the spar having had a couple of days to dry, should now be brought to the wood-finishers' benches, where the joint faces will have to be carefully tried for truth of surface, and all inequalities removed with a trying plane, so as to remove as little as possible.

Having made the joints true, the next question is glueing the two halves together. For this purpose, glue of special strength will have previously been obtained.

Before spreading the glue, the surfaces of the two halves of the span are frequently ironed with a hot iron, so as not to let the glue grow cold and partially set before the two halves can be placed together.

Great care indeed must be taken quickly and very evenly to spread the glue, which should be done with a brush of moderate size and good quality. After this, the two surfaces should be slightly rubbed together and quickly and evenly clamped up and left to dry in a temperature of about 65 deg. for a couple of days.

The spars having thoroughly dried, can now be taken out of the clamps and sent to the wood-finishers, who will dress off the outside of the spar to the finished dimensions, taking considerable care to leave the spar all over a bare 1/32 in. full.

The spar can now have the holes for the hinge bolts and fittings marked off and the holes drilled on the drilling machine.

(To be continued.)

COMPONENT PARTS.

Aircraft constructors will do well to note that the British Gold Shell Ring Co., Ltd., of Hounslow, Middlesex, are in a position to give early deliveries of all kinds of small metal parts for aircraft work.

The special plant at their disposal is peculiarly suited for turning out such parts as shackles, cable-guides, etc., and stocks of various parts are available for immediate delivery. The firm is open to quote for the manufacture of any component in quantities upon receipt of specimen and specification.

A TRADE NOTE.

The Nieuport and General Aircraft Co., Ltd., of Langton Road, Cricklewood, London, N.W.2., wish it to be noted that in order to prevent misunderstanding and confusion, the above is their registered and only address, to which all communications should be sent. They have no agent whatever in London or elsewhere, and Major S. Heckstall-Smith is the general manager of the business of the company. The firm's telegraphic is "Nieuscout," Crickle, London, and the telephone is 2455 Willesden.

AN AUSTRIAN AIRCRAFT CONCERN.

"The Phönix Aircraft Works" have been formed in Vienna with a capital of 1,000,000 crowns, to be raised soon either to three or five million. The moving spirit of the concern is Director Gabriel of the Austrian Albatros Company, formed on the outbreak of war, and it has been agreed that the latter firm shall continue with experimental aeroplanes only, and sell the exclusive rights of the produced aircraft to the Phönix Company.

LANG PROPELLERS U.S.A.

An advertisement in the "Aerial Age Weekly" of July 2nd, announces the formation of the Lang Propeller Company, of America. Mr. A. Dashwood Lang, of Weybridge, recently went to America, and there is no doubt that his presence in the United States will contribute materially to the success of the new American Air Fleet. Correct propeller design is an essential factor in the construction of an efficient aeroplane, and Mr. Lang is accustomed to produce airscrews for every conceivable type of aircraft, from the biggest airship to the smallest scout.

The older members of the British Aircraft Industry will remember Mr. Lang's early experiments at Brooklands, and his subsequent work with the British and Colonial Aeroplane Co., Ltd. Since that time he has steadily applied himself to the design and construction of airscrews for big and small aeroplanes, seaplanes and airships. The quality of his work has never been surpassed, and he was particularly successful in metal-tipping seaplane propellers.

For the time being correspondence should be addressed to Mr. Lang, c/o "The Aerial Age," Box 178; 280, Madison Avenue, New York, U.S.A.

A MIDLAND DEPOT.

The London firm of S. Smith and Sons (Motor Accessories), Limited, wish it to be noted that they have opened a service depot, for the convenience of Midland traders, at 122, Alma Street, Birmingham. This depot carries a full range of the firm's well-known accessories, and the new departure will doubtless save considerable time in the fulfilment of orders.

SUNBEAM-COATALEN AIRCRAFT MOTORS

CONTRACTORS TO H.M. ADMIRALTY, RUSSIAN & FRENCH GOVERNMENTS

The SUNBEAM MOTOR CAR CO. Ltd.
Head Office and Works - - - WOLVERHAMPTON

At the Milan Aero Show.

By T. S. HARVEY.

All but two of the twenty Hun engines at the Milan Show are shown unmounted. One of the two, a Daimler, is on the Aviatik (No. 76 in "La Guerra"), a machine which was repainted and flown by Baracca till a stop had to be put to the confusion resulting therefrom. The other is on a much done-in machine and not identifiable.

Motor beds seem mostly of wood reinforced at the angles by steel corner pieces. The excessive number of cylinders, bolts, and everything dismountable, on both and every side or end, speaks of method run mad or intense stupidity. The use of different coloured wires, H.T. wires from magnetos, is much to be desired, too.

The workmanship of the small "running-repair mechanic" appears bad. I noted, too, very few of the original magnetos on the engine, possibly because of the sea water in which so many of the machines took their last dip. Radiators, when present, are small, so presumably cooling is ultra-efficient. Every tube and pipe is swathed in felt, asbestos, etc.

THE HIERO MOTOR.

Very battered and worn were the Warchalowskis, and the Hiero, their cousin, while the dozen Austro-Daimler and Mercs. ranged from engines of 1913 to a new Merc., modified internally, No. 25076.

The following description of the Warchalowski applies to the Hiero apparently, a more modern and ear-soothing name chosen by Warchalowski and Tissler and Co., of Vienna, for much the same motor. [The name came, one believes, from the fact that the engine was designed by Hieronymus, the famous driver of racing cars.—Ed.]

These engines seem to have been mostly fitted to seaplanes. The 215 h.p. is obtained from six cylinders set separately, three by three on the crankcase, to which they are attached by big wing-bolts.

Between the third and fourth cylinders passes a vertical shaft which drives the overhead valve cam-shaft the two mags., and the pumps. Independent dual ignition with two plugs per cylinder, half compression actuated by forked lever displacing a cam-shaft, and an inspection window in the crank-case, are good points. The motor, owing to the space occupied by this vertical shaft, is very long.

The Hiero has a hefty trumpet-shaped expansion chamber into which the burnt gases are led by the normal exhaust pipes. There is only one other "silencer" in this part of the show, and, perhaps, in the whole exhibition.

The "Rapp," of which there are two examples, is a six-cylinder two by two water-cooled 165 h.p. vertical, with overhead cam-shaft of early date. Two magnetos, a carburettor "Zenith Vergaser," and a crude but no doubt effective silencer are fitted, and the use of semi-elliptical six-leaf springs for the valves is a feature.

The outstanding feature among the power plant at the Show is the omnipresence of the 6-cyl. vertical engine. There is not a single example of any other type among the 20 odd captured Hun motors, and among the new Italian-built engines exhibited the exceptions could be counted on one handful of fingers.

THE AEROPLANE EXHIBIT.

The "Italian Military Aviation" exhibit, in a large tent-hangar, is composed of about twenty different motors used by the Aero Corps since the very beginning till to-day, and is about as instructive an exhibit as man could hope for. It ranges from an immensely ancient Wright 30-h.p., with a 4-cylinder vertical water-cooled car type, to a large Salmson and a Spad with an open V, Hispano-Suiza, through horizontal Darracqs, and every kind of exciting and mischief-bringing contraptions, such as one knew in the good old days when a city could be wrought to enthusiasm by a long hop.

I noted a 4-cylinder Colombo, a water-cooled car type, which did good service in early days, and has now developed into a 6-cylinder, much used at the front on Savoia-Farmans, and of which the Bianchi firm are, I believe, the builders by licence.

Nor is the V motor much in evidence, with the exception of a very big 12-cylinder Nagliati, on Renault lines, to all appearances, and of the performances of which, if any, I can say nothing.

The Isotta-Fraschini and Fiats stand out, of course, being engines now fitted to the greater part of the aeroplanes built by the Caproni, Pomilio and Fiat concerns among many others.

Their general lines are familiar to everyone, as both rely on perfection of normal practice by attention to detail rather than on any distinctly original feature. The Isotfa-Fraschinis, whose designs are, I believe, Government property, are also built by several of the better known car firms, and by the big firm of Tosi at Legnano. A beautifully sectioned engine of this build was shown, each cylinder of which was shamelessly laid bare from a different point of view.

A big 8-cylinder, on the same lines, was to be seen mounted on the central body of a 600-h.p. Caproni triplane.

The later 250 Fiats were not exposed, being, I gather, more needed elsewhere. According to D'Annunzio, it is a "God-motor." Anyway, the Show expressly proclaims itself not "up-to-date."

In dealing with the more recent part of the Show, and some accessories of the myriads exhibited, I feel bound, in gratitude to the designer, to begin by naming the ever-popular Nieuport, a "Baby," which MM. Macchi, of Varese, were showing, presumably, merely not to be absent. A view of some of their other products would give to think. Luckily for the Allies the firm's output more than suffices for the needs of these evil days.

Next to them an unwinged Pomilio was well attended to by a show-woman, and drew a throng.

The Società Anonima Meccanica Lombarda, of Monza, and elsewhere, had a neat school biplane with their own 150-h.p. vertical 6-cylinder (a motor on standard lines). The machine has dual-control and plenty of surface; a type which is much used officially. The many merits of the S.A.M.L.'s other craft are best left alone at present.

Models of a "cruiser" by Frattini—held, *on dit*, in much esteem, and, hence, to be passed over—and of a biplane, designed by Engineer Darbesio, of the "Asteria," and a real pioneer, attracted the eyes of the "*conoscitori.*"

A wonderful collection of Service photos, doubtless of supreme value in their time, were there for the conversion of the hard-hided, and the instruction of the half-baked. Exhibited by the squadron which obtained them, each collection is a document of the prowess of the men belonging to it.

The photographs of the dirigible section showed how correct were the designers of the early vessels of the "M." series, a series which seems almost unmodified during the last two intense years, if one excepts slight improvements to the gun-turret on the forward deck (or back?) and some re-arrangement of the control surfaces, probably to meet the increased motor kick and general improved efficiency in lift.

The firm which has to do with the "Forlanini" show much of technical interest, such as valves, keel-construction, etc., as well as photos of the various vessels of the series, about which silence were golden.

Engineer Canovetti's incessant mental activity is responsible for an ejector, which, however, for want of time and a teacher, I must sidetrack till I can get a first-hand explanation of it.

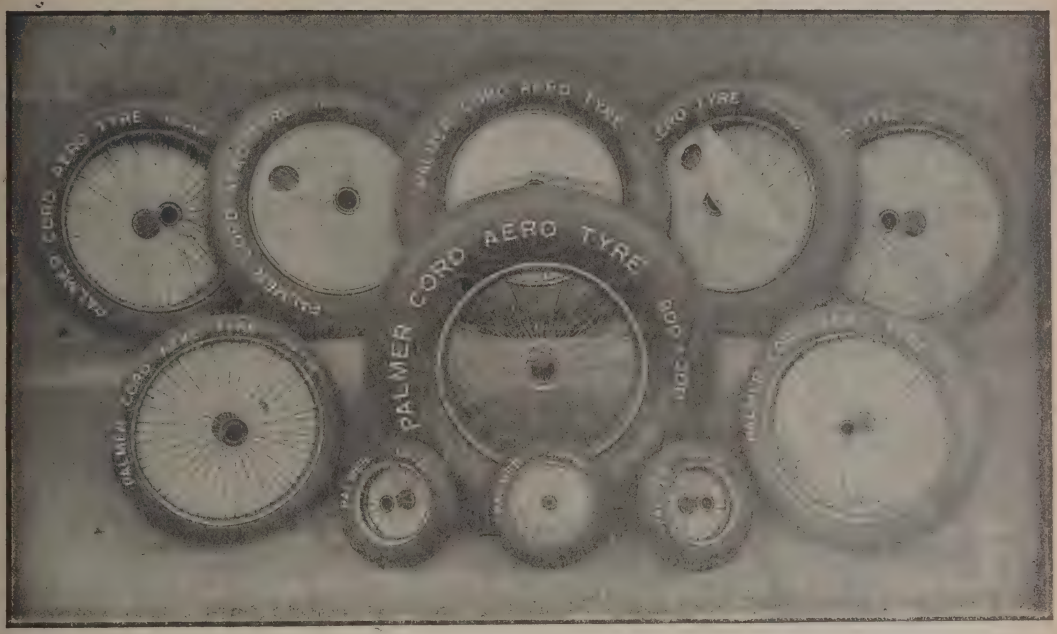
Only one freak aeroplane was there to puzzle us. Not to be mixed up with helicopter or orthopter, the "Somalvico" circular aerofoil, from which a fuselage with its power plant is suspended by a universal joint, revolves in the reverse direction to the normally placed propeller. In its normal position the section of the circular plane (or planes) is roughly that of a shallow hand-basin *in use*, and so resembles an inverted umbrella. Stability and parachute properties are claimed, and the model has given unexpected results. [A delightfully non-committal, if ambiguous, phrase.—Ed.]

All over the show, mounted and not so, one sees the Marelli magnetos. A four-spark per rev., with separate commutator for even numbered multi-cylindered engines, is an extraordinary and compact little instrument.

The new Redini carburettor is merely a butterfly throttle, in a tube, with, loosely attached, a much tapered needle lying in the petrol pipe which enters the induction tube just below the throttle.

As the butterfly valve is opened or shut, it pulls the needle up or down the petrol pipe, which is thus gradually freed or obstructed, so that more or less petrol passes. Thus a variable jet effect is obtained simply and most cheaply. The Redini device is shown fitted to inlet pipes of various motors.

Garlaschelli, of Milan, has a stand of big petrol and oil tanks. Those for the big Caproni, gorgeous in coppered aluminium (?), attract the eye and the fingers that tap.



Electrically-heated clothing is the effort which the F.A.R.E. Co., of via Pietro Maroncello, Milan, is making to equip one for the altitudes to which "archies" are driving pilots, with the assistance, be it said, of the bigger motors everywhere foreshadowed. Gloves, with press-button fasteners as contact-makers, inner soles, head-covering, oil-pipe-heaters, and manifold other applications of their idea, are exposed to make the perspiring visitor envious.

Cabinet making, that old Italian industry, has found its feet again, and is well represented by Zari Bros., who, for instance, stage boat bodies, floats and fuselages for well-known types, all admirable.

Excellent, too, is the woodwork of Attilio Mazzi.

Metallurgy and its professions are too numerous to be even sorted out. That the Italian industries, unshackled from foreign subsidised competition, should have been able to rise so satisfactorily to the occasion is no surprise. The pity is that it could not have been done earlier. No other nation has suffered so from undue modesty, charming, but not business.—T. S. HARVEY.

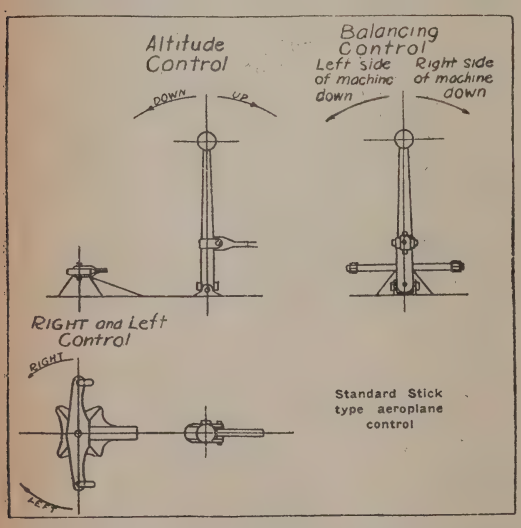
Standardisation in the United States.

"Aerial Age" (New York) of May 21st, states that at a meeting of the Automotive Association Mr. F. S. Duesenberg read the report of the Aeronautic Division.

In the discussion it was brought out that the Stick control is largely favoured for light machines and the Deperdussin control, commonly known as the Dep., is favoured for heavier machines.



Probably one of the most important steps in view of the formative condition of the aeronautic industry was the decision to adopt the English or inch system of measurement because of the requirements of the United States Army and Navy service.

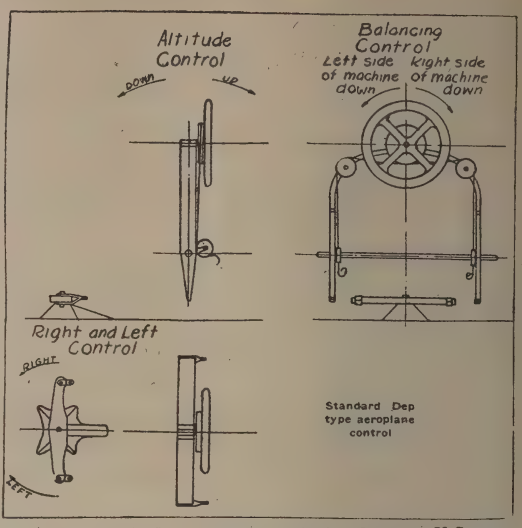
A letter was read from R. S. Griffin, engineer in chief of the United States Navy Bureau in Washington, in which he stated that the following suggested standards taken from the report are acceptable to the Navy Department:

(1). English system of measurement.
(2). Marking oil and fuel lines.
(3). Elimination of gauge numbers.
(4). Engine supports.
(5). Spark plugs.

He also suggested that a rubber tube be used to connect the gasoline tank to the carburettor, and the Bureau has asked for specimens of the wire and turnbuckle fittings described in the report. In other words, the Bureau is still questioning the wire tensile strengths, thimbles, turnbuckles and tachometer shaft drive.

CONTROLS.—It is found that these two types of control, namely, the Deperdussin (Dep.) and Stick controls are necessary to cover most types of plane in military use. The standards specify that particular movements produce particular effects, but do not specify the connections, since these vary a great deal in practice.

ELIMINATION OF GAUGE NUMBERS.—Sheet metal is to be specified by thickness in decimal fractions of an inch. Rods, wires and cables are to be specified by diameter in decimal fractions of an inch. Tubes are to be specified by outside diameter in inches or fractions and thickness of wall in decimal fractions of an inch.



ENGINE SUPPORTS.—The division recommends the following table of dimensions, omitting all reference to sizes of bolts:

Distance between timbers	12	14	16
Width of bed timbers	2	2½	2½
Distance between centres of bolts	14	16¼	18½

BASIC SYSTEM OF MEASUREMENTS.—In view of the fact that the Army and Navy Departments are not both in favour of adopting the metric system, and further, in view of the necessity of arriving at standards that will mean the least possible delay in the production of aeroplane parts, this division recommends definitely to use the English system of measurement except in isolated cases such as spark-plug threads where the metric system is desirable in order to effect interchangeability with some well established standard.

SPARK PLUG DIMENSIONS.—The following dimensions for spark plugs were agreed upon:

Thread: 18 mm., 1½ mm. pitch.

Form of thread: International standard. (Same as U.S. standard only with one-half as much truncation at root of thread.)

Gasket shoulder to end of shell: $\frac{5}{8}$ in.

Hexagon: 1 in. across flats.

The question of thread tolerances was deferred.

PROPELLER HUBS.—The design of propeller hubs of various sizes should be based upon pounds-feet torque and not on horsepower.

DIRECTION OF ENGINE ROTATION.—The direction of engine rotation is normal when the final power delivery member of the engine rotates anti-clockwise, viewed facing the power delivery end. Opposite rotation is anti-normal.

DETAILS FOR PLANES.

HARD WIRE LOOP.—This consists of an oval coil of wire through which the hard wire is slipped, bent in the form of a loop, again inserted, and the end bent over against the coil. The whole is then soldered. This is identical with the present British standard.

FLEXIBLE CABLE ENDS.—The sketch shows the cable end wrapped around a "standard thimble." The length of splice from pointed end of opening in thimble was represented by "splice plus or minus $\frac{1}{8}$ in." The end of the splice is wrapped with a serving of shellacked harness thread. Dimension A represents the distance from end of opening in thimble to end of serving.

Diameter of Cable.		Length of Splice.	Number of Tucks.	Length of Serving.	A	Full Strength of Cable.
$\frac{3}{32}$	7 × 14	1¼		1	½	800
⅛	7 × 19	1½	3 over	1	½	2000
$\frac{5}{32}$	7 × 19	1¾	core buried	1¼	½	2800
$\frac{3}{16}$	7 × 19	1⅞	4 under	1½	¾	4200
$\frac{7}{32}$	7 × 19	2⅛		1¼	¾	5600

GALVANIZED NON-FLEXIBLE ENDS.—The cable end is wrapped about a thimble, with a total length of splice indicated by L; 0.041 in. soft steel wire is to be used for wrapping, and the sketch indicates two spaces left between convolutions of the wrapping wire, width of the spaces being indicated in the table. The accompanying table gives the sizes and strengths:

Diameter of Cable.		L	Space.	Wind.	Full Strength of Cable.
$\frac{1}{16}$	1 × 19	1½	⅛	1	500
$\frac{3}{32}$	1 × 19	2	⅛	1½	1100
⅛	1 × 19	2½	⅛	1½	2100
$\frac{5}{32}$	1 × 19	2¾	⅛	2	3200
$\frac{3}{16}$	1 × 19	3	$\frac{3}{16}$	2¼	4600
$\frac{7}{32}$	1 × 19	3½	$\frac{3}{16}$	2¼	6100
¼	1 × 19	4	¼	2½	8000

THIMBLES.—It was voted to approve, subject to approval by the departments of War or Navy, thimbles for wire ends as shown by Plate No. 7 following page 118, First Annual Report

of the National Advisory Committee for Aeronautics (1915). These thimbles will be shown by appropriate drawings. The sizes are indicated roughly by the following table:

Size of Rope.	Thickness of Thimble.	Width of Eye.	Length of Eye.
1/16-3/32	0.075	0.35	0.70
1/8	0.12	0.35	0.70
3/32	0.17	0.40	0.80
5/32	0.21	0.50	1.00
7/32	0.24	0.60	1.20
1/4	0.27	0.70	1.40
5/32	0.30	0.80	1.60
11/32	0.33	0.90	1.80
3/8	0.39	1.00	2.00

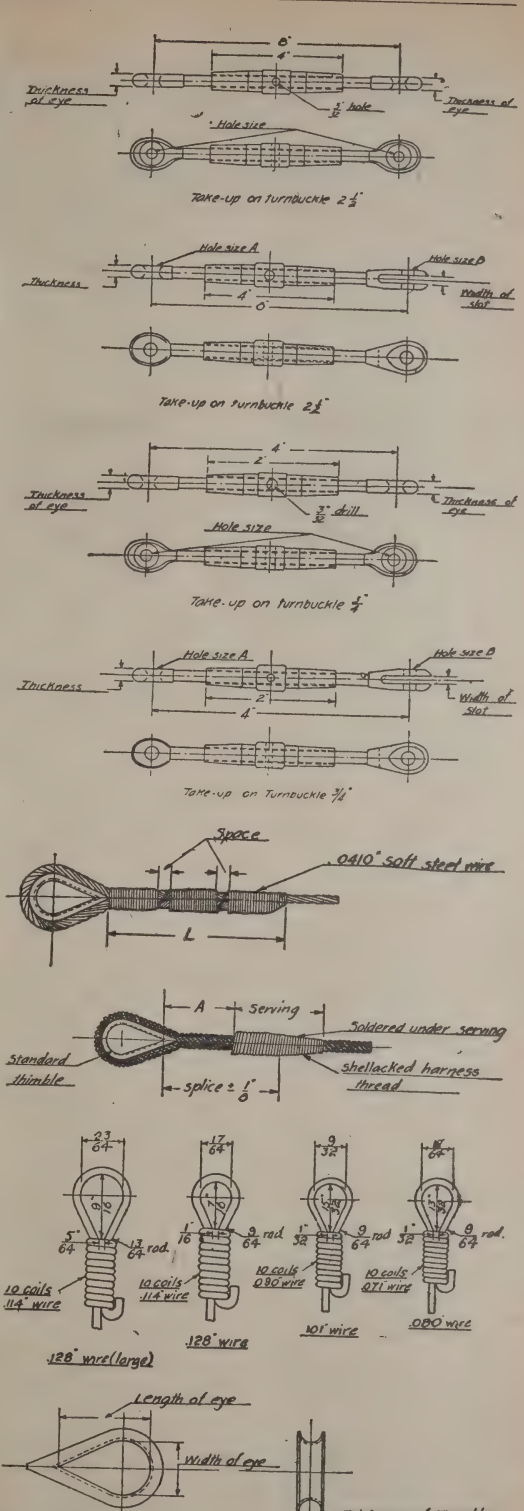
TURNBUCKLES.—Detail dimensions of both short and long types are being studied by a sub-division consisting of Chairman Manly and Capt. Clark. The following main dimensions are recommended for immediate adoption:

(With either two eye ends or one eye and one yoke end.)

	Short.	Long.
Length of Barrel	2	4
Length between Eyes:		
With threads flush with ends of barrel	4	8
With maximum extended	4 5/16	8 5/16
With minimum extended	3 1/4	5 1/2

Strength (lbs):

S.A.E. Numbers.	Short.	Long.
1	500	500
2	1000	1000
3	1500	1500
4	2000	2000
5	2500	2500
6	3000	3000
7	3500	3500
8	—	4000
9	—	4500
10	—	5000
11	—	6000
12	—	7000
13	—	8000
14	—	9000
15	—	10000



MARKING PIPE LINES.—Gasoline lines should be marked with ed stripes ½ in. wide painted around the pipes 24 in. apart, care eing observed that there is a stripe near each end of the pipe. The oil lines to be marked similarly but with white stripes.

AERONAUTIC WORK STILL IN PROGRESS.

A sub-division consisting of Messrs. Vincent, Crane and King as been appointed to take up the subject of pipe fittings. Data e also being collected regarding high grade alloy steel tubing. ome revision of the propeller shaft end dimensions is under onsideration. Professor Z. Jefferies, Aluminium Castings Comany, and K. W. Zimmerschied, chairman of the iron and steel vision, have been requested to submit suggestions in regard to uminium alloy specifications.

Three recommendations contained in the report were referred ack to the division. The first of these suggested certain standrd sizes for tyres and rims; the second was a suggested standrd design for a tachometer driveshaft, and the third was an ceptance for aeronautic work of the existing iron and steel andard specifications.

J. E. Hale, Goodyear Tyre and Rubber Company, inquired garding the tyre sizes which he said are all new. On the other nd, the 26 by 4 has been popular with production running into e thousands and yet these are not mentioned in the report. uesenberg stated that in the committee meeting no one had ade any objections to the tyre sizes, although no tyre men ere present. Hale stated that none of these tyres are made, t this is a matter which should be considered, and although e situation is by no means grave owing to the relatively small oduction, it would be a question of making matters much ore simpler if existing sizes could be used. Duesenberg pointed t that the 32 by 4½ tyre is easily secured and is the normal e for the popular 33 by 5 oversize tyre used extensively in cing.

AEROPLANE FITTINGS—Suggested standard forms of long and short turnbuckles, flexible cable ends and stay wire loops

THE PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by The Aeroplane from the current Official Patents Records.

Patent Applications.

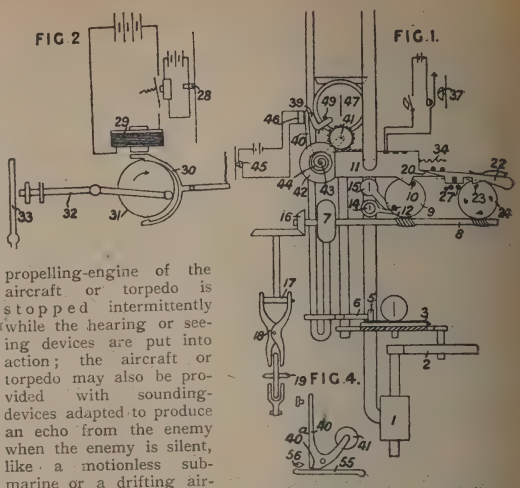
Abridgments of recently published Specifications.

106,226. Torpedoes. Steinmetz, J. A., 10, North Fourth Street, Philadelphia, Pennsylvania, U.S.A.

Consists in connecting a flying machine by a cable to a torpedo supported by a float provided with a propelling-gear worked by a drum by the pull of the connecting-cable. In the form shown in Fig. 5, the torpedo comprises an explosives casing D and a float C propelled by a propeller F driven through a shaft G, Fig. 2, and gearing H by means of a drum J by the pull of the cable I connected to the flying machine B. When the machine is flying low or on the surface of the water, a lever L locks the drum J as shown in dotted lines and the torpedo is towed by the flying machine; but when the flying machine rises, the lever L is pulled up, releasing the drum, and the pull of the cable drives the drum. The explosives casing D is connected to the float C by chains E so that it may swing under the usual protecting-net N to strike the hull of the attacked ship A.



[This is genuinely humorous.—Ed.]

106,299. Aircraft and Torpedoes. King, W. J. H., 25, York House, Kensington, London.

Relates to aircraft and torpedoes provided with controlling-devices sensitive to sound or light emanating from an enemy craft so arranged as to cause the aircraft or torpedo automatically to hunt the enemy. According to the invention, the propelling-engine of the aircraft or torpedo is stopped intermittently while the hearing or seeing devices are put into action; the aircraft or torpedo may also be provided with sounding-devices adapted to produce an echo from the enemy when the enemy is silent, like a motionless submarine or a drifting airship. Several sound-receivers may be used, or a single one which is rotated and carries contacts for closing various controlling-circuits. Damping-devices may be added to vary the sensitiveness of the sound-receivers. The usual gyroscope is put out of action while the sound or light receivers are in action. Means are provided to adjust the time when the sound or light control shall begin, and to stop the motor until the receivers are affected by the presence of the enemy. The depth or height of the torpedo or aircraft may be controlled by a pressure gauge, and a pressure gauge may also be used to cut off the firing-circuits of explosive charges on the torpedo or aircraft to make these safe against surface ships or high buildings. In the form shown for torpedoes in Fig 1, the supply valve 6 of an auxiliary motor 7 is opened at the appointed time by a pin 5 on an adjustable friction disc 3 driven by clock-work or by gearing 2 from the main engine 1. The shaft 8 of the motor 7 drives two discs 9, 24 through worm gearing. Pins 10, 12 on the first disc 9 slide a valve 11 in the supply pipe of the main engine to control the intermittent stoppages and rock a valve 14 to control the speed during the intermittent action. The speed during continuous running is adjusted by another valve 15. Pins 23 on the second disc 24, in conjunction with the tail 20 of the valve 11, allow a spring switch 22 to fall on contacts 27 closing the circuit of microphones such as 28, Fig. 2. The slide valve 11 may also close the circuit of a bell 37 just before the microphone circuits are closed. When a microphone is actuated, it energises a solenoid 29 which rocks an anchor 30, allowing a disc 31 to be rotated half a revolution by a spring, and thereby to deflect a rudder 33. These parts return to their initial positions when the microphone ceases to be actuated. In a modification, the microphones control the rudders through a wheatstone bridge and a reversing-switch. The shaft of the motor 7 also drives a cam 17 through bevel-gearing 16, and this cam works a pair of jaws 18 for clamping the gyroscope 19 out of action while the microphones are in circuit. When the slide valve 11 is released by the pin of the disc 9, it is returned to the initial position by a spring 34, restarting the main engine 1; and the whole cycle of operations is repeated. To stop the engine when no sound is received, the slide valve 11 is checked by a pin 43 before it completes its stroke. The pin 43 is driven up in the path of the slide 11 by a screw connection with a wheel 42 driven by another wheel 41, which is itself driven by a rack on the slide 11. When sound is received by a microphone 45, it energises a solenoid 46, which pulls a double-armed lever 40, drawing the wheel 41 from the slide 11; a spring 44 then withdraws the pin 43, allowing the slide 11 to complete its stroke and the intermittent action to proceed. The lever 40 may be rocked to put the wheel 41 in and out of gear by means of a bell-crank 39, which is set by hand, or is controlled by a pin 49 on an adjustable friction disc 47 driven by clock-work or by gearing from the propeller shaft, in order to put the wheel 41 in gear after a given travel of the torpedo. For aircraft steered by seeing apparatus, the arrangement is similar, but the microphones are replaced by selenium or like cells. These cells may be made to receive one colour only, say red, by means of a condensing-lens and a prism, so that only illumination of the enemy aircraft by a searchlight with a screen of the same colour will affect the steering-devices. When a torpedo or aircraft is provided with both hearing and seeing devices, the seeing devices may be put in action when the engine is running and the hearing devices are out of action, or the seeing devices may be continuously in action. When seeing devices are used, the

ratchet-wheel 41 is definitely held out of action when once put out of action by the receiver 45. This is done by a spring 55, Fig. 4, adapted to engage a flat part 40^a on the double-armed lever 40; the spring 55 is put in and out of action according to the setting of a cam 56. The connections of the light-responsive cells are changed over for aircraft to be used in daylight.

106,352. Aeronautics. Parker, J. W., 22, Radnor Road, Harrow, Middlesex, and Abrahams, E. Goldsmidt, 5, Albany Court Yard, Piccadilly, London.

Propelling.—The internal-combustion engine of an aeroplane or other aircraft is supplied with producer-gas from a generator using anthracite coal, coke, charcoal, etc. The calorific value of the gas may be increased by injecting liquid hydrocarbon instead of or in addition to the water usually employed. The generator described in Specification 23476/01 may be used.

MARKET REPORTS.

Prices given are for quantities on usual terms.

July 19th, 1917.

COPPER.—The Copper situation is far from satisfactory, due to the American workers refusing to agree to the reduction of wages, which is the result of a reduction in the market prices in U.S.A. There is no doubt whatever that the Government officials here are partly responsible for this state of affairs. In the first place, prices were fixed at a high level, and competition was eliminated. Naturally, the U.S.A. producers took advantage of this. Now that America has joined the Allies, the U.S.A. officials are fixing prices at a normal level, with the grave results referred to above. It is difficult to foresee what will happen, but it is generally agreed that the officials here must modify their control.

Prices still remain unchanged.

Copper Ingot (Standard)	£130 per ton.
Copper Sheets	£165 per ton.
Copper Tubes, S.D.	20½d. per lb.
Brass Sheets, 24 Gauge	16⅛d. per lb.
Brass Tubes, S.D.	17d. per lb.

TIN.—The Tin market has witnessed an unforeseen and rapid reduction. It is doubtful whether this decline will continue, Nevertheless, buyers appear to be holding back. The position is most uncertain, and the market still retains its erratic tendencies.

Comparative Prices.

To-day	£236	10	0
July 16th	237	10	0
July 11th	245	0	0
Last Month	249	0	0
Last Year	166	10	0

LEAD.—Supplies still remain the chief consideration, and we are pleased to say that the hopeful feeling reported last week continues unabated.

For the guidance of readers, we give below a few of the maximum prices fixed by the Ministry on April 6th last.

Virgin Pig Lead	£29 per ton, ex Ship.
Virgin Pig Lead	30 per ton, ex Store
Scrap Lead	26 per ton, ex Store.
Nett.	
White Lead, Dry	46 per ton, D/D, U.K.
Red Lead	42 per ton, D/D, U.K.
Sheet Lead	39 10s. per ton, D/D, U.K.

STEEL.—There is very little to add to last week's report, except that vast extensions are now in hand, which will have a very favourable influence on supplies. The Air Board are tightening their control of Aircraft Steels, but they have not yet decided what the prices of the various Steels will be. We are anxiously waiting for this information; in the meantime, manufacturers should note the following abstract from Air Board instructions.

ALLOY STEEL.

"The Steel manufacturers have been instructed that they are not to accept any orders for Alloy Steel for aircraft purposes which have not been sanctioned by the Department of Aeronautical Supplies. Any orders sent to them by aircraft contractors will be returned to these contractors.

"All orders for Alloy Steel must be sent in triplicate to the Air Board, Hotel Cecil, addressed to the Controller of Aeronautical Supplies, and marked for the attention of the assistant director of materials and accessories, S. (M.A.) 5, the usual copies being also sent to the A.I.D. If an aircraft contractor has preference for a particular maker's Steel, such preference should be indicated on the order, and every endeavour will be made to meet his wishes. The contractor's order must state the number of the contract for which the Steel is required and the date by which delivery is desired. Material must, unless special permission to the contrary be given, in every case be ordered in standard sizes and to Air Board specifications.

"After receipt of the order the aircraft contractor will, in due course, be informed by the Department of Aeronautical Supplies when delivery may be expected, and from whom delivery will probably be made. When delivery instructions are given a copy of such instructions will be sent to the aircraft contractor.

CARBON STEELS.

"Triplicate copies of orders for Carbon Steel must also be sent to the Air Board for approval before being placed: but the orders for these Steels will be placed directly with the Steel firms and will be invoiced in the usual way by the Steel firms to the consignee."

The United States have made an agreement with Steel producers there, whereby the whole of the Steel output of all mills will be available for the American Government, who have agreed to allow a reasonable profit in the price, which will be fixed by the Federal Trade Commission.

Prices here remain unchanged, although there is a rumour that prices must be increased. It is certainly very unlikely that there is likely to be any decline.

Current Average Prices.

R.A.F. 3A	Steel, 38s. to 40s. per cwt., Basis.
R.A.F. 1B	Steel, 78s. to 80s. per cwt., Basis.
R.A.F. 9A	Steel, 32s. to 30s. per cwt.

ALUMINIUM.—Prices are unchanged, and supplies are very good.

Ingot	£225
Remelted	210

TIMBER.—This market still remains firm, and the issue of Admiralty stocks has not had any effect on merchant's prices, in fact, it is reported that the demands for Silver Spruce received by the Air Board exceed the stocks available, and there is very little to be obtained elsewhere. Shipments are very scarce owing to the impossibility of procuring shipping space.

We are strongly of the opinion that the powers that be do not realise how very serious the position is. Readers will remember that our respected Premier stated a short time ago that the Timber at present growing in this country was, if utilised, sufficient for our needs, and only a few days ago the late Minister of Munitions made the remarkable statement that the whole yearly output of Spruce produced in the United Kingdom was required, owing to the growth of the output of aeroplanes. This lack of knowledge of the requirements of this extremely important industry is very regrettable. The Government supplies of Mahogany and Walnut are available, but users appear to be a bit chary of the quality, and apparently prefer to pay a little more and have the liberty of selecting good wood.

Current Average Prices.

Silver Spruce, 17s., c.f.	
English Ash, 13s. 6d. to 15s., c.f.	
Walnut, 2s. 3d. to 2s. 6d., s.f.	
Mahogany, 2s. 2d. to 2s. 4d., s.f.	

Prices are for selection and delivery.

FABRIC.—Supplies are fairly satisfactory, but no official notification of the prices has yet been received, and the situation remains as reported last week.

THE U.S. STANDARD AIRCRAFT ENGINE.

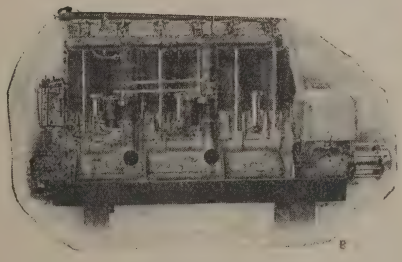
The National Advisory Committee for Aeronautics has announced that the Aircraft Production Board has obtained the co-operation of "two of the foremost engine designers in the country, Messrs Vincent and Hall," in the production of the U.S. Standard Aircraft Engine.

The fundamental idea of the engine is said to be a unit cylinder, from combinations of which any desired power may be obtained. It is proposed at first to build engines in four sizes of 4, 6, 8, and 12 cylinders, with corresponding horse-powers of 100, 200, 300, and 400.

It is said that the engine has been evolved with the voluntary co-operation of engine draughtsmen belonging to the leading aeronautical and automobile companies of America.

It is stated that the "assembly" of this engine (which apparently means erection from parts made in various factories) will be undertaken by the Bureau of Standards, an institution which apparently partakes of the nature of the National Physical Laboratory, very much enlarged.

Full advantage will be taken of the expert knowledge of metallurgy possessed by the staff of the Bureau. It is also announced that the development of the engine will in no wise interfere with, or retard, the development of private manufacturers, but that, if anything, it should stimulate them to further effort.



Which is much what we used to be told about the Royal Aircraft Factory, and was believed by some people, till they found their own ideas being embodied in R.A.F. designs, which were sent out to be reproduced by non-aeronautical firms, while the originators of the ideas were left waiting for orders.

C.D.C.

A NEUTRAL'S IMPRESSION OF AMERICAN AIRCRAFT.

BY A DANISH CORRESPONDENT.

When the liner passes the statue of Liberty, and you stand at the end of your journey, or the start of your aviation mission, you have as a genuine European an idea of American pre-war aviation as consisting of modest orders for the aircraft "works" of freak planes for death-challenging exhibition flights, and a total lack of the all-important Government backing.

As a traveller of war you are not spoiled by facilities afforded to acquaint yourself with the newest aircraft, so as a contrast, curious in world wartime, and even in the eleventh neutral hour of the country, the Pan-American Exposition was an easy chance of observing many of the newest United States aviation products

And your impressions? Coupled with the idea you got of the American aircraft trade by visits at the various works of note, you answer quick: "America was at the start of 1917 where Germany was in 1913."

And rather otherwise than grumbling at the difference of three to four years the comparison with Germany should be taken as a compliment. A clever policy of money backing was the keynote to German aviation successes up to the outbreak of war. Now large foreign orders and the establishment on large lines of a national Air Service as the result of an energetic agitation of the American Aero Club have rendered the establishment of the United States aircraft trade on a sound financial basis possible. Where German aviation is to-day ahead is in the refinements, and development from the mutual war competition with the best Allied brains, and this is but a question of time, where Uncle Sam can, from his period of neutrality, afford to pay for tuition, and even get it cheap, if extracting the right lesson from the mistakes committed by the European belligerent countries.

Which is, then, the foundation on which to build up an American aircraft trade? Whether you prefer to give Wright or Curtiss first mention is a question of primogeniture or present leadership. American aviation workmanship was pretty poor before, i.e., up to the last days, maybe, owing to the costly labour of the New World, and here is where the largest progress has taken place. For beyond individual criticism of detail work you can have no objections against the products of the six main pillars of the show, and too of the American aviation industry, namely the aviation firms: Aeromarine, Curtiss, L.W.F., Standard, Thomas, and Wright-Martin. And in letting this row pass review the German allusion turns up again, for not only the conditions of development favour a comparison with Germany, even the appearance of above-mentioned products are distinctly German.

Next to bad construction, the former worst obstacle to progress was apparently the patent controversy, and as America's entry into the war demands now quick settlement, the practical Americans have by bill set a million dollars aside for a money decision of the question, with knowledge where the shoe pinches with a British ante-going procedure of remedy as a model, and with the case simplified by the U.S. Government as only customer.

For well was the policy of the Wright Co. on one side to get handsome royalties from the other aeroplane firms, and even the Curtiss flying-boat patents were here no equivalent, the results being that new companies were hampered in their activities, and the final effect was that the finished product in the end enhanced the amount of the royalty to the chief customer: the Government. But, on the other hand, the Wright Co. adopted too a clever manufacturing policy to enter into competition with the Curtiss concern.

To this end the Wright-Martin Corporation is to-day the owner of a well-combined and well-equipped ring of plants. In the West on the Pacific coast the Glenn L. Martin manufacturing factory, in Dayton the original and experimental Wright works, and on the Atlantic coast the high grade Crane-Simplex automobile works, where the Hispano-Suiza aero-engine is made.

At the show the exhibits included the original Wright biplane of 1903, a Martin Hall-Scott engined tractor biplane, the beautiest finished to be seen there, and a grey Hispano-Suiza engined Wright-Martin biplane, just finished, and not looking all too pleasant in design with its long body. Of motors, the Hispano-Suiza was seen in two editions, the 150 h.p. V type model and a four-cylinder 75 h.p. vertical motor with a single block.

The Curtiss Corporation can not easily be challenged as the world's largest aircraft concern, and both a view of their stands and visits at their works give evidence to the variety of work. Within the range of the limits from the tiny triplane scout, over the battleplane twin-engined Farman type and fuselage type tractors to the Super-America enclosed flying-boats, and within the string of nomenclature of engines, a fair selection was shown, yet the most interesting types, the very latest machines, were worshipped by being withheld from the general inspection of an exhibition, whereas the foremost idea of the "cry" of the stands, a totally enclosed aero limousine, is to be of show attraction, being a combination of the wings from the triplane with the tail longerons of the "Canada" model and with an enclosed light car with tandem seat arrangement, the driver being in front, with two passengers aft, and the 100-h.p. motor situated under the bonnet as in general car practice with a shaft-cum-chain drive of the four-bladed pusher propeller.

Sound work was shown at the stands of the Thomas-Morse Aircraft Corporation and the L.W.F. engineering company, the former's exhibits being a tractor biplane, the 135-h.p. V-type motor and the same type in 150-h.p. sound aluminium edition, the latter firm showing a Thomas-engined biplane with laminated wood fuselage, though the coincidence in initials do not explain away the derivement from the three founders of the company, the one being now chief designer of the Aeromarine firm, Mr. Willard, who claims intimate knowledge of British aviation, since his father invited Mr. A. V. Roe over the pond in ye old days. Following now a steady course, this company produces at its two plants both six and twelve cylinder motors, and exhibited a pleasant lined biplane, shown without engine.

The Standard Aero Corporation, successors to the Sloane Co., showed their biplane to the design of their chief engineer, Mr. Day, being, with its arrow-shaped planes and general robustness, more like a pre-war German product than anything else. Ugly and unpractical is the chimney-like front radiator used for this biplane and other American aircraft too.

The Burgess Co., of boat builder fame, was represented by a Dunne seaplane, and the Benoist company by a not too carefully designed boat, but the rest of the aeroplane exhibits, and thus the Cooper, Pierce, Robin Hood, and Wittemann, belonged to the category of freaks familiar from European ante-war aero-shows, being poor either in design or construction, or both.

Of aero engines, beyond those already mentioned, were the Knox 300-h.p., a fine-looking though somewhat heavy piece of work; the Sturtevant, the two factories bearing this name being only represented by engines; the 150-h.p. and 300-h.p. Duesenberg engines, giving evidence of brain work; the Packard V-type motor, too, having the requirements for developing into a first-class aviation motor; the Roberts two-cycle, the Wisconsin, and a number others, being but single editions of their inventors' ideas.

The accessory department bore evidence to the manufacturers in the automobile line and others being live aware of the possibilities opening in the aircraft field. Foremost the various products of the Sperry company must be mentioned, also the Herbert and Huesgen aerial photography apparatus, developed by Captain Bass, and the Roebling wires. And one could not abstain from thinking that in the intensive work to come in the American aircraft trade an "Aircraft Supplies Co." transplanted on United States ground should turn out of mutual benevolence.

From the American working ideas I will mention one small instance not familiar in European practice, that for lining the sewing over the ribs on the planes a woven cover is employed, as the dope sticks thus better to the cover and prevents it from loosening when getting wet.

Further, I must quote the text of a signboard in the Standard Aero Works: "Workmen! if you spit at home, do so here, too. We want you to feel at home."

And finally, in confessing belonging to one of the few neutral countries left, which means even speaking a non-English tongue, my object is on one side to ask excuse for poor expression, and on the other to thank one and every single, from works managers to the aviation papers' editors and Aero Club officials, for kind attention and hospitality, second to none of the old world—before the war.—H.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

The Birth of a Great Seaplane.

By One Who Watched It.

If you have ever watched the launching of an ocean-going liner, you cannot have been insensible to a certain feeling of pride that sways all spectators as the huge shape plunges into its natural element for the first time. So, too, the launching of a great modern seaplane to-day, in all its beauty of form, awakens emotions of pride and satisfaction not only in the breast of its ingenious inventor, but also in the breasts of the workmen-spectators who have all contributed the skill of their hands.

But there are two main distinctions between the ceremonies attending the birth of marine and supermarine craft. The career of a liner is begun under conditions which, if they have not lost their thrill, are, at least, shorn of much of their novelty; and such a launch is a public event of no small local importance. On the other hand, the mammoth seaplane is a recent creation—a product of the war, in fact, that makes its debut under a veil of mystery. Hence, the ceremony of its christening, commonly called the reception test, takes place without the limelight of publicity.

There is, however, plenty of stir for the army of builders and mechanics.

At last, the scaffolding which has hidden the seaplane like a spider in its web, comes down; and we have disclosed to our view a giant bird which is something of a cross between St. George's Dragon and the fighting Martian visualised by H. G. Wells.

Viewing the machine from a high gallery alongside, one may be pardoned for asking, "But will it fly?" That is a question as natural to your mind as is another question put by the inventor, "Will it do its performance?" That, translated into popular parlance, is, "Will it rise off the water in the distance calculated; will it climb up into the air at the rate of —— feet per minute which an exacting Government have stipulated; and will it do a certain lightning speed at a certain altitude up above the clouds?"

A mass of technical factors are involved in these vital questions which this inventor has put to himself almost daily for several months past. He is a rather young-looking fellow, with clever grey eyes and clear-cut features that bespeak a highly-strung but courageous temperament; and by his mixture of genial wit and firmness of command, you feel you can discern in him one of England's foremost aeronautical engineers. His workmen are loyal, obedient, and even affectionate in their devotion; and they feel that while always encouraging their initiative, he is one of those few master-minds who know what they want and will brook no difficulty, technical or departmental.

The great shed that harbours the giant bird has throbbed with excitement the clock round. Naval officers and mechanics seem to be hustling as if the issue of the war depended on their efforts that day. On all sides of The Thing they cling like bees after honey. Heads pop in and out of the fore and aft cabins, tanks are being filled with what seems endless streams of petrol and oil; and then, suddenly, the word goes round that all is ready.

Workmen climb down and stand aside, ladders and other obstructive tackle are moved away, and the small crew proceed to take their seats. The pilot and a Naval officer, who is rather American in aspect but British to the bone, appropriate the two back cockpits.

Four strong men at the winch commence to wind a steel rope, and The Thing, riding on a long, low metal truck or bogey, commences to move slowly along a railway of 20-foot-gauge. In this way the slipway leading to the water's edge is reached.

Then comes a pause. The giant bird, like an animate thing that has now drank in the breath of life, sets up a deafening noise. The engines have started. Cranked by the men on board, they are "ticking round," and the propellers raise a veritable gale for onlookers standing near the tail. The only uncomfortable person, however, is the starboard cranker, who was holding on to the exhaust-pipe to get a firm grip, and found it got hot too quickly.

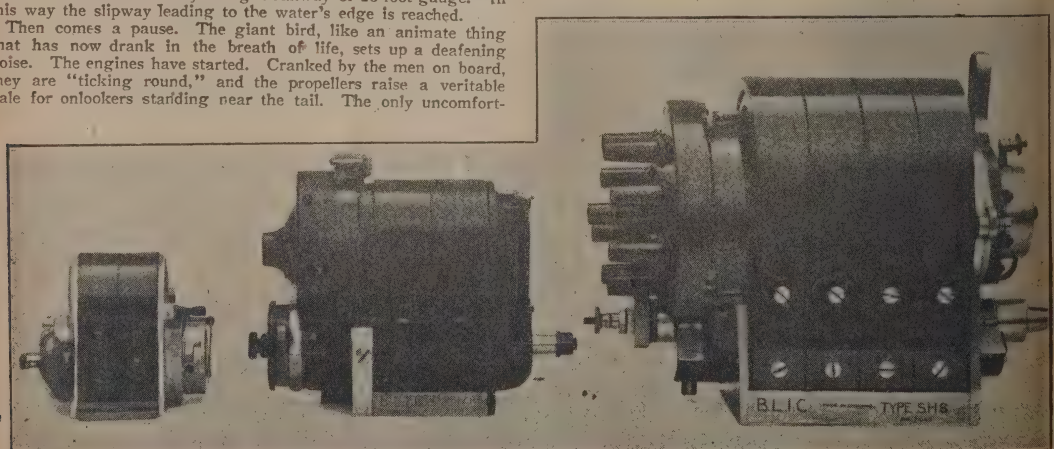
The monster is let down the slipway till she floats clear of the bogey; and the Chief Pilot assumes undisputed command. He opens the throttle, there is an almost frightening roar, long sheets of white spray are shooting from the sides of the floats. She is off!

The enthusiasm is infectious. The inventor, phlegmatic and austere, is drawn to join in the applause, though his tense features relax but little as yet. He is on the alert to catch a reassuring signal from the pilot who has found the craft so airworthy that he has let go all the controls. His signal is that the machines natural stability, even in a wind, is wonderful.

The waving and shouting and the barking of the foreman's dog continue until the seaplane has risen high in the cloud-flecked sky, and now appears like a silent comet pursuing its dizzy course.

Half an hour of suspense drifts by while we discuss our estimates of the "climb" and speed on even keel. Then the hum of the engines once more becomes audible, and ripens very soon into the old nerve-racking roar. The machine seems to get bigger and bigger as it lowers its altitude, and the next minute sees a safe descent on the choppy sea, and the weather-beaten pilot is "taxi-ing" his charge to the slipway up which it is hauled by the army of enthusiastic workmen.

"How did she behave?" is the question put a hundred times to the leather-jacketed pilot. "Did her climb fine!" "Plenty of power to spare." "A topping 'bus," are fragments of the replies we hear.



The Naval Inspector is busy making his notes on the speeds attained at different altitudes and the rates of climb, and on other Admiralty secrets; and from the smile that spreads over the now relaxed features of the designer, we gather that the launch and test have even exceeded his own calculations, and that the British nation have received from him a new Hun-strafer of exceptional capacity.

ITALIAN TRADE NOTES.

As if to accentuate the good impression made by them at the recent exhibition, one of the Colombo motors mounted on a Savoia-Farman has been home-record breaking down south. 5970 metres, in full warpaint, as required by the regulations, is said to have been thought a great deal of by those whose business it is to know just what weight was on board the machine.

Among other "accessory" stands with which I hope to deal more fully when space is less rare, I must mention that of the Italian Bowden patents. Practical proofs of its invaluable help in getting power round corners was shown by weight-lifting and other working installations. After the i.c. engine, this patent is about the most useful thing that has happened along for flying people.

The Ansaldo Co. announce that they are going to turn out the biggest thing in the way of seaplanes that Italian genius has been able to devise. Their advert. mentions that the works at Borzoli are the biggest in the world.—T. S. H.

A KEY INDUSTRY.—Products of the British Lighting and Iginition Co., Ltd., of 204, Tottenham Court Road, W.1—commonly known as the Blic. On the left is a light-weight Blic Magneto, motor-cycle type. In the middle is a six-cylinder Blic, for an aero-engine, and on the right is an eight-cylinder Blic, for a stationary engine.

(*Continued from page 230.*)

tacked one, and fired 60 rounds into its cockpit at point-blank range, the enemy machine rolling over and over for 3,000 ft., and then falling vertically out of control. He then attacked another enemy machine, which had dived onto one of our machines from behind, and with the help of a scout he shot it down, the enemy being seen to crash to the ground. Another hostile scout was then attacked by pilot, end-on, and received a long burst at very close range, the enemy going down in a spin, but apparently righting himself lower down. During this last encounter Flt. Comdr. Gerrard's machine was riddled with bullets, but, by fine piloting, he landed safely, although all but his lateral controls were shot away, and his machine damaged to such an extent as to require return to depot for complete rebuilding. This officers has now destroyed at least seven hostile aircraft. He was on active service in France and Belgium from April to September, 1916, and during that period performed much valuable work.

Flt. Comdr. Reginald Frederick Stuart Leslie, R.N.A.S.

In recognition of his gallantry in pursuing hostile raiding aeroplanes out to sea in a land machine on May 25th, 1917. He attacked one hostile aeroplane, and caused it to descend in a steep nose-dive, emitting smoke and steam. He was unable to observe its fate, as he was himself immediately attacked from behind by two other hostile machines and temporarily lost control. When he regained control, the machine which he had first attacked had disappeared, and two others were proceeding eastwards at a considerable height above him. He then returned safely to his aerodrome.

Flt. Lt. Guy Duncan Smith, R.N.A.S.

In recognition of his services in the East Indies and Egypt Seaplane Squadron during the period April 1st, 1916, to March 31st, 1917. During this time he took part in several valuable reconnaissances and bombing flights, obtaining important information, and doing considerable damage to enemy organisations.

Flt. Lt. Raymond Collishaw, R.N.A.S.

In recognition of his services on various occasions, especially the following:—On June 1st, 1917, this officer shot down an Albatros Scout in flames. On June 3rd, 1917, he shot down an Albatros scout in flames. On June 5th, 1917, he shot down a two-Albatros Scout in flames. On June 5th, 1917, he shot down a two-two Albatros Scouts in flames, and killed the pilot in a third. He has displayed great gallantry and skill in all his combats.

Flt. Sub-Lt. Norman Richard Cook, R.N.A.S.

For his services in an air raid on Zeebrugge Mole and hostile shipping, on May 27th, 1917.

Flt. Sub-Lt. Robert Frederick Lea Dickey, R.N.A.S.

Warrt. Officer (2nd Grade), Frank Henry Whitmore, R.N.A.S.

In recognition of his services in the East Indies and Egypt Seaplane Squadron during the period April 1st, 1916, to March 31st, 1917.

* * *

The following awards have also been approved:—

To Receive the Distinguished Service Medal.

C.P.O. Mech., 3rd Gr., Frederick Cusden, O.N.F.5011 (Po.); Air Mech., 2nd Cl., Henry Martineau Davis, O.N.F.20254; Air Mech., 1st Cl., Arthur William Goody, O.N.F.12237.

* * *

The following Officers and Men have been mentioned in dispatches:—

Flt. Lt. Edward James Pointer Burling, R.N.A.S.; Flt. Lt. Humphrey de Verd Leigh, R.N.A.S.; Flt. Lt. Frederick Middleton Fox, R.N.A.S.; Flt. Lt. Henry Vernon Worrall, R.N.A.S.; Flt. Lt. Thomas Gordon Mair Stephens, R.N.A.S.; Flt. Lt. John Edward Scott, R.N.A.S.; Flt. Sub-Lt. Rowan Heywood Daly, R.N.A.S.; Lt. William Charles Abbott Meade, R.N.V.R.

* * *

The King has been pleased to approve of the award of the following Medals to Officers and Men for services in action with enemy submarines:—

To Receive the Distinguished Service Cross.

Flt. Lt. John Edward Alfred Hoare, R.N.A.S.
Flt. Sub-Lt. William Louis Anderson, R.N.A.S.

To Receive the Conspicuous Gallantry Medal.

C.P.O. Mech., 2nd Gr., John Frederick Tadman, O.N. 271984 (Ch.)

For conspicuous gallantry in climbing out on the wing of an aeroplane to plug a leak in the radiator. He remained in this position for a period of 20 minutes, thus enabling the aeroplane to return safely to her base.

To Receive the Distinguished Service Medal.

Air Mech., 2nd Gr., D. R. Chapman, O.N., F.13487.

* * *

The following Officer is mentioned in dispatches:—

Sqdn. Comdr. Ralph James Jean Hope-Vere, R.N.A.S.

* * *

FOREIGN DECORATIONS.

The following Decorations have been conferred by the Allied Powers on Officers of the British Naval Forces for distinguished services rendered during the war:—

THE QUEEN WITH THE R.F.C.—Her Majesty and General Trenchard, G.O.C. R.F.C. in France. The cowling of the handsome machine on the left will be familiar to students of aviation.

CONFERRED BY THE PRESIDENT OF THE FRENCH REPUBLIC.

CROIX DE GUERRE.

Flt. Comdr. John D. Newberry, R.N.A.S.; Flt. Comdr. Frank Fowler, D.S.C., R.N.A.S.; Flt. Comdr. Charles C. R. Edwards, D.S.C., R.N.A.S.; Flt. Comdr. Charles D. Booker, D.S.C., R.N.A.S.; Flt. Comdr. Alexander M. Shook, R.N.A.S.; Act. Flt. Comdr. Henry G. Olden, R.N.A.S.; Flt. Lt. George G. MacLennan, R.N.A.S.; Observer Lt. Eric B. C. Betts, R.N.A.S.; Flt. Lt. Robert A. Little, D.S.C., R.N.A.S.; Flt. Lt. John E. Sharman, D.S.C., R.N.A.S.; Lt. Hector A. Furniss, R.N.V.R.; Lt. Russell W. Gow, D.S.C., R.N.V.R.; Flt. Sub-Lt. James A. Glen, R.N.A.S.; Flt. Sub-Lt. Walter E. Flett, D.S.C., R.N.A.S.; Observer Sub-Lt. Charles K. Chase, D.S.C., R.N.A.S.

CONFERRED BY THE KING OF ITALY.

ORDER OF THE CROWN OF ITALY.

OFFICER.

Wing Comdr. Ivon T. Courtney, R.N.A.S. (Capt. and temp. Lt.-Col., R.M.L.I.)

CONFERRED BY THE KING OF BELGIUM.

ORDER OF LEOPOLD.

OFFICIER.

Capt. Charles L. Lambe, D.S.O., R.N.

CHEVALIER.

Wing Comdr. Spenser D. A. Grey, D.S.O., R.N.
Sqdn. Comdr. Edward T. Newton-Clare, D.S.O., R.N.A.S.

WAR OFFICE, July 21st.

REGULAR FORCES—ESTABLISHMENTS.—R.F.C.—MIL. WING.—Flt. Comdr.—Sec. Lt. (temp. Lt.) F. W. Winterbotham, Yeo., T.F., from a Flying Officer, and to be temp. Capt. while so empld., July 10th.

Equipment Officers, 1st Cl.—Sec. Lt. (temp. Lt.) H. J. C. Smith, Spec. Res., from the 2nd Cl., and to be temp. Capt. whilst so empld., June 1st. 2nd Class.—From the 3rd Cl.—Capt. A. L. Gregory, M.C., Dorset R., Spec. Res., July 1st. And to be temp. Lts. whilst so empld.:—Sec. Lt. T. P. Whitcomb, Essex R., T.F., temp. Sec. Lt. A. S. Poynton, R.E., Sec. Lt. H. Straker, Spec. Res., July 1st; Sec. Lt. C. Lambert, Spec. Res., July 2nd. 3rd Class.—Lt. McRae, Canadian Mil. Forces, May 3rd; Temp. Sec. Lt. (on prob.) R. J. Murchison, Gen. List, and to be confirmed in his rank, June 20th; Temp. Sec. Lt. S. W. Gilbey, A.S.C., and to be transfd. to Gen. List, July 2nd; Temp. Sec. Lt. (on prob.) S. Williamson, Gen. List, and to be confirmed in his rank, July 3rd.

Gen. List.—From R.F.C. to be temp. Sec. Lts., June 26th:—1st Cl. Air Mech. McLeod Neville Staight, 1st Cl. Air Mech. H. G. Toyé, Gnr. P. Seymour, Cpl. S. P. Tigg, 2nd Cl. Air Mech. B. Z. Simpson, Flt.-Sgt. E. C. Robinson, Sgt. H. Haworth. To be temp. Sec. Lts. (on prob.):—J. K. Bell, C. E. Maryon, H. L. B. Buchanan, June 29th; H. Smith, July 12th; Sgt.-Maj. S. G. Williams, from R.F.C., July 4th.

WAR OFFICE, July 23rd.

REGULAR FORCES—ESTABLISHMENTS.—R.F.C.—MIL. WING.—Staff Officer, 3rd Cl.—(Graded for purposes of pay as a Staff Capt.)—Capt. W. G. M. Crothers, Suff. R., Spec. Res., vice Capt. A. W. A. Harker, R.G.A., June 4th.

MEMORANDUM.—Capt. T. W. C. Carthew, D.S.O., from Bedf. R., Spec. Res., to be temp. Capt., Gen. List, July 24th, with sen. from April 9th, 1910, and to retain the temp. rank of Lt.-Col. while empld. as a Wing Comdr., R.F.C., July 24th.

The undermentioned to be temp. Capts.: Temp. Lt. E. E. Jackson, June 5th, 1917.—Temp. Sec. Lt. C. T. Cleaver, M.C., Gen. List, for duty with R.F.C., July 24th, 1917.

* * *

The following name is added to the list of officers, non-commissioned officers and men recommended for distinguished and gallant services and devotion to duty in the dispatch from the Field-Marshal Commanding-in-Chief, the British Armies in France, dated April 9th, 1917, which was published in the "London Gazettes" dated May 15th, 18th, 22nd, 25th, and 29th, and June 1st, 1917:—

Pashley, Sec. Lt. E. C., R.F.C., Spec. Res. (killed).

FROM THE COURT CIRCULAR.

BUCKINGHAM PALACE, July 18th.

The following Officer had the honour of being received by the King, when His Majesty invested him with the Insignia of Companion of the Order into which he has been admitted:—

THE DISTINGUISHED SERVICE ORDER AND THE DISTINGUISHED SERVICE CROSS.

Squadron Commander Charles Butler, R.N.A.S.

The King then conferred decorations as follows:—

THE DISTINGUISHED SERVICE CROSS.

Squadron Commander Eric Nanson, R.N.
Flight Lieut. Lionel Shoppee, R.N.A.S.
Flight Lieut. Leslie Brown, R.N.A.S.
Flight Lieut. Stewart Dawson, R.N.A.S.

THE MILITARY CROSS.

Lieut. Valentine Baker, R.F.C.
Lieut. J. Belgrave, Oxf. and Bucks L.I. and R.F.C.
Lieut. Richard Fitton, R.F.A., attd. R.F.C.

* * *

BUCKINGHAM PALACE, July 21st.

The King, who was accompanied by Field-Marshal the Duke of Connaught and Admiral the Marquis of Milford Haven, held an Investiture in the Forecourt of the Palace, when he received the "Next-of-Kin" of deceased officers and men, and handed to them the Victoria Crosses which had been awarded in the war to their relatives. The following were present:—

Mr. and Mrs. Albert Ball to receive the Victoria Cross awarded to their son, Captain Albert Ball, late The Sherwood Foresters and R.F.C.

NAVAL.

The following appointments have been made in the Royal Naval Air Service:—

JULY 17th.—Comdr.—E. A. D. Masterman, promoted to Act. Capt., seny. July 14th.

Temp. commissions as Lt. (R.N.V.R.) have been granted to W. G. Chapman and J. K. Hoyle, seny. July 16th.

JULY 19th.—Flt. Lt. (temp.).—S. P. Martin, granted a temp. commission as Lt. (R.N.V.R.), seny. April 1st.

JULY 20th.—Flt. Lt. (Temp.).—L. A. Hervey, promoted to Flt. Comdr. (temp.), seny. June 30th.

Temp. commission as Lt. (R.N.V.R.) have been granted to the following, seny. as stated:—W. H. Clegg, July 16th. J. Chapman, July 17th. W. Pollock, July 18th. J. R. Craig and D. R. Parry-Jones, July 19th.

JULY 23rd.—Temp. commissions as Lt. (R.N.V.R.) have been granted to W. H. Mainprize, B.A., and E. W. Cook, seny. July 19th and 21st.

THE CASUALTY LIST.

Reported July 18th.

KILLED.—Mitchell, W. L., P.O. Mech., F.10045.
DIED OF WOUNDS.—Edwards, W. J., Ldg. Mech., K.10970.

Reported July 19th.

ACCIDENTALLY KILLED.—Bryans, Flt. Sub-Lt. F. M., R.N.
Daly, Flt. Sub-Lt. D. H., R.N.
MISSING.—Bray, Flt. Sub-Lt. F., R.N.
WOUNDED.—Philip, Flt. Sub-Lt. L. A., R.N.
PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—Mackenzie, Flt. Comdr. C. R., D.S.O., R.N.

Reported July 20th.

KILLED.—Begg, Flt. Sub-Lt. R. G., R.N.
Planterose, Observer Sub-Lt. E. A., R.N.
ACCIDENTALLY INJURED.—Warne-Browne, Prob. Flt. Officer T. A., R.N.

Reported July 23rd.

KILLED.—Waterlow, Wing Comdr. C. M., R.N.
MISSING.—MacLennan, Actg. Flt. Comdr. George G., R.N.
Akers, Flt. Sub-Lt. Frederick W., R.N.
Kent, Flt. Sub-Lt. Raymond L., R.N.
SLIGHTLY WOUNDED.—Glaisby, Flt. Sub-Lt. Lacey N., R.N.

PERSONAL NOTICES.

DEATHS.

BEGG.—Flt. Sub-Lt. Rivers Gordon Begg, R.N., who was killed on July 17th, was the son of Mr. and Mrs. H. C. Begg, Beechfield, Langley Road, Watford, and formerly of Calcutta.

CROWE.—Flt. Sub-Lt. H. Lawrence Crowe, R.N., whose death on June 22nd in an accident to the machine which he was flying, has already been announced. Mr. Crowe was a son of Mr. and Mrs. Harry Crowe, of Toronto, Canada, was a graduate of St. Andrew's College, Toronto, and qualified for his pilot's certificate at the Curtiss Aviation School, Newport News, Virginia, U.S.A. He was on special patrol duty when he was killed. An officer under whose command he had served writes of him that he had "always cherished a very warm memory of him. . . . The Service has suffered a real loss in this officer. His loss has been a real blow to myself as well as to other officers in the . . . station. . . . I hoped that despite his youth he would soon get promotion."

MACKENZIE.—Flt. Comdr. Colin Roy Mackenzie, D.S.O., R.N. (previously reported missing, now reported killed), was awarded the D.S.O. last October in recognition of his skill and gallantry in destroying a German kite balloon on September 7th, 1916, under very severe anti-aircraft fire.

OLDBURY, BIRMINGHAM.

TUBES
FOR AIRCRAFT.

NICKEL STEEL.

CHROME NICKEL STEEL.

CARBON STEEL.

Nearly 800 special sections, illustrated full size.

IMPORTANT TO AEROPLANE BUILDERS.

To those building or tendering for Aeroplanes it might interest them to know that we hold complete tools for many of the components of the following machines:

B.E.2C-D-E & B.E.12. R.E.7 & R.E.8.
F.E.2B & D. F.E.8. S.E.5.
SOPWITH (110 h.p. CLERGET & F.I.).
AVRO, BLERIOT and H. FARMAN.

All kinds of tube manipulation can be effectively dealt with at our works.

We also have excellent facilities for coping with

PRESSWORK, SOCKETS, FERRULES, TUBULAR OR SHEET-METAL FRAMEWORKS.

Please send details of your wants.

The work at present in hand for the above includes RUDDERS, FINS, ELEVATORS, STAYS, SOCKETS, CLIPS, LEVERS, EXHAUST SETS, WIRING PLATES, &c.

A complete up-to-date list of parts in stock or in progress will be sent on application.

WE MAKE ALL SIZES AND TYPES OF TUBULAR BOX SPANNERS.

MORRISON.—Flt. Sub-Lt. Ronald Beckett Morrison, R.N., who was accidentally killed while flying in England on July 12th, at the age of 22, was the only son of Mr. and Mrs. John Morrison, of Dunthorpe, Bickley, Kent. He was educated at Charterhouse, and on leaving there entered the works of an engineering firm. When war was declared he joined the R.N.A.S. as a dispatch rider with the armoured cars, and went to Belgium at the beginning of October, 1914, since when he served continuously in France and Gallipoli until he returned to England in February, 1916.

He was given a commission as Flt. Sub-Lt. in June, 1916, qualified as a pilot, and went out to the front again in December, and remained there until early in July this year, when he returned to take up a home appointment.

ORFEUR.—Observer Sub-Lt. Charles Bernard Orfeur, R.N., who died of wounds on July 1st, was the second son of Mr. and Mrs. Charles E. Orfeur, Colchester. He was in his 26th year.

PLANTEROSE.—Sub-Lt. E. A. Planterose, R.N., killed on July 17th, was the eldest son of Mr. and Mrs. George Planterose, of 8, East Drive, Brighton. He was 24 years of age.

WATERLOW.—All will learn with very deep regret of the death of Lieut.-Colonel Clive Waterlow, R.E. (Wing Comdr., R.N.A.S.), whose death appeared in the Naval casualty list of July 23rd. Clive Waterlow was a Sapper officer fairly fresh from the Shop when he joined the old Balloon Company R.E. in the dim days before there was any flying. He remained faithful to aerostation throughout his subsequent career and took but a casual interest in aviation.

In the Balloon Company he became, in the natural course of events, concerned with airships, and so worked with Major (now General) Capper and the late S. F. Cody on the earliest Army airships. I believe he was, in fact, one of the crew of the famous "Nulli Secundus" in her voyage over London in 1909. Thereafter he was largely responsible for the Army airships which followed. Though not O.C. of the Airship Section of the Air Battalion, R.E., nor of the Airship Squadron, R.F.C., he was, perhaps, the officer most deeply learned in the science and practise of aerostation and as such he was in many ways the moving spirit of the Army airships.

None knew more about the peculiar properties of hydrogen, or the qualities of fabric for envelopes, or the various other things which seem so mysterious to the student of the plain, straightforward aeroplane. At the same time, none could handle an airship better, nor was more skilful in avoiding what seemed likely to be serious accidents.

Perhaps the highest personal tribute paid to the late officer's skill was when he was selected by Captain (now Colonel) Maitland to pilot the little airship from which he made his famous parachute descent into Cove Pond, the first parachute descent ever made from an airship. His skilful handling of an experimental Army airship, the frame of which began to break up in the air, chiefly owing to its having been constructed to the designs of the scientists of the Royal Aircraft Factory, has long been historical among the older airship pilots.

When the Army very foolishly lost interest in airships and handed over its little experimental vessels, with their personnel, to the Navy—with the natural result that they had to borrow balloon experience back again afterwards—Clive Waterlow adhered to his faith in lighter-than-air craft, and transferred with them. Since then he has continued to do work of very high value, both in airship experiments and in the training of personnel, besides finding time in which to deliver a number of most interesting lectures to members and students of the Aeronautical Society on the construction and use of airships.

Apart from his professional duties, Clive Waterlow had many interests and activities. He was an executive musician of considerable ability, and a composer of distinction. For all his knowledge and high technical ability, he had the heart of a child, and children loved him. In his Aldershot days he wrote several fairy plays, which he produced for local charities. These plays were produced entirely by him; he trained the children of the chorus, taught the juvenile principals their parts, wrote the libretto, composed the music, stage-managed the performance, and, I believe, painted the scenery. They were completely successful and very beautiful performances. If he had not been a Sapper officer and an airship enthusiast he might have produced another Peter Pan, and, as it is slightly doubtful still whether Count von Zeppelin or Sir J. M. Barrie is the greater benefactor to humanity, it is likewise doubtful whether Clive Waterlow's work as an airship officer has not interfered with still greater possibilities.

Only on June 9th last Colonel Waterlow was married to Miss Joan Clare, and the deepest sympathy of all will go out to his young widow, a wife for so brief a time. The manner of his death is not officially announced, but one assumes that it happened in connection with an airship experiment of some kind, and doubtless through another person's mistake. His death at the early age of 31—he was born in London on September 9th, 1885—deprives the Army of a notable officer, for though he lost his life in the senior, albeit the minor, Service he remained an officer of that distinguished regiment, the Corps of Royal Engineers.—C. G. G.

ENGAGEMENTS.

BROWNE—CAPPON.—The marriage of Flt. Lt. (acting Lt., R.N.), Chetwode W. C. Browne, R.N., only son of Mr. and Mrs. Willis Browne, The Beeches, Caterham, and Dorothy Janet, younger daughter of the late James Cappon, of Fife, and of Mrs. H. Goodman, Banavie, Caterham, will take place at St. Mary's Church, Caterham, at 2.15 p.m. on Tuesday, August 7th. All friends will be welcome at the church.

MILEY—LEGAL.—The marriage arranged between Sqdn.-Comdr. A. J. Miley, R.N., only surviving son of Dr. and Mrs. Miley, Haven Hill, St. Mary Bourne, Andover, and Mlle. Roberte Legal, youngest daughter of M. and Mme. Legal, Château de Tulock, Guérande, France, will take place at St. George's, Bloomsbury, on Monday, July 30th, at 12 o'clock. All friends will be welcome at the church.

BIRTH.

CHAPMAN.—On July 13th, at 89, Lancaster Gate, W., the wife of Flt. Lt. C. H. Murray Chapman, R.N., of a daughter (stillborn).

Lt.-Col. Sir H. Montagu Allan, C.V.O., Lady Allan, and Miss Martha Allan wish to thank all their friends in Britain and Canada for the sympathy expressed at the death on active service of Flt. Sub-Lt. Hugh Allan, R.N. They hope, in due course, to acknowledge personally the many letters, telegrams, and cables which they have received.

* * *

The relatives of Flt. Sub-Lieut. R. L. Kent, R.N., who has been missing since July 11th, will be glad if any information concerning him is sent to Mr. Kent, 2, Kelross Road, N.5.

* * *

Flt. Sub-Lt. Bertram A. Trechmann, R.N.A.S., who was officially reported as having died at Constantinople on June 3rd, is now (privately) reported to be well on June 20th, and as having been sent from the hospital in Constantinople to Kutayah in Asia Minor, as a prisoner.

MILITARY.

G.H.Q. COMMUNIQUÉS.

JULY 17th, 8.58 p.m.—Although handicapped by thick clouds and strong winds, our aeroplanes carried out a great deal of successful work yesterday in conjunction with our artillery, and in addition our raiding machines dropped a large number of bombs on various points of military importance behind the enemy's lines.

In the evening many fights took place in the air, as the result of which six enemy aeroplanes were brought down, one of which was forced to land in our lines, and three others were driven down out of control.

None of our machines is missing.

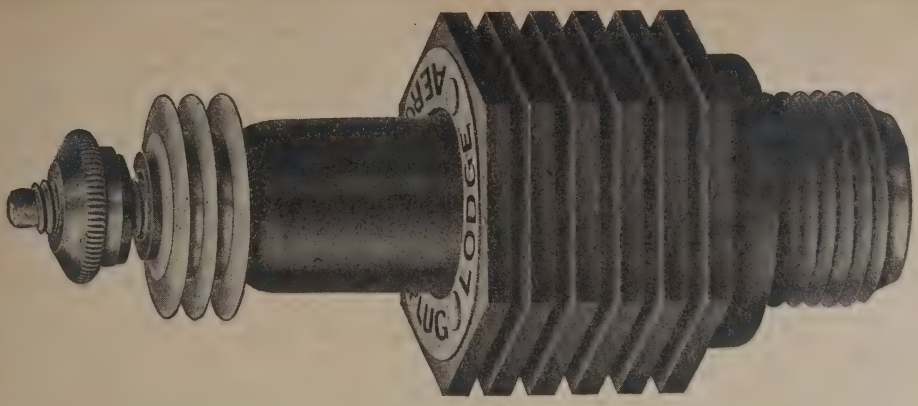
JULY 18th, 8.45 p.m.—Owing to the clouds there was little aerial activity yesterday until the evening, when a number of combats took place, in two of which large formations were engaged on each side.

In the course of the fighting eight German aeroplanes were brought down and six others were driven down out of control. Another enemy machine was shot down by our fire from the ground.

Four of our machines are missing.

JULY 21st, 8.57 p.m.—Four German aerodromes were successfully bombed yesterday by our aeroplanes, and bombs were also dropped on an important enemy railway junction, causing a large explosion.

There was much fighting in the evening. Three hostile machines were brought down and six others were driven down out of control.



Four of our aeroplanes are missing.

JULY 22nd, 9.5 p.m.—Yesterday, thick haze interfered with activity in the air until the evening, when many fights took place. Two German aeroplanes were brought down by our machines, and four others were driven down out of control. In addition, one German observation balloon was brought down in flames.

One of our aeroplanes is missing.

JULY 23rd, 9.37 p.m.—Much successful work was accomplished by our aeroplanes in co-operation with our artillery. Over 3 tons of bombs were dropped by us on the enemy's aerodromes, ammunition dumps, and railway sidings, and good results were observed.

Nine German machines were brought down in combat, including one brought down in the sea when endeavouring to return from England, and four other enemy aeroplanes were brought down out of control. In addition, one enemy machine was shot

down out of control by our anti-aircraft guns, and one hostile observation balloon was brought down in flames.

Nine of our aeroplanes are missing.

War Office Communiqués.

July 19th.—The G.O.C. the British Forces in Macedonia reports:—

There is no change in the situation.

Our aeroplanes have bombed Marinopolje and Vetrina (Upper Struma Valley), Savjak (south of Demir Hissar), and Angista station.

Near Angista a hostile machine was brought down in flames.

July 23rd.—The G.O.C. British Forces in Macedonia reports: On the same day our aeroplanes bombed Demir-Hissar and the neighbouring village of Puljovo (Struma front).

Home Command Communiqués.

July 22nd.—11 a.m.—A squadron of enemy aeroplanes variously reported at from 15 to 21 in number, approached Felixstowe and Harwich at 8 a.m. this morning.

Some bombs were dropped, but the heavy fire from the anti-aircraft defences caused the enemy formation to split up, part returning overseas, and part proceeding south down the Essex coast.

The latter party were heavily engaged by gunfire all down the Essex coast, and finally proceeded homeward without dropping any more bombs.

The raiders were pursued out to sea and heavily engaged by our own aeroplanes, but visibility was low, and difficulties of observation very great.

Reports of casualties from Felixstowe and Harwich so far are as follows:—

Killed 8. Injured 25.

6.30 p.m.—Since the issue of this morning's communiqué three more deaths and one further case of injury have been reported. The total casualties thus amount to:—

Killed 11. Injured 26.

Only insignificant damage to property was caused.

A patrol of the Royal Flying Corps encountered some of the hostile machines returning to Belgium, and succeeded in bringing down one of the raiding aeroplanes, which fell into the sea not far from the coast.

The Casualty List.

Reported July 18th.

Wounded.—Alston, Sec. Lt. C. R., R.F.C.
Dudbridge, Sec. Lt. M., R.F.C.
Missing.—Battersby, Lt. P. W., Yeo. and R.F.C.
Crafter, Lt., M.C., Lond. R. and R.F.C.
MacGown, Lt. J. C., Yeo. and R.F.C.
Died.—R.F.C.—Hutchison, 44754 2nd Cl. Air Mech. C. J. (Belgrave Road, Slough).
Australian Force.—Died.—Wakely, 1046 A. W. C.

PERSONAL NOTICES.

Deaths.

CAYFORD.—Sec. Lt. George Everett Cayford, R.F.C., accidentally killed whilst flying on July 16th, was the only son of Mr. and Mrs. E. Geo. Cayford, of The Mall, Wanstead. He was educated at Bancrofts Schools, Wanstead, and was apprenticed to Messrs. Broom and Wade, Ltd., Admiralty engineers, etc., of High Wycombe. Upon completing his indentures, he joined the Artist Rifles O.T.C., in February, 1916, and later received a commission in the R.F.C. He was very popular throughout the squadron to which he was attached, and greatly esteemed by numerous friends. He was 21 years of age.

JAKINS.—Sec. Lt. Walter Vosper Jakins, whose death in a flying accident was noted last week, had been a keen student of aviation for many years. When a boy at school he wrote an unusually well-informed book on flying, for private circulation, and kept in the closest touch with later developments thereafter, At the beginning of the war, being barely 18 years of age, he enlisted in the Sappers, and despite his youth quickly became an N.C.O. Last year he was transferred to a Cadet Battalion R.F.C., and duly qualified for a commission. His knowledge of flying led to his being made a flying instructor in a very short time, and in that capacity he did excellent work, and was, one gathers, Acting Flight Commander at the time of his death.

His senior officers, wherever he served, acknowledged his worth and ability, and he was universally popular with his juniors. Combining as he did a ready wit with intense keenness for the soldier's profession he was evidently marked for a distinguished career, had he survived. He was a typical example of the best class of British officer, of the kind who made the old British Army what it was, and his early death deprives the King's Service of a most promising member.

LITTLER.—Sec. Lt. Tom Littler, R.F.C., was the only child of Mr. and Mrs. John Littler, of Simla, Brixham. He was killed in an aerial action on July 3rd, aged 19. He was educated at Paignton College, and after some experience at the engineering works of the Great Western Railway Company, Swindon, joined the Artists Rifles O.T.C. in November, 1916, and transferred to the R.F.C. as a cadet last March. He obtained his commission on April 12th and his "wings" on May 18th. At the time of his death he had been three weeks at the front. Letters received point to his general popularity. "A stout-hearted and very gallant boy, always ready for his job," his squadron commander writes.

MACFARLANE.—Sec. Lt. Harold Embleton Macfarlane, R.F.C., who was killed in action on July 14th, was the son of Harold and Elizabeth Macfarlane, Baysgarth, Northwood. He was 18 years of age.

MIDDLETON.—Lieut. J. R. Middleton, R.F.C., eldest son of the late G. H. Middleton and Mrs. Middleton, 38, Inverleith Place, Edinburgh, and Mansfield, Strathmiglo, Fife, was born in Canada in 1888. He was educated in Natal and at Edinburgh Academy and University. In 1906 he joined the Canadian Pacific Railway Engineering Staff, where he was engaged as resident engineer on large bridge work in British Columbia when war broke out.

At once joining Strathcona's Horse, he served in France with that regiment, then as lieutenant in the 7th Cameron Highlanders. In 1916 he joined the Royal Flying Corps, and was with his squadron when heavily attacked on March 24th. His machine was forced down in the German lines, and as a wounded prisoner Mr. Middleton was sent to Mulheim Ruhr-hospital, where, a wire from the Red Cross, Geneva, says, he died on June 21st.

His younger brother, Lieut. A. S. Middleton, 1st Cameron Highlanders, died in Rouen in 1916, from wounds received in the battle of Loos.

PITTMAN.—Lt. Cecil Frederick Pittman, B.Sc.Eng., London, R.F.C., who was killed while flying in England on July 20th, was the elder son of Mr. Frederick John Pittman, of Beechcroft, Croydon. He was 26 years of age.

SMEETH. — Sec. Lt. William Sutton Smeeth, Royal Irish Rifles and R.F.C., who was accidentally killed on July 17th, was the eldest son of Mr. and Mrs. J. Watson Smeeth, The Sycamores, Ben Rhydding. He was 22 years of age.

STEVENS.—Sec. Lieut. John Michael (Jack) Stevens, R.F.C., died on July 14th while undergoing an operation at the New Zealand Stationary Hospital, France, owing to wounds received in action. He was the eldest son of the late J. M. Stevens, and Mrs. Stevens, of Sydney and Hazelbrook, N.S.W., and 8, Sellous Avenue, Harlesden, N.W. He was 17 years and 10 months of age. A solemn requiem mass will be sung at the Church of Our Lady at Willesden on the 27th inst., at 10 a.m.

TATHAM.—Sec. Lt. Ion Mordaunt Tatham, R.F.C., whose death in a flying accident with Capt. Van Goetham was announced last week, was the beloved third son of Mr. and Mrs. Charles Tatham, of Greytown, Natal. He was 19 years of age.

THOMSON. Sec. Lt. W. J. Thomson, R.F.C., who was killed on June 6th as the result of a flying accident in England, was the only son of W. B. Thomson, of Wynberg, Cape Town, the old Blackheath and International three-quarter of the nineties. He joined the London Rifle Brigade at 17 years of age, and after two years' training, as he was not sent abroad, he transferred to the R.F.C., and had only been flying for one month when he was killed. He was a keen athlete, and a member of the Bedford Modern School Fifteen, and was regarded as having the making of a good pilot.

TOPHAM.—Sec. Lieut. Michael Topham, R.F.C. (reported missing on April 13th, now officially believed killed on that date), was scholar of Downing College, Cambridge. He was 21 years of age, and eldest son of Mr. F. D. Topham, of Tonbridge, formerly of the M.S.M. Railway, India. He entered the Service in August, 1916, and had his "wings" in February of this year.

YOUNG.—Sec. Lt. John Edward Rostron Young, R.F.C., whose death was announced last week, joined the Artists Rifles in June 1916, and received his commission in the R.F.C. last February. His major stated that he had absolutely the heart of a lion, and was a very good pilot, that he could not speak too highly of the lieutenant's magnificent behaviour, and that he was proud to think he was in his command. Mr. Young was the fourth son of Mr. William S. Young, of 76, Mitcham Lane, Streatham, and of the late Mrs. Young, and grandson of the late Mr. J. S. Young, of Abbot Hall, Kents Bank, North Lancashire, and nephew of the late Lt.-Col. R. R. Young, 2nd Black Watch, and of Major T. S. Young, retired, I.A., and late 10th Suffolk Regt. He was educated at Streatham Grammar School, and before joining was with the British Bank of Northern Commerce.

Engagements.

DICKINSON—WAUCHOPE.—A marriage has been arranged, and will take place as soon as leave permits, between Capt. C. J. Dickinson, R.F.C., elder son of Mr. and Mrs. W. R. Dickinson, of Gayles, West Wickham, Kent, and Janet Caroline Sutherland, daughter of Maj. C. J. Wauchope, Argyll and Sutherland Highlanders, and Mrs. Wauchope.

FAULKNER—WALTON.—An engagement is announced between Lt. A. G. C. Wallis Faulkner, R.F.C., only son of Arundell C. Faulkner, of Winnipeg, Canada, and grandson of the late Colonel H. D. Faulkner, 2nd Madras Infantry, and Mrs. Faulkner, 6, Netherton Grove, Chelsea, and Morna Grace, younger daughter of the late Sir John Lawson Walton, K.C., M.P., Attorney-General, and Lady Lawson Walton, of Coombe Hill, Butler's Cross, Bucks.

LANGLEY—LODGE.—The marriage between Miss Lorna Lodge and Mr. Robert Langley, R.F.C., will take place at St. George's, Edgbaston, at 11.45 on Saturday, July 28th. There will be no reception, but all friends will be welcome at the church.

SMITH—BIRKETT.—A marriage has been arranged, and will shortly take place, between the Hon. Constantine Smith, R.F.C., younger son of Lord and Lady Colwyn, Colwyn Bay, and Marjorie Methwold, third daughter of Mr. and Mrs. Arthur Birkett, 22, Warwick Gardens, Kensington.

Marriages.

BALLARD—HILL.—At Holborn, by licence, on July 7th, Lieut. Maurice Ballard, R.F.C., only son of Mr. and Mrs. William Ballard, of Rorton, Herts, was married to Beatrice Gunton, the only daughter of Mr. and Mrs. Arthur Hill, of Stapleton Road, Balham, London, S.W.

GRIFFITH—BAILEY.—On July 11th, at the Church of the Annunciation, Bryanston Square, W., Lieut. Alfred Thomas Griffith, R.F.C., youngest son of John Griffith, of Hampden Park, Eastbourne, was married to Edith Marie, only daughter of Mr. and Mrs. John Bailey, of Gerrards Cross, Bucks, by the Rev. Bernard Shaw.

Birth.

DISNEY.—On July 9th, at Heronsgate, Herts, Kathleen, wife of Capt. H. A. P. Disney, 1st Cambridgeshire Regt. and R.F.C., of a son.

The promotion of Brigadier-General Brancker, Deputy Director General of Military Aeronautics, to be temporary Major-General, will afford keen satisfaction to those who recognise the excellent work he has done in effecting such a remarkable increase in both the size and efficiency of the R.F.C. simultaneously. Despite all sorts of difficulties and hindrances, and despite the admitted shortage of machines and engines, the training of the R.F.C. at home has increased in intensity to an astonishing extent, with the result that the young pilot with three months' experience now knows more than one with twelve months' flying to his credit knew a year ago. At the same time the number of pilots has multiplied many times over.

Concurrently, the supply of aeroplanes and engines has been pushed forward, and great progress has been made in spite of

the technical errors of the past—and present. General Brancker's personal experience as a pilot, his mechanical knowledge as a gunner officer, and his excellent choice of men—as exemplified by his appointments to home training and home defence commands, and to staff jobs—have been largely responsible for the great improvements which have taken place of late.

Because of these improvements, General Trenchaard's very able work in France has been made possible, and one hopes to see such action taken by the Air Board as will bring to full fruition the magnificent preliminary efforts in aerial war of the R.F.C. under these distinguished officers.

* * *

The appointment of Colonel E. M. Maitland, Essex Regt. (and Wing Capt., R.N.A.S.), to be a Companion of the Distinguished Service Order, will be heartily welcomed by those who have served with him in the Army. Although an aeroplane pilot, Captain Maitland, as he then was, recognised the potential value of airships to the Services and devoted himself to their development.

Both as an organiser and as an experimenter he has done work of immense value to both Services, for besides his airship work he was one of the chief instruments in bringing the kite-balloon into the Navy and Army alike. He formed, equipped, and trained the first K.B. sections—with the able assistance of Squadron-Commander Harry DelaCombe, R.N.—and many of those sections were taken over bodily by the R.F.C., despite the fact that K.Bs. had been thoroughly condemned and contemned by R.F.C. authorities only a little while before.

He was the first person in the world to leave an airship by parachute, and he has done much to develop the parachutes which are now used so successfully, and with so much effect as life-savers, by our airship and kite-balloon officers. Doubtless in time it will be thought worth while to develop parachutes also for aeroplanes, and when that time comes Colonel Maitland's experience will be of enhanced value.

The airships of to-day owe much of their success to Colonel Maitland, and in his present post he will certainly prevent many mistakes which would otherwise occur. There is a certain humour in the fact that, despite the handing-over of all lighter-than-air craft to the Navy, the success of our airships and balloons should be so largely due to soldiers like Colonel Maitland and the late Colonel Waterlow.

The relatives of Capt. Alex. Jennings, R.F.A., attached R.F.C., and of Lt. J. H. Muir, R.F.C., will be glad to receive any information concerning the fate of these officers, who were both reported missing on April 7th. Any information respecting either officer should be addressed to Mr. W. I. Jennings, Kennington Hall, Ashford, Kent.

FRANCE.

Official Communiqués.

July 18th.—Army of the Orient.—British aviators bombarded the station of Angista (Struma front).

July 20th.—Army of the Orient.—British aviators dropped bombs on the enemy depots at Petric (Bulgaria, Strumnitza Valley), causing fires. There were patrol encounters in the Vardar sector. The enemy artillery was active in the region of Monastir.

July 21st.—Between July 11th and 20th five enemy aeroplanes were brought down by our pilots, and in addition 11 hostile machines were driven down out of control in their own lines.

Army of the Orient.—British aviators, continuing a series of successful bombardments, caused fires in enemy stores and depots at Porna and Dedeli (north of Lake Doiran). There were patrol encounters and artillery activity in the region of the Vardar.

British aviators have bombarded the motor-car park at Demir-hissar (Struma front). During the day's air fights two enemy machines were brought down.

GERMANY.

Official Communiqués.

July 17th.—In addition to five aeroplanes, four enemy captive balloons were brought down by our aviators.

The following communiqué has been issued by the Chief of the Naval Staff in Berlin:—

July 17th.—During the forenoon on July 14th our naval seaplanes near the Hoofden Bank (off the Scheldt estuary) attacked a number of merchant vessels escorted by destroyers.

It was definitely observed that two destroyers were struck by two direct bomb hits each. One lighter was also struck.

July 23rd.—Our captive balloons, which are indispensable for directing artillery fighting, were, along the whole front, the object of futile enemy long-range fire. East of Ypres, they were also made the object of a combined attack by several aerial squadrons. Our battle aviators and anti-aircraft guns rendered these aerial attacks abortive. The captive balloons were undamaged. Eight enemy aeroplanes were shot down.

One of our aerial squadrons yesterday morning dropped bombs on Harwich on the east coast of England, with visibly good effect. The aeroplanes returned complete in number.

[This does not agree with the Home Command communiqué of July 22nd.—Ed.]

RUSSIA.

A message from Petrograd dated July 22nd states that soldiers in the trenches last Monday, prior to the Petrograd rioting, received bulletins from German aeroplanes stating:—

"Members of the Russian Provisional Government have been arrested. There has been rioting in the city. No use your fighting."

ITALY.

Official Communiqués.

July 17th.—Three Austrian machines were brought down by Lieut. Ruffo (his 10th victory), Sgt. Rizzotti (3rd victory), and Sgt. Allassio. Successful raids were made on Pola and Durazzo.

July 18th.—Aerial activity was considerable along the whole front. Two enemy machines were brought down by our aviators; one fell east of Mt. S. Daniele (Carso), and the other at Lom (south of Tolmino). One of our aeroplanes was obliged to land within our own lines.

July 19th.—The aerial activity was intense along the whole of the front. One enemy machine was brought down in an air engagement, and fell near Asiago.

July 21st.—On the Julian front one of our gallant aviators attacked a squadron of five enemy machines above Oppacchiasella (Carso), bringing down two, one of which fell in flames in our lines.

July 23rd.—Last night, notwithstanding difficult atmospheric conditions and the enemy's defence, our aeroplanes effectively bombed enemy batteries on Mt. Hermada (Southern Carso) and the railway works on the Opcina-Gabrovica line (near Trieste).

* * *

It was reported from Rome on July 19th that, in retaliation for the air raids by Austrians on Avlona, an Italian squadron of 21 aeroplanes, on the 16th bombarded enemy positions in Albania, while 18 seaplanes dropped two tons of high explosives over Durazzo, wrecking hangars, quays, and other defensive works. Three large machines shelled the camp at Berat, killing many of the troops and destroying stores and war material. All the machines returned safely.

* * *

It is reported from Milan that on July 19th the Aviation Mission of the American Government visited large aviation camps and works. Many of Italy's picked aviators gave a display of their skill. The American Chamber of Commerce entertained the distinguished visitors to lunch, and among the more noted people present were Major Bolling, Signor Caproni, the famous designer, and his brother, Dr. Caproni, with the popular American Consul, Mr. John Grout.

* * *

An "Authority" tells me that by the end of the war, even if this should occur prematurely, the air maps to India will be ready. Mr. Holt Thomas' lecture has made a most useful mark here, commented by the more intelligent papers.

* * *

The death of Colonel Piazza at the early age of 46, from illness contracted at the front, where he was in command of a regiment of Field Artillery, means a loss not easily summed up in words. The first, with Gavotti, Moizo, and that small elect company, to fly in war conditions, he leaves a vast work of organisation and invention bearing and to bear fruit.—T. S. H.

HOLLAND.

As a result of communications received from the Netherlands Government a further inquiry has been held into the dropping of bombs on Zierikzee, Schouven Island, last April. Fragments of the bombs dropped were produced, and after careful consideration the British Government have accepted the view that the bombs were dropped by a British airman under the bona-fide impression that he was over German-occupied territory.

His Majesty's Government have expressed their profound regret at the deplorable mistake, have assured the Netherlands Government that every possible precaution always has been and will continue to be taken to prevent such occurrences, and have expressed their willingness to pay compensation for the damage.

* * *

It was reported from Rotterdam on July 23rd that the Dutch steamship "Gelderland" was stopped this morning by a German seaplane under the eyes of the Hook of Holland coastguard. The Germans put an officer on board and took the ship to Zeebrugge.

U.S.A.

A message from New York states that the Senate also adopted on July 21st the House Bill appropriating £128,000,000 for aviation. The measure now goes to the President for signature when it will become operative. Details as to how the money will be spent have not been officially announced, but the Bill is drawn with the object of providing sufficient money for 22,000 aeroplanes and 100,000 men.

* * *

What the American aeronautical press calls a "recruiting station" for the Royal Flying Corps, has been opened at 435 Fifth Avenue, New York, under the command of Captain G. H. Bonnell, R.F.A. and R.F.C. Apparently Captain Bonnell is selecting British and Canadian public school men for appointments as cadets to be trained at Toronto.

AIRCRAFT IN THE HOUSE.

On July 17th, **Mr. Macpherson,** answering **Mr. Billing,** said the enemy aircraft on July 7th did not return from this country "unchallenged and unchecked." Details of the number of hostile machines which were brought down had already been announced. No military inquiry had been held into the circumstances of the raid, but, as was always the case, the preparations to meet it and the action taken had been carefully investigated with a view to improving the defence arrangements.

Mr. Hogge asked whether the machines brought down in the North Sea were part of the fleet which reached London? **Mr. Macpherson:** I must have notice of that.

Mr. Pemberton-Billing asked how many British pilots were killed or injured and how many British machines were smashed either by the enemy, or by forced landings, or otherwise during the air raid on July 7th.

Mr. Macpherson: Two pilots were killed in action. One pilot was wounded; one observer died of wounds. Two aeroplanes were destroyed by the enemy. Two aeroplanes crashed from other causes.

On July 18th **Dr. Macnamara,** replying to **Sir H. Dalziel,** who asked whether members of the Royal Naval Air Service were allowed to go up and attack enemy aeroplanes whilst flying over land or only over the sea, said: The Royal Naval Air Service work in the closest co-operation with the Royal Flying Corps in regard to home defence, and invariably attack enemy aircraft whenever and wherever seen.

Mr. Macpherson, in answer to **Sir H. Dalziel,** said the Royal Flying Corps were allowed to attack enemy aircraft over land or sea. **Colonel C. Lowther:** Is the hon. gentleman satisfied that sufficient cohesion exists between the naval and the land air services? **Mr. Macpherson:** Yes, I am.

[Mr. Macpherson might investigate further.—Ed.]

Mr. Macpherson (Ross and Cromarty, L.), asked by **Mr. Lynch** (Clare, W., Nat.) whether the aeroplanes that escorted Princess Mary on her journey to Southend-on-Sea were fighting aeroplanes, said: I am informed that H.R.H. the Princess Mary was not escorted by any aeroplanes of the Royal Flying Corps.

Mr. Lynch: Can the hon. gentleman account for the fact that all the London newspapers stated that she was? (Cries of "Oh!")

Major Baird (Rugby, U.), asked by **Major Kerr-Smiley** (Antrim, N., U.) whether a large number of aeroplanes had recently been out of action owing to the lack of spare parts, whether the manufacturers were instructed to supply a sufficient number of spare parts for every machine made, and who was responsible for deciding that the proportion of spare parts was requisite and for seeing that such a proportion was consistently maintained, said: The answer to the first and second parts of the question is in the affirmative. As regards the third part of the question, the proportion of spare parts per machine is decided by the two Services, who prepare the schedule referred to. Additional spares required for the further maintenance of machines beyond the original spares are ordered by the Supply Department on receipt of requisitions from the Services.

[Mr. Macpherson might do well to inquire why certain firms have been refused orders recently on the grounds that we have all the aeroplanes and parts which we require.—Ed.]

In answer to a further question, **Major Baird** added that everything was being done to remedy the present position.

On July 19th, **Major Baird,** answering **Sir H. Dalziel,** said: More aircraft could, no doubt, be used if they could be produced. The fullest use is being made of manufacturing facilities, and increased orders have been placed with those firms which are in a position to execute them.

[Then why have orders recently been refused to firms which can make aeroplanes?—Ed.]

Mr. Watt (Glasgow, College, L.): Is it not the case that some aeroplane factories have been closed down for want of orders? **Major Baird:** It is not possible to judge the question on those lines. There are two things which have to be balanced—aeroplanes and engines; and it often happens that some shop has to go short because of some parts from others not coming in time.

[When is the Government Enquiry into Engine Supplies going to take place?—Ed.]

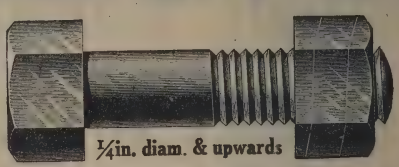
American Wood.

Sir H. Dalziel asked the Minister of Munitions whether any complaints have been received from aeroplane manufacturers concerning the quality of recent Government purchases in Seattle, United States of America, of silver spruce used in the construction of aeroplanes; and whether he is aware that there were no complaints of this kind when purchases were made through private traders? **Sir W. Evans:** No, Sir. The timber which is now being supplied to contractors is the best available.

Aircraft Engines (Output).

Mr. Peto asked the Minister of Munitions whether he is satisfied that no increase of output of aircraft engines would be possible if the fundamental principle of rivalry in quality and quantity of the finished product were applied wherever companies could be equipped to turn out the completed engine; and, if so, whether he will take steps to apply this principle at once? **Sir W. Evans:** The principle of rivalry is adopted in respect to design only. Once a design has been adopted, quality is adequately ensured by the present method of inspection. The manufacture of the same engine by various firms would not necessarily increase the output, and in the case of most engines the total possible output would be diminished, as compared with concentration on one firm, especially where it involved providing special facilities, organisation and tools.

Mr. Billing: Are not the reasons for delaying the output of engines because approved designs are altered by the official experts? **Sir W. Evans:** No; I do not agree.



Mr. Peto asked the Minister of Munitions whether, in the placing of orders for the construction of aircraft engines, orders have been divided into component parts on account of patent rights held by companies for the construction of some essential parts; and whether his Department will inquire whether the output could be accelerated if in any case where orders for parts only are at present placed with any company orders were placed for complete engines? **Sir W. Evans:** The placing of orders for parts of aircraft engines is arranged with a view to expedition in delivery, and the existence of patent rights is not taken into consideration in the placing of such orders. Whether orders are placed for complete engines or for parts depends entirely on the existing or potential capabilities of the plant of the manufacturing firm.

Mr. Billing: Would the hon. gentleman consider the advisability of cancelling all those orders for parts which have been given for engines which themselves are already cancelled? **Sir W. Evans:** I do not think my hon. friend can point to any such instance; if he can, I shall be obliged if he will let me know.

Mr. Billing: I shall do so.

Mr. Peto asked the Minister of Munitions whether all patent rights over the manufacture of aircraft engines or any other essentials of war have been without restriction placed at the service of the Government; and, if not, whether he will see that immediate steps are taken to place the Government in complete and unfettered control of all these rights for the prosecution of the war? **Sir W. Evans:** The Government has full powers over all patent rights under Section 29 of the Patents and Designs Act, 1907, and full power under Regulation 8/cc of the Defence of

the Realm Regulations to enforce the disclosure of secret processes and designs.

Mr. Peto: Is not the action of the Government, in fact, limited in placing orders for parts which are covered by any patent to the firm which holds those patents? **Sir W. Evans**: No; that is not so. The Government have full power to place any orders for any parts, whether or not they are covered by patents, wherever they think they can get the best production.

Losses (Official Reports).

Mr. Billing asked, in view of the fact that our official reports of air losses at the front refer only to machines that are missing, whether any official record is kept of the number of our machines lost by crashing or being shot down behind our own lines; and whether the figures are published? **Mr. Macpherson**: Yes, sir; official records are kept, but they are not published.

Mr. Billing: Will my hon. friend say whether papers will still be allowed to suggest by headlines that there has been a considerable success owing to only a portion of our losses being published? **Mr. Macpherson**: I am not responsible for what appears in the papers. They are, like human beings, liable to be wrong. **Mr. Billing**: Can my hon. friend edit the Commander-in-Chief's report, which suggests this to the papers?

Damaged Machines.

On July 20th **Mr. Billing** asked the Under Secretary of State for War whether it is the practice in the Royal Flying Corps, when a machine is wrecked or badly damaged, immediately to destroy by fire those parts which are combustible and to bury non-combustible parts; and, in view of the present shortage of metal, if he will see that this procedure is discontinued? **Mr. Macpherson**: No, sir; this is not the practice. **Mr. Billing**: Surely my hon. friend is aware that this has been done repeatedly and is being done, and under those circumstances will he issue an order to see that it is restrained? **Mr. Macpherson**: I cannot add anything to the very definite answer I have given, in which I said it was not being done.

Dismissed Pilots.

Mr. Billing asked the Under Secretary of State for War whether, in view of our shortage of pilots for the defence of London, he will see his way clear to recall all pilots who have been dismissed from the Royal Flying Corps, or are in process of being dismissed, or who have been or are being called upon to resign their commissions from the same on account of their refusing to fly the R.E.8 machine or criticising other aeroplanes of official design and provide them with a suitable fighting machine, and arrange that they shall be formed into a special squadron for the defence of London? **Mr. Macpherson**: The answer is in the negative.

Mr. Billing: May I ask whether it is not the fact that there are hundreds of pilots, first-class, skilled pilots, who for social and service reasons have been dismissed or requested to send in their resignations to the Flying Corps, and will these men be put to some useful purpose in view of the shortage of pilots? **Mr. Macpherson**: My hon. friend's supplementary question has no relation to the question on the paper. I have already denied that any man has been dismissed from the Air Services on account of social reasons. The question my hon. friend asks me here is whether the authorities are prepared to take back to the Flying Corps men that he himself states refused to obey orders.

Mr. Billing: Is the hon. Member aware that many pilots who refused to fly in the air raid are skilled competent pilots, and only refused to fly because they did not believe the machines were safe? Will they be given an opportunity to try something else?

On July 23rd **Major Baird**, replying to **Mr. Outhwaite** (Hanley, L.), said: The Air Board exercises control over the construction of aircraft in that it is responsible for design. Contracts, however, for supply are placed by the Ministry of Munitions. Sir William Weir, a member of the Air Board, is managing director of G. and J. Weir (Limited), who are contractors for aeronautical supplies. He is not personally a contractor. Mr. Martin, another member, is managing director of the Daimler Company and Birmingham Small Arms Company, both of which are contractors for aeronautical supplies. He is not personally a contractor.

Mr. Outhwaite asked whether it was not a dangerous precedent that Government contractors or designers should be in a position to determine which of their rivals should be allowed to design or contract. **Major Baird** said these two gentlemen had given their services at great personal sacrifice, and had rendered incalculable services to the Air Board. They drew no salary from the Government.

[It might be interesting to find out whether any officers of either Service, holding posts under the Air Board, are interested financially in any firms now making aeroplanes or engines, or parts of aeroplanes, and when, if such interests exist, they were acquired. Also it might be well to know whether any such officers were concerned in the establishment of new firms in the Aircraft Industry, and whether any officers are concerned in inventions taken up by commercial firms.—Ed.]

Mr. Macpherson: I hope the House will allow me to make a personal explanation. I was asked the other day whether any

aeroplanes escorted H.R.H. Princess Mary to Southend, the imputation being that those machines were withdrawn from the defence of London. I then replied that no aeroplanes of the Royal Flying Corps escorted her Royal Highness. This answer, I regret to say, was incorrect, but it was given after the usual reference to the Training Brigade of the Royal Flying Corps and to the Home Defence Group. Neither of these authorities was, I understand, able to find at the moment any foundation for the assertion. From further investigation it appears that on the occasion of this visit the hon. secretary of the Royal Naval Hospital had approached the commander of the depot squadron in the neighbourhood, and asked him for a guard of honour. The Squadron Commander replied that if he had any machines flying on that day in the ordinary course of training he would raise no objection to their flying along the railway. The hon. secretary of the Royal Naval Hospital wrote to Sir Edward Wallington to this effect, and Sir Edward in reply wrote:—"I beg to thank you for your letter of the 7th inst. informing me that Major Moore has kindly offered to escort the Royal train on Wednesday next into Southend. I hope that nothing will be done in any way to interfere with the services of the Royal Corps, as they may have more important places to defend. I have spoken to Princess Mary, and her Royal Highness quite concurs in this." On the day in question, however, five training machines were practising formation flying, which is part of the ordinary course of training, and this flight flew eight miles up the railway and back to Southend. These were ordinary training machines, and each was manned by an instructor and pupil. They were not armed, and would not, in any circumstances, have been used for fighting.

This action was taken by the Squadron Commander without reference to any superior authority, and he has stated that since the flight was an ordinary and proper part of the training for which he was responsible he did not consider any reference necessary. Consequently, Headquarters here, upon whom I relied for my information, were not apprised of the fact. I have taken the first opportunity of stating all the circumstances and all the facts to the House, and I would personally express my regret that I had been the means of conveying to it information on this subject which was incorrect.

[Mr. Macpherson is to be congratulated on his explanation, which is an example of his invariably courteous methods. The incident with which he dealt is one which should never have been made the subject of questions, either in the House or out.—Ed.]

THE AIRCRAFT WORKERS' SPORTS.

On Saturday, July 21st, a sports meeting was held at the Stamford Bridge football ground in aid of the Y.M.C.A. Fund for Disabled Sailors' and Soldiers' Hostels and Trade Colonies. The competitions were confined entirely to aircraft workers, and the function is therefore of considerable interest to the aircraft industry.

There were no less than 30 events, with nearly 120 heats, and it is difficult to say which sex acquitted itself with the greater credit. Some of the ladies took their racing very seriously, and came equipped with most elaborate costumes especially constructed for the occasion. Others seemed to regard the affair more in the nature of a joke, and seemed quite content to run impeded by the latest creation.

The events and their results were as follows:—

100 Yards Flat Race (Boys).—1, A. Claxton (Napier), 11.35 sec.; 2, G. Parsons (Napier); 3, A. Williams (Grahame-White).

60 Yards Flat Race (Ladies).—Cellon and "Flight" prizes.—1, Miss White (Darracq); 2, Miss G. Phelan (Gwynne's); 3, Miss A. Peckham (Aircraft Co.).

High Jump.—Novellon Cup.—1, R. E. Smith (Napier), 5 ft. 2 in.; 2, E. Dixon (Hooper's); 3, M. Anderson (Darracq).

Half-mile Boys' Relay Race.—1, Napier team; 2, Whitehead team; 3, Darracq team.

220 Yards Flat.—Whitehead Cup.—1, J. Fowell (Darracq), 22 sec.; 2, W. Clennell (Napier); 3, T. Thomson (Napier).

Pillow Fight.—1, A. Powell (Caudron); 2, J. London (Whitehead); 3, S. Painter (Caudron).

Cigarette Race.—1, Miss Baker and Mr. Jimson; 2, Miss Stone and Mr. Mead; 3, Miss Freeman and Mr. Whitebarn.

2 Miles Walk.—Whitehead Cup.—1, J. Theobald (Green Engine), 15 min. 54¾ sec.; 2, H. Stevenson (Napier); 3, W. Watts (Grahame-White).

Tug-of-War.—Aircraft Mfg. Co.'s Trophy and Medals.—Sopwith team beat Handley Page team, 2—0.

100 Yards Flat.—Aircraft Supplies Challenge Cup.—1, Hicks (Handley Page); 2, Howell (Darracq); 3, Clennell (Napier).

Sack Race (Ladies).—1, Miss Earl (Darracq); 2, Miss Tysall (Handley Page); 3, Miss Baker (Darracq).

880 Yards Flat.—Aircraft Mfg. Co.'s Cup.—1, J. Welsh (Napier), 2 min. 10 sec.; 2, R. Lewis (Napier); 3, C. Ward (Darracq).

Half-mile Cycle Race.—Auster Cup.—1, G. Turner (Integral), 1 min. 13 sec.; 2, Scheidegger (Napier); 3, Rowles (Darracq).

Delivery from Stock

Boat Race.—1, Highgate team; 2, Whitehead "A" team.
Sack Race (Men).—1, Jimson (Darracq); 2, Cleveley (Napier); 3, Kirke (Aircraft Mfg. Co.).
100 Yards Veterans' Race.—1, Hallett (Whitehead); 2, Boyten (Napier); 3, Phillip (Handley Page).
Three Miles Cycle Race.—Highgate Cup.—1, C. G. Turner (Handley Page), 10 min. 2 2/5 sec.; 2, C. Scheidegger (Napier); 3, S. Rowles (Darracq).
Long Jump.—Darracq Cup.—1, J. Hicks (Handley Page), 17 ft. 6¾ in.; 2, W. Clennell (Napier); 3, C. Russel (Gwynne's).
440 Yards Flat.—Whitehead Challenge Trophy.—1, Howell (Darracq); 2, J. Hicks (Handley Page); 3. Forster (Whitehead).
1 Mile Flat Race.—Triplex Challenge Trophy and AEROPLANE Cup.—1, Norman* (Gwynne's); 2, Lewis (Napier); 3, J. Welsh (Napier); 4, W. Standen (Napier). [*The question as to whether this competitor was legally entered is under discussion, and the award is awaiting the decision of the A.A.A.]
Obstacle Race.—Gwynne's Cup.—1, J. Holden (Grahame-White); 2, Hook (Handley Page); 3, Anderson (Darracq).
Relay Race (1 Mile).—R.F.C. Challenge Cup.—Dead-heat, Gwynne's team and Sopwith's team. It was decided by lot that Gwynne's, Ltd., should hold the cup for the first six months, and that Sopwith's should hold it for the second six months.

The Championship Trophy, subscribed by the ten firms who competed last year, was awarded to Napier, who scored 19 points. Handley Page, Ltd., and Darracq, Ltd., were placed second with 10 points each.

Some extraordinarily brawny work was put into the tug-of-war, the teams being well matched. The cycle race was also particularly good.

The function was concluded by the presentation of the prizes by Her Highness Princess Helena Victoria, and both the work of the competitors and of the organisers of the competition reflects considerable credit upon the Aircraft Industry. Many firms presented prizes and cups, including the following, the order and titles given being those laid down by the compilers of the official programme:—

Darracq Motors, Ltd.; Integral Propeller Co., Ltd.; D. Napier and Sons, Ltd.; Gwynne's, Ltd.; Handley Page, Ltd.; Grahame-White Aviation Co., Ltd.; Triplex Safety Glass Co.,; Maples, Ltd.; Austers, Ltd.; Goldsmiths and Silversmiths Co.; Whitehead Aircraft Co.; Aircraft Manufacturing Co.; Palmer Tyre, Ltd.; Aircraft Supplies, Ltd.; Highgate Aircraft Co.; Hooper and Co.; Improved Liquid Glues Co.; THE AEROPLANE AND GENERAL PUBLISHING CO., LTD.; "Flight"; Cellon, Ltd.; British Cellulose and Chemical Manufacturing Co.

For the convenience of Advertisers, replies can be received at the office of "THE AEROPLANE," 166, Piccadilly, W.

PATENTS.

PAGE & ROWLINGSON, Chartered Patent Agents (Consulting Engineer, Mr. S. E. Page, A.M.Inst.C.E.), 27, Chancery Lane, London, W.C. Tel. 332 Central.

Henry Skerrett, Chartered Patent Agent, 24, Temple Row, Birmingham.—Patents, trade marks, and designs.

SITUATIONS VACANT.

Mechanic to take charge of experimental trials. Experience of engine running and aeroplane erection essential. Reply stating experience and wages required. No one residing more than 10 miles from the N.W. London district or already on Government work need apply.—Write 243, Sell's Advertising Offices, Fleet Street, E.C.4.

Sheet Metal Workers for aeroplane work. Men on Government work or residing over 10 miles away need not apply. Good wages. Apply personally at 10 o'clock any day to the Aircraft Construction Co., Harley Aeroplane Works, Beckton Road, E. 'Phone: East 1300.

Draughtsmen required by aeronautical engineers, London, N.W., preferably with experience of aeroplane construction. No one living more than 10 miles away or engaged on Government work need apply.—Write giving age and salary required to 238, Sell's Advertising Offices, Fleet Street, E.C.4.

Storekeeper. Wanted immediately. Reliable and experienced man, ineligible, to take charge and supervise in and out going material in controlled works, Newcastle district. No one already engaged on Government work need apply.—Apply your nearest Employment Exchange, quoting No. A. 3409.

Wanted for aeroplane work, North of England, thoroughly competent and practical man, used to wing erection, able to take charge. No one on Government work need apply. Applications must be made through nearest Employment Exchange, mentioning this paper and Box No. 2003.

Draughtsman wanted at once for Government controlled establishment. If possible, with some experience of aeroplane design. No one on Government work need apply. Applicants to state age, experience, and salary required through nearest Employment Exchange, mentioning this paper and Box No. 1198.

Quantity Draughtsman or Clerk required immediately for Government controlled establishment, with knowledge of engineering drawings and practice. Must be over military age or exempt from service. No one on Government work need apply. Applications to be made through nearest Employment Exchange. State age, experience, and salary required, mentioning this paper and Box No. 1199.

Chief Storekeeper required for aviation works near London. Previous experience desirable. References required. No person resident more than 10 miles away or already on Government work need apply.—Reply, stating age, salary, and experience to Box No. 2000, THE AEROPLANE, 166, Piccadilly, W.1.

SITUATIONS WANTED.

Works Manager.—Engineer of education and good business ability, having 25 years' general practical experience, is open to immediate engagement. Used to production of aero engines and plane components. In last berth had control of 3,000 mixed hands on shell production, with full responsibility of everything in connection therewith, including tool-room and plant maintenance. Responsible, tactful, resourceful, reliable, and can handle large staffs with good all-round results.—Box No. 2006, THE AEROPLANE, 166, Piccadilly, W.1.

Responsible Position required by experienced sawmill foreman. First-class knowledge of woodworking machinery; an excellent jig and tool designer. Aircraft experience, also used to high-grade cabinet work. Strong disciplinarian and tactful. Willing to instruct available labour. London area preferred.—Reply Box No. 2005, THE AEROPLANE, 166, Piccadilly, W.1.

Energetic Engineer, now engaged as foreman over large fitting shop in leading aeroplane works, desires change. Thirteen years' tool-room and machine-shop practice with first-class companies. Capable organiser and can show results.—Box No. 2004, THE AEROPLANE, 166, Piccadilly, W.1.

Tool-room Foreman or works superintendent, aircraft works, desires re-engagement. Well up in aircraft requirements, stampings, jigs, tools, engines, etc.—Box No. 2007, THE AEROPLANE, 166, Piccadilly, W.1.

Mathematician and stress draughtsman, experienced in aeroplane calculations, requires suitable post.—Write Box No. 1190, THE AEROPLANE, 166, Piccaldilly, W.1.

FOR SALE.

Nibbling Machine for pattern cutting, etc. (by Burton, Griffiths & Co.), nearly new, cheap.—Cole, Playfair Road, Portsmouth.

For Sale, 4 sheets aluminium, 12 ft. by 4 ft.—Offers to Lacys, Engineers, Dewsbury.

Engineering Works near London to be sold as a going concern; at present engaged on machining work for the leading aircraft firms.—Particulars Box No. 2002, THE AEROPLANE, 166, Piccadilly, W.1.

For Sale, with the advantage of immediate possession, well-situated Aerodrome (leasehold, with option of acquiring the freehold) of over 100 acres, two-thirds of a mile long and one-third of a mile wide, with hangar and repair workshop, both fitted with electric light; also dynamo, aeroplanes, engines and parts.—Further particulars of Box 918, Reynell's, 44, Chancery Lane, W.C.2.

Walker's 150-h.p. size Fan Dynamometer for engine testing. Offer wanted. Also quantity of hose pipe.—"Aeroplane," 58, Compton Street, E.C.1.

New 40-h.p. Aero-engine fitted with propeller. A great bargain, £25; must be sold.—Box No. 1194, THE AEROPLANE, 166, Piccadilly, W.1.

Aeroplane Radiators.—The Gallay Radiator Company, Limited, stock Aeroplane Radiators. For the benefit of Constructors, can supply radiators for experimental purposes at a nominal cost. Advice given on suitable types for the various approved engines. Our drawing office is always at our clients' disposal.—198, Great Portland Street, London, W.1.

Allies' Aeroplane Brooch. Latest Novelty. Made in silver, with exquisite enamelling of Allies' colours. 3s. 6d. Allen, 142, Hall Road, Norwich.

MODELS.

Model Aeroplane. — Flies ¼-mile, circular flight, 3s. 3d. carriage paid. "I can thoroughly recommend your machines." Testimonial from Dr. E. Adams, Union Road, Sheffield. Thousands satisfied. Testimonials from all parts.—Dept. C, Bristol Model Aeroplane Depot, Eastville, Bristol.

WANTED.

Aeroplane cuttings or any kind of odd tim bought—prompt clearance.—M. W., c/o 4 Hackney Road, London, N.E.

Wanted, mahogany, teak, and walnut cutti from builders', railway, and aircraft works Box No. 2001, THE AEROPLANE, 166, Piccadi W.1.

Aeroplane metal work wanted at once. W ing, turning, etc. Highly skilled st machinery running.—Shephard, 528, Kin land Road, E.8.

Design and full working drawings requi immediately for a fast scouting biplane.— dress full particulars to the Ruffy, Arnel Baumann Aviation Co., Ltd., The Lon Aviation Ground, Acton, W.

ENGINEERING.

British School of Aeronautics. — Airc Engineering Course; Aero Design; Aero C struction; Aero Draughtsmanship; Mechan Engineering. — Pennington's, 254, Oxf Road, Manchester.

AIRCRAFT PARTS.

Tapes, Webs, Cords and Threads in all qu ties, suitable for Aircraft Work. Delivery f stock.—John MacLennan and Co., 30, N gate Street, London, E.C.1. (See Advert ment Page 271 and Buyers' Guide.)

Engineering Firm solicit inquiries machine work of all descriptions, such turning, drilling, milling and fitting; accu work to micrometer with first-class finish good deliveries guaranteed; repetition wor speciality.—Lankester Engineering Co., Eden Street, Kingston.

AUCTION.

Re KROLL & CO., Sheet Metal Workers Manufacturers of Aeroplane Parts, ham Place, Camden Town, N.W. order of R. Barlow Tyler, Esq., F.C the Controller appointed by the Board Trade.

Messrs. FULLER, HORSEY, SONS CASSELL are instructed to invite tenders the purchase, in One Lot, as a Going C cern, of the BUSINESS and ASSETS Messrs. KROLL & COMPANY, compri the modern

FIXED PLANT AND MACHINERY LOOSE TOOLS AND UTENSILS, THE STOCK, STORES, AND WORK PROGRESS,

together with the GOODWILL and BENEFICIAL INTEREST IN RUNN CONTRACTS.

The Purchaser, who must be a natural- British subject, will be required to com the Contracts in hand and to satisfy the B of Trade as to his ability to do so. He further be required to accept assignment the three Leases under which the Works held, and to indemnify the Controller in spect thereof. The BOOK DEBTS owin the firm may be acquired by him at a va tion to be made by two Chartered Account or their Umpire.

Tenders, which must be on the form tained in the Particulars, should be deliv under Seal marked "TENDERS for Asse Kroll & Co.," at the Offices of the Contro 1, Queen Victoria Street, E.C., by Tw noon, on

WEDNESDAY, AUGUST 8th, 1917.

The Works may be viewed by orders t obtained of the Auctioneers, and particu with Conditions of Sale, had of Me ROCHE, SON & NEALE, Solicitors Church Court, Old Jewry, E.C.2, of Me ANDREW W. BARR & CO., Chart Accountants, 1, Queen Victoria Street, E and of Messrs. FULLER, HORSEY & 133, High Holborn, W.C.1.

AUGUST 1, 1917. VOL. XIII. NO. 5.

Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Rolls House, Breams Buildings, E.C.4.

Subscription Rates, post free: Home, 3 months, 3s. 10d. 6 months, 7s. 7d.; 12 months, 15s. 2d. Abroad, 3 months, 4s. 4d.; 6 months, 8s. 8d.; 12 months, 17s. 4d.

ON SOME DIRECTIONS FOR REFORM (II).

An Official Example.

So far as I can gather, there is, under the Air Board, as under all Government Departments, a regular plague of forms and regulations and rules, which hold up output, and much reform is needed in this direction. For instance, a friend of mine who runs a smallish factory wanted some small tools the other day—we will say they were hack-saws, though they were not. He requisitioned for them in the proper official way, and after many days' delay he was told that there were none to be had at the moment in that size. Then he told an official person that there were some in a shop, whose address he gave, round the corner from his works, but he was afraid to buy them for fear of breaking regulations.

The official person said that they would be bought for him. After still further delay he was informed that they could not be had—the reason being, as he discovered on investigation, that the official order had been sent twice to the wrong address. Finally the order *was* sent to the right shop, and then he was told that the hack-saws had been bought by somebody else in the meantime. All this took a couple of weeks, and, for all the official system did to help, certain very important aircraft parts would have been held up during that period.

As a matter of fact, my friend had gone and bought the saws himself as soon as he had told the official person about them and had set the official machine in motion. Consequently the parts were actually delivered just before the official system had discovered that it was impossible to supply the small tools with which to finish the work.

But there you have a priceless example of the effect of an official attempt to run a system which tries to combine the offices of a metal merchant, a wholesale dealer, a commercial traveller, a manufacturer, a retail shopkeeper, and a consumer, all under one hat.

The Practical French Mind.

The French tried a somewhat similar system of Socialism-run-mad ever so early in the war, and the French manufacturers broke the system by simply sitting still, sticking strictly to the system, obeying every regulation absolutely to the letter, and never acting on their own initiative, with the result that output was hopelessly jammed, and the officials rushed round and besought the constructors to go ahead any way they pleased, so long as they gave them output. And so the system was forced to break itself. But it was more than a little rough on the active-service pilots while the system was in process of breaking.

It is just the same with machine tools. Over and over again an aeroplane or aero-engine maker wants machinery and knows where to get it, and yet he cannot have it because some Consequential Cuthbert in the Air Board or the Ministry of Munitions refuses to exert himself to make out the necessary documents, or is afraid to take the personal responsibility involved.

By the introduction of a properly elastic system, whereby the responsibility was put on the manufacturer himself instead of on a lot of inefficient officials, half the business of documents, and release notes, and forms, and permits, and inspections, and viewings, and so forth, could be abolished, and output would go up by leaps and bounds.

Timber.

Dr. Addison has informed us, with an air of pride, that our present programme of construction requires more spruce than the present annual output of the United States, and more mahogany than Honduras can supply—and Honduras is accustomed to supply the requirements of the world.

Perhaps, when Mr. Churchill has dealt faithfully with the engine question, he will then tackle the timber question. It may interest him to find out why and when timber importers who know their business from A to Z were prevented from buying timber of the right sort abroad and shipping it to this country, and what has been the effect of the official attempt at buying timber.

So far as one can gather, the chief result has been immense delay in buying and shipping timber, and a secondary result seems to have been to unload a lot of unwanted timber of the wrong sort on constructors, owing to the fact that they have been unable to go and select their planks from merchants' stocks in the way which has proved so satisfactory in the past. Apparently there has been a still further waste of time and labour and material through this cause.

Typical Science.

The ingenuous, or ingenious, working of the official mind appears in an instruction sent out not long ago to the effect that it is thought that too little attention is given to the inspection of rough timber. Apparently officialdom thinks that the procedure for testing rough timber "should be almost exactly the same as the procedure for testing sheet steel and bar—in other words, samples should be taken, and if there is any doubt as to the quality they should be sent to the laboratories for test." Furthermore officialdom says, "In many cases rough timber appears to receive no inspection whatever. In others a purely visual inspection alone."

The spectacle of an Inspection Officer solemnly hewing out a cubic inch or so from a log and submitting it to a laboratory test is one which should rejoice the heart of the N.P.L., even if it moved a practical timberman to tears—of helpless laughter. When one considers that it is practically impossible to find a perfect plank, let alone a perfect log, one is astonished at the state of mind of an official who proposes to accept or condemn rough timber on the strength of a sample and

test by the same procedure as "for testing sheet steel or bar."

Steel is at least fairly homogeneous, but in timber one cannot tell till one has sawed a plank into smaller pieces whether or not there are knots or other defects which make it unsuitable for use. Timber which looks rotten in the rough may produce magnificent spar lengths if one knows how to dodge the defective spots, and a plank which would not give a single spar may give a fine supply of chassis or fuselage or wing struts.

It might be worth while to cut the end six inches off an over-long spar length and see whether that particular piece of timber gave approximately the proper specific gravity and crushing strength ascribed to wood of that breed, but one might easily find in the same plank other pieces of wood which were far below standard, and condemn the whole log on the strength of it.

Visual inspection by an experienced timber handler is the only test of timber on which one can really rely, for the testing of sample pieces in the way suggested may result either in the acceptance of a bad plank, with dire results to the aeroplanes made from it, or the rejection of a perfectly good plank, with consequent waste of extremely good raw material.

Over-Inspection.

As I have said over and over again in this paper, the whole inspection system needs overhauling. There is far too much theory and not enough practical common sense about it. As Mr. Massac Buist said recently in a wholly excellent article in the "Morning Post," "The Inspection Department is quite praiseworthy in theory, in that it aims at inspecting every mortal thing on behalf of our own—or, apparently, any other nation's—Aircraft Services, stage by stage during production. In practice, alas! it is quite the most effective means of preventing output that has yet been devised. It is, besides, a means of increasing cost, and is also quite astonishingly inefficient in detail. . . . The fact is the Department is in as thoroughly bad odour among those who wish to use aircraft as it is among those who produce them."

There you have the A.I.D. system in a nutshell, though it is important to note that in the A.I.D., as in every other department under the Air Board, there are many excellent men who could and would do all the necessary work in half the time if only they could have a free hand.

Mr. Buist continues: "It is high time the Government caused investigation to be made by an impartial and strong man as to how output is held up by what may be called the ineffective machinations of the A.I.D., for by no means all that it passes is perfect. May the Fates forbid that another committee or board should be set up for this work. . . . We live in an age in which we dissipate energy wholesale through committees which are so dear to the political type of mind because they are right excellent and almost infallible means of throwing the public off a scent. Unfortunately we have to deal with the Hun in the air and elsewhere, therefore in the matter of aircraft we must have the biggest output and the least delay possible; which means we cannot afford any more boards or committees. All that is needed is to put some reasonable limits to the well-intentioned obstructive tactics of the A.I.D. and to prevent it overlapping the work of other departments."

The Work of the Press.

Mr. Buist deserves a vote of thanks from all concerned for the good of our Flying Services for having written such a wholesale condemnation of the present state of affairs, and the Editor of the "Morning Post" deserves to be included in that vote of thanks for having dared to publish the article. One only wishes that other papers had similar independence and similar courage. When one contrasts the strong constructive criticism of Mr. Buist, on this occasion, with the flatulent sycophancy and flag-wagging flapdoodle of the "Daily Mail's" article of a couple of weeks ago one realises more than ever that despite all his faults the good old hardened Tory is still the real backbone of this country and may be relied upon to do the right thing when the occasion demands.

Compare with Mr. Buist's demand for reform the "Mail's" cocksure statement that "If no troubles with labour interfere, if no shortage of material compromises our plans, 1918 should see the Allies dominating the German lines with their air fleets and bringing—in the only way possible—the ultimate victory."

The "Mail's" "Special Correspondent" tells us that much on the strength of "two hours in close and intimate talk with the organisers of supplies for our air fleet." The public, and presumably the editor of the "Mail," doubtless prefer to believe their two-hour "expert" rather than the men who have devoted the best years of their lives to trying to drum into this country the need for proper organisation and supply of aircraft.

The Real Troubles.

Labour troubles and shortage of material pure and simple are the least of the causes of shortage of aeroplanes. Labour troubles arise through what the men call "being messed about" by officialdom. Shortage of material arises through waste by officials, rejection of usable material, condemnation of partly manufactured components, and scrap produced by absurd or impossible official designs.

The A.I.D. is to blame for much of the waste of material and labour, and consequent labour troubles—for a man who knows that the work he is doing is appreciated and valuable is less likely to be discontented and to agitate than is the man who knows that all his efforts are being wasted in producing food for the scrap-heap. But the Design Departments are at least as much to blame, for thence emanate the absurd designs which produce the wastage, and it is those departments which adhere rigidly to their own notions and refuse to permit latitude in methods of production or alterations in detail design which would expedite deliveries and reduce wastage.

Propellers.

Take a very simple instance of waste of material and labour. Dr. Addison has been talking about our enormous consumption of mahogany—most of which is used in propeller-making. There is no need to consume such vast quantities. Reduced consumption means reduced price, and the present price of mahogany is sheer robbery of the national exchequer.

A friend of mine, a practical propeller-maker of many years' experience, writes:—"It is quite an easy matter to economise fully 80 per cent. of the timber, and to increase the output by 120 per cent., by abandoning the geared-down four-blader in favour of the direct-driven two-blader.

"A (two-blade) propeller made recently for the 150-h.p. Hispano-Suiza-Spad gave, in competition with the leading French and English propellers, the best climb and horizontal speed, and had a diameter of only 7 ft. 8 in., with a weight of only 17 lbs., and the amount of timber used (averaged over 100 propellers) was 26 superficial feet per propeller. The time required for shaping was less than 25 hours.

"This compares very favourably with any of the official designs. The R.A.F. four-blader propeller for the R.A.F.4a engine (of less power) to drawing T6296, for instance, requires over 120 superficial feet, and takes 75 hours for shaping.

"A better-designed four-blader for the same engine would require about 80 feet super of mahogany, but if the propeller speed was increased to — or — r.p.m. (which is still a safe propeller speed) a small two-blader requiring not more than 30 to 40 feet super of mahogany could be designed to give quite satisfactory results.

"Four-bladers are only used to any extent in this country. Originally a brain-wave of Professor Lanchester's, they have been duly copied by the R.A.F. experts, though they are neither efficient nor economical in the making. They have no advantage whatsoever. It is always possible to design a more efficient two-blader, considerably lighter and cheaper, and very often with a smaller diameter."

There you have a perfectly clear case of official waste of labour and material, all on account of a theory which was sound enough when we flew heavy, slow machines with low-powered engines. In these days of big powers it is very doubtful whether gearing propellers pays in any way, except, perhaps, in enormously large machines.

The propeller-maker continues further by saying in effect that the design of propellers on present principles, though adopted over the whole world, does not seem to give the best results that can be obtained; at any rate, his experiments of the last two years seem to indicate clearly that a slightly different principle of design gives better results.

RECOMMENDATIONS.

In order to economise material and labour, he recommends :—

"(1) Increase in propeller speed instead of gearing down.

"(2) Two-blader propellers only.

"(3) Alteration in principle of design.

"(4) A standard engine-boss fitting, with a bore of not more than 70 mm. for all propellers absorbing less than 350 h.p.

"(5) Scarf and half-lapped joints to be allowed, as in French propellers—the present concessions for joints in two-bladers are dangerous and do not save material.

"(6) Gluing up 'en bloc' to be allowed. It is already allowed to some firms."

He admits that it would be expecting too much of officialdom to ask for all these suggestions to be carried out at once, but it seems to him advisable to abandon at least a few of the most wasteful propeller designs as soon as possible. For instance, one may mention the R.A.F. propeller to drawing T.6296, the Curtiss propeller to drawing A.D.616, and the Sunbeam propeller to drawings A.D. 501m and A.D.675.

Now, if Sir William Weir or Lord Cowdray deigns to act upon these hints and makes inquiries on his own account, he will naturally be met by a mass of technical evidence from people who seem much more anxious to save their own faces than to save material or even the lives of pilots who are anxiously awaiting more and better aeroplanes. Nevertheless, there are facts clearly set forth, showing how timber and labour may be saved.

THE GERMAN WAY.

Germany, also, is short of timber, and consequently the propellers on recently captured German aeroplanes

(From an Official Photograph.)

THE QUEEN WITH THE R.F.C.—Her Majesty with General Trenchard, inspecting a fighting machine. The curious Venetian blind over the radiator is of interest, as is the rack under the wing, which would appear to add considerable head resistance.

are simply a mosaic of short bits of wood of all sorts beautifully glued together. Whence comes all the glue is not known, but apparently it is at least as plentiful in Germany as timber for propellers. It cannot all come from the "Korpsvervaltungsanstalt," because there are not enough toe and finger nails on the human body to account for it all. But, anyhow, there is the glue, and very fine work it does. It does not suggest that the German air "experts" have turned down their best sources of glue supplies merely because their best glue-maker has refused to divulge his secret method of manufacture. And despite their patchwork propellers, the German aeroplanes are able to hold their own as flying machines against ours. Also, has anybody seen a four-blader on a German machine?

Our Way as It Is and Might Be.

Meantime, we, despite our admitted shortage of timber, insist on only using the big pieces which will go from the end of one blade to the end of the other. And we throw away in making each propeller quite as much timber as would make another one on the German principle.

Thus we see that, if we gave up the wholly English custom of using four-bladers, we should save at least half our timber and half our labour. And if we built mosaic propellers as every other country does, we should produce equally as many propellers from the same amount of imported timber. We could produce these latter propellers with the labour saved on the four-bladers, so that we could reduce our imports by half, and double our output with precisely the same number hands as we employ at present.

A Warning.

Do any of my brilliant young technical friends dispute the fact? If they endeavour to convince Lord Cowdray or Sir William Weir to the contrary, let the Chiefs of the Air Board remember one very important fact. If any of their technical people—always excepting the officers of the Regular Army or of the Navy who were in the Flying Services before the war, and a minute percentage of men of independent means who are really doing their best to serve their country—were half as clever as they make themselves out to be, they would not be working at the Air Board on Service pay. They would be drawing anything between twice and ten times the pay in the employ of ordinary commercial firms. Probably neither Lord Cowdray nor Sir William Weir realise to what an extent the "air experts" which have been thrust upon them are merely the throw-outs of the Aircraft Industry and of the Motor Trade.

More Waste.

Yet another cause of wastage, apart from wrong methods of design and manufacture, is the system of inspection. In any propeller factory one sees stocks of propellers, some partly finished, some wholly finished, rejected for some trivial defect which does not in the least detract from their usability. These are ultimately sawed up and burnt, whereas by letting in a patch or a piece here or there the majority of them could be made fit for service.

Again, there are thousands of pounds' worth of propellers wasted through the type of machine for which they were designed being "washed out." In some cases contracts for propellers are allowed to run on, and propellers are actually made, long after the type has been deleted. Some of these propellers, at any rate, could be re-shaped and made suitable for use on other types of machines.

Yet again, at some Service aerodromes, directly a propeller is ever so slightly damaged, it is scrapped, and is cut up into walking-sticks or others of those ingenious souvenirs, the making of which has now almost assumed the dimensions of a national industry. But at other stations even badly damaged propellers are rebuilt in the aerodrome workshops, with the result that hundreds of pounds are saved and the work of training is accelerated because there is no waiting for new propellers from store.

There seems no reason why all propellers which are not utterly smashed should not be similarly rebuilt, either at group headquarters workshops, or by the original makers of the propellers. Much of the small pieces of propeller timber resulting from sawing up planks, and at present used merely as firewood, could be used up in this way. It does not seem unlikely that a shipload or so of mahogany could be saved in the course of a year by this means alone.

The Bar of Novelty.

One of the greatest hindrances to rapid production of anything needed by the Services—not aircraft alone—is the unwillingness of various established departments to accept new ideas, consequently one does not expect very prompt results from any suggestions hereinbefore made which may smack of novelty. The odds always are in favour of a new idea being condemned simply because it comes from outside. When anything new is submitted, it has to be passed and approved by the department concerned. That department is also charged with producing novel instruments of the same nature. Consequently before a new idea can be adopted, the inventor has to convince the department that his idea is better than theirs—which is absurd. Q.E.D.

A Naval View.

Some time ago I was discussing this same eternal question with a very old friend of mine in the Navy, now a senior officer of sufficient service to have had his once bright brain worn into the regulation groove, sealed pattern 1897 or thereabouts. His theory is that it is never worth while for a Service technical department to bother its head about suggestions or inventions or ideas from outside, because the Service man whose duty lies in that direction will come across the same idea sooner or later.

According to him, out of every 10,000 inventions submitted, perhaps 100 are worth reading twice. Out of that 100 perhaps 5 contain germs of sense which might be developed into something, but probably 4 of them and the other 95 are already in use or in process of development. The 1 remaining invention of the 10,000 may be really good, but the Department would come across it for itself in course of time, and so it is not worth while to waste the Department's time in wading through the 10,000 for the sake of 1 idea, which would come to light in any case in a year or two.

I reminded him of a few little things like Whitehead torpedoes, Sperry gyro compasses, Marconi wireless, and so forth, which came from right outside the Service, but he still held that the Service would have discovered them for itself, if left alone by interfering newspapers and politicians, and would have saved itself a lot of trouble in doing it. I did not dare to suggest anything about aeroplanes, because I know that he regards all aircraft as a beastly nuisance which cannot possibly be of any use to the Navy, though possibly they may be necessary to the mob of leather-necks (Naval term for soldiers) ashore, who have no fire-control tops of their own, and who cannot get their scouts round the enemy's flanks as the Navy can with fast destroyers, or under the enemy with submarines as the Navy can.

He laments that a few really promising Naval officers have ruined their careers in the Navy by perverting to flying. He holds that on board ship their

aeroplanes get in the way and spoil the decks—the fact that the ship is commissioned as a seaplane carrier does not affect the question, of course: which rather agrees with my own view that an aerodrome would be a charming place if it were not for a lot of noisy aero-engines interfering with conversation, and a lot of aerial acrobats distracting one's attention. Also, he has a supreme contempt for their fiddling little engines of a hundred or a couple of hundred h.p., never having been conveyed himself by less than some thousands of h.p.

He treats with scorn my humble suggestion that the stick-and-string Navy of fifty to a hundred years ago held precisely similar views about his oily engines, and clock-work torpedoes, and tin-sided ships, and silly guns that load at the wrong end: all of them accursed novelties which in their day were considered to make the Navy a profession unfitted for a gentleman.

Strange as it may seem in so new an arm, one finds the germs of similar conservatism creeping into the Flying Services, with the inevitable result of hampering new ideas. But the root cause of all this conservatism is that the new ideas come from outside and do not originate with the Department most concerned.

ON ENGINES AGAIN.

Take the question of engines again. If some new idea for an engine is started inside a Department, any quantity of material and labour and machinery can be found to develop it, no matter how freakish the design. If a Government Factory cannot tackle the job, some favoured commercial factory is found to take it up. Quite possibly an official from the Department concerned is told off to look after the job, and to superintend the experiments and output. Apparently it does not matter much whether the particular official has had any success in any other of his ventures. If he is in favour in the Department that seems to suffice. And if the whole thing is only another official failure, the firm is presumably paid handsomely for the work done, the shareholders get their dividends, and so it is nobody's affair to raise a row about the waste of man-power and material which might have been employed in turning out engines of use for war service.

But if a new design of proved value is submitted from outside, things are very different. No matter how the proprietors of the design set to work, no matter from what angle they attack officialdom, whether through ordinary official channels, through the Board of Inventions and Research, through political people, or any other way, eventually they bump into the same department, where they are merely boomed off by understrappers, apparently youngsters who are there for the purpose, and who are unable to discuss the technical points of the engine which they are told to reject.

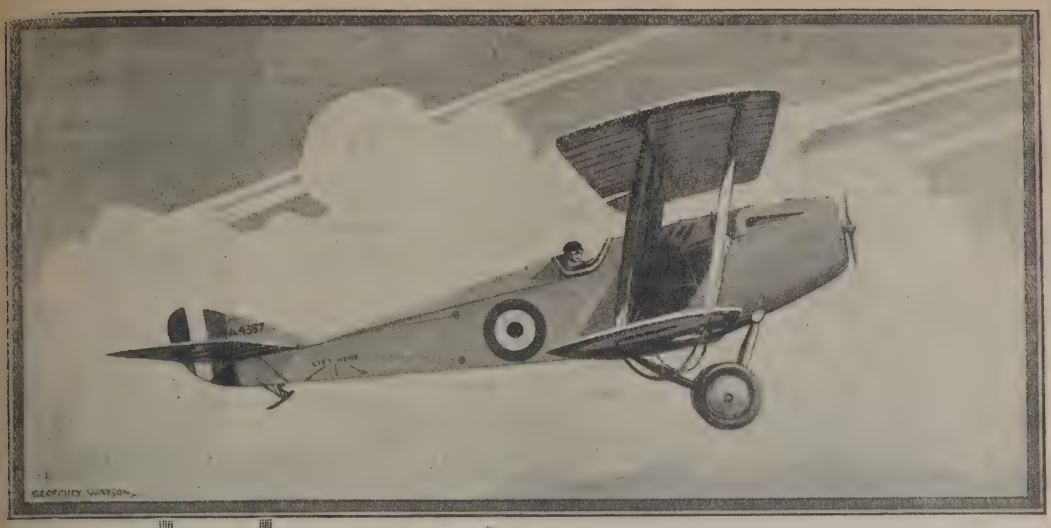
Consequently one finds two results. Firstly, really promising engines, which need perhaps a little more experimental work, are not developed because they cannot obtain official approval. And, secondly, engines which are really useless freaks are not properly squashed, and so people go on wasting time and money on them.

A Case in Point.

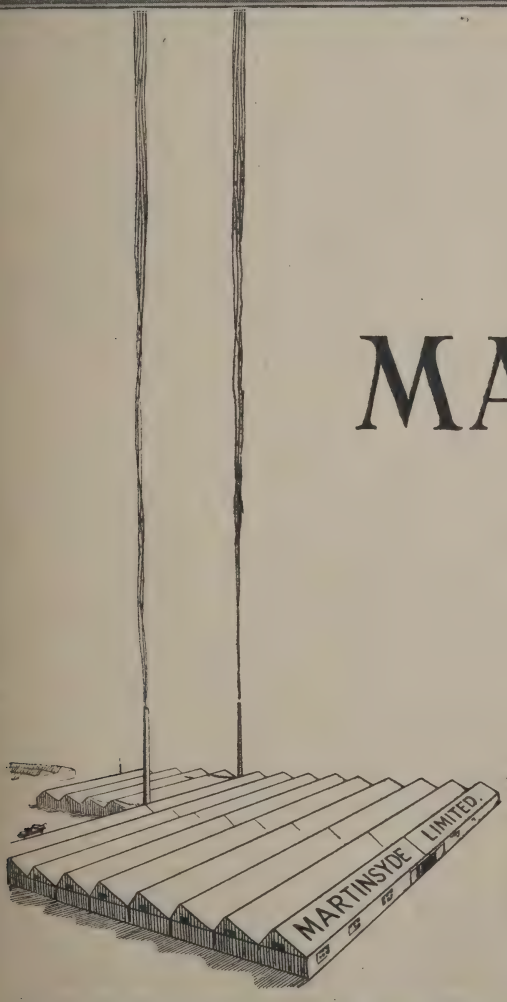
Take the case of an engine of which I know personally. It has done extraordinarily fine bench-tests, but the experimental engine was built so long ago that it is now admittedly too heavy for a modern aeroplane. It has been boomed off by one official after another till the people behind it are sick of the whole business, and will not put up the money to build a bigger and lighter sample, because they feel that this also would be boomed off for fear it should beat the officially favoured designs. Even if they put up the money, they would need more material and machinery to make it, and then they would be up against fresh departments in the endeavour to get the material and machinery.

Some really intelligent officer concerned with engines has written to one of the proprietors of the engine, saying, "It is suggested that it would be best for you to get in touch with the leading aero-engine designers and constructors, with a view to one or other of them interesting himself in [the special features of the engine] and possibly incorporating it in a future design." That seems reasonable enough at first sight. I suggested the same thing myself to the proprietors six months or more ago, on the off chance that the design might appeal to someone. But, as I feared, every engine firm has its own designer, and to ask a firm to take up an outside design, except under official inducement or pressure, as already exemplified, is about as hopeful a job as asking an official "expert" to adopt an outside design. The firm's designer is not likely to admit that the outside designer is cleverer than he is himself. One cannot expect in a mere commercial designer a higher standard of honesty and truthfulness than one finds in a technical official in the King's Service, even if one does not wholly accept Colonel Archer-Shee's *obiter dictum* that no officer in the King's Service is capable of lying.

The Round-the-Corner Way.



Another official, who apparently has the intelligence to appreciate the engine without the power to have it made, has offered to one of the proprietors a priceless piece of advice. He suggests that the designer of the engine, who is also part proprietor and constructor, and an excellent engineer, should get an appointment in some large controlled firm, introduce the engine there, get the firm interested in it, and then induce them to build a trial engine.



Now, there you have a perfectly priceless example of the way this country is run under our modern system of Socialism-run-mad. Instead of the Department concerned doing its job honestly, and using the nation's money to experiment with and test what is most promising, the Department as such merely blocks inventive talent and impedes progress in most necessary directions. But a few intelligent and earnest officials who have the nation's welfare at heart before their own go to some trouble and risk to advise worthy people how best to get round regulations.

Practically every step in progress and almost everything sensible which is done in this country at present is done in some such round-the-corner way as that suggested. There must be considerably more brain-power expended in this country per diem in getting round or dodging foolish Government regulations, and the orders of obtuse or foolish Government officials, than there is in straightforward effort to win the war.

A Cause for Wrath.

When one thinks of the suffering of our youngsters at the front, and of the gallantry they have shown under the most depressing conditions, all due to shortage of engines of the right sort, and when one thinks, and knows, that this shortage is caused entirely by gross ignorance, and wicked intrigue among the people whose duty it has been to expend their whole energy

in equipping the Flying Services adequately, one feels like going out for somebody's blood.

The papers and the House of Commons bleated loudly enough over the Mesopotamian scandal, and presumably some of the officers concerned have had their careers ruined, even if the politicians concerned have not. But why the outcry over Mesopotamia and not over the Flying Services? Presumably because at some time or another the ordinary stupid Englishman has had a pain in his stomach, or perhaps even a touch of dysentery, and has felt the heat of the sun too much for him. Therefore even his dull brain has been able to envisage the sufferings of those poor devils stewing in their own juice for fourteen days on an unshaded barge down the Tigris.

But never having been in an aeroplane, never having been a target for a shell or a bullet, and never having been in a life or death fight, the Englishman is unable to envisage the sufferings of the poor devils who have to put up the best fight they can against the finest aeroplanes in the world—in performance if not in construction—with underpowered aeroplanes and unreliable engines. Having forgotten most of what he learned about the flames of Hell in his youth, he cannot envisage the sensation of falling for interminable thousands of feet in a flaming aeroplane. And having too thick a skull ever to have hurt himself by falling on his head, he cannot envisage that sickening thud into the ground which mercifully puts an end to the troubles of the outclassed aviator.

Shake Out the Hindrances.

And because there is not sufficient agitation to stir up the public and so to shake up the Air Board into getting rid of its inefficients, one sees extracts from letters like this: "There seems no prospect of my fellows getting a new type of machine for the next four months. There seems nothing to be done, as the High and Mighty decide these matters quite regardless of results."

"We do the furthest work, but have the slowest fighting machines, bar about one type."

"It is useless complaining to —— or telling him that the machines are out of date, as he must know it already."

"Since this letter was started, a patrol has come in in tatters. Leader badly wounded, last man also. Both out in the country crashed. They were hopelessly outclassed and outpaced. It seems frightfully hard that they should suffer from lack of proper material."

"Things are pretty dismal. They are stopping the delivery of new machines for us, and supplying them for home defence. It may suit those at home, but certainly does not suit us out here."

"The engine we are using now was in active service in France 31 months ago, and has deteriorated in that time, due to the fact that it is made in England now."

And yet we have the finest aeroplanes and the finest engines in the world in this country, if we would only produce enough of them.

Those are not merely extracts from chronic grumblers. They represent the voice of experience. A few active-service pilots on the newest and best machines will perhaps disagree. But if only a dozen experienced pilots felt as those extracts indicate, would not that alone be enough reason for the complete reorganisation of engine supplies, and the institution of a sworn inquiry into the behaviour and actions of those who have been responsible for the failure of supplies of efficient aeroplanes and engines?

If it is worth the while of the Government to prosecute in the case of alleged taking of commissions on a few thousands or a few million pounds' worth of aeroplanes bought abroad, is it not worth the Nation's while to insist on the punishment of those who have cost us so many lives, and the waste of so much irrecoverable time and labour and material through their slackness, or incompetence, or intrigue, whichever it may be, in the production, or rather the non-production, of engines?—C. G. G.

TIMBER FOR AEROPLANES.

The following is from the "Sunday Times" of July 29th:—

Sir,—It is a point of notoriety in the timber trade, amongst those who know their business, that the lack of knowledge possessed by our legislators in general, from the Prime Minister downwards, in regard to timber has been very noticeable during the period of the war.

The assertion made by the Premier some little time ago, that the timber at present grown in this country was, if utilised, sufficient for our needs, is absurd.

To welcome a body of lumbermen into this country to fell timber, irrespective of the season, is really an outrage against the ordinary timber merchant.

To fell trees, of any nature, during a season when the sap is up, is against all principles of arboriculture. The disasters that would occur in consequence of using green timber felled with the sap in it has yet to be seen, and I think one should not be surprised to find some serious disaster in store in more than one direction.

Again, Dr. Addison, speaking about timber required for the manufacture of aeroplanes, made the extraordinary statement that the whole yearly output of spruce produced in the United Kingdom was needed, and further, that more mahogany was required than Honduras could supply.

I have yet to learn that there is any spruce grown in this country that is clean enough and in probable condition for aeroplane building, and I think I could suggest, from my knowledge of hard wood generally, that there are other places than Honduras from which to get mahogany for aeroplane building, and, moreover, there are quite a number of other woods that would do equally as well.

Whilst on the same subject, they do not refer to the scarcity of plywood, a wood that is generally used in seaplane and aeroplane building. There are large quantities of this wood ready for shipment, if the Government would only be guided by those who know, and provide means for shipping it, instead of which, although the scarcity is so acute, they leave this industry to get its oddments shipped as best possible.—Ut Prosim.

PREJUDICE.

The following letter appeared in the "Morning Post" of July 25th:—

Sir,—In your issue of the 19th inst. there appear two letters as to Mr. Winston Churchill's appointment as Minister of Munitions, one from Lord Stafford and the other Mr. James Glass. Your heading is "Mr. Churchill's Appointment Resented." It is resented by the people who have brains, and this resentment is not confined to a few. We, as the public, have to pay the gentleman in question, and, therefore, it is ourselves that should demand that proper service should be rendered us. Mr. Churchill has not proved himself efficient in any of the positions he has occupied in the Governments that he has graced with his presence. One cannot doubt his energy, his desire to do his best, yet it remains that he has not proved "good" in any of the positions. Antwerp, a ghastly fiasco. The Dardanelles worse. And the boast as to the "hornets" that he promised the public that the Huns would get stung by, where are they? Had Mr. Churchill been employed by a business firm he would have got the "sack," and his employers would not have been so generous as to give him a pension. Mr. Lloyd George has, as mentioned by Mr. Glass, flouted public opinion in appointing Mr. Churchill to the position of Minister of Munitions, and one can only hope that there will be such an outcry as to remove him from office in the Government during the war.—Yours, etc.,

W. H. G. SPINDLER.

[The letter only shows how far prejudice can go. The Antwerp affair resulted in holding up of the German advance in Belgium for six most critical days, and so enabled our Army in Flanders to occupy a better position than would otherwise have been possible. And all this at the cost of a couple of thousand untrained men interned in Holland, and a few casualties.

The Dardanelles business was a capital effort, spoilt by the muddling of other people. And the hornets were well on the way to being hatched when Mr. Churchill's incubating influence was removed, and his excellent plans were again muddled by incompetents. It is curious how people fix on just the wrong points on which to abuse Mr. Churchill.—Ed.]

THE FUTURE OF THE ROYAL FLYING CORPS.

SOME POSSIBILITIES.—III.

BY "BERKELEY."

General the Earl of Wellington, in a letter written to the Earl of Liverpool, Prime Minister of England, from Fuente Guinaldo, in Spain, on June 10th, 1812, said that "The foundation of every system of discipline, which has for its object the prevention of crimes, must be the non-commissioned officers of the Army." The mythology of popular military history also gives the same distinguished soldier, when in later days he had attained the ducal state and had earned the baton of a field marshal, the credit of the authorship of the phrase which in convincing baldness says that the non-commissioned officer is the backbone of the British Army.

The Eternal Spirit.

The times have changed, and generations have come and gone since men died under Wellington in Spain, but the British Army has not greatly varied its virtues or its vices. The march to Coruña and the march from Mons are brilliant with the same courage and pertinacity. Salamanca and Ypres have seen the same manner of war. Badajoz and Cologne—shall we say?—may bear fateful resemblance in their respective days of historic prominence. The spirit of the soldier has not altered. The sergeant who sweltered in his scarlet tunic on the fire-swept beach of Aboukir in 1801 could sympathise with true insight in the troubles of the later sergeant who landed in all the pomp and horror of war at Cape Helles over eleven decades later.

The non-commissioned officer is to-day, as ever, a vitally important section of the Army. He represents stability. Under peace conditions of short service, whether conscript or voluntary, the rank and file are constantly changing. Even in the commissioned ranks the periodic change is considerable. Some officers retire, others are posted to the staff, and others resign when the monotony of the life overcomes its attractions.

The Back-Bone of the Army.

But in the intervening ranks there is a greater duration of service. The non-commissioned officer remains true to the life of the regiment. He rarely transfers to other units, and he invariably spends the best years of his life with the corps in which he began. He learns his work by experience both in the ranks and in his small command. As the training is slow, it is all the more sure. He keeps alive the tradition of the regiment with the new recruit, and he steadies imperceptibly the sweeping impetuosity of newly joined officers.

It is not possible to reduce to terms of speech the part the non-commissioned officers of the old Army have taken in the formation and the training of the legions which now follow the King's bugles beyond the seas. To them is due a very large share of the credit. There are few officers now serving who will have the temerity to gainsay this.

Abroad in the more efficient armies it has been much the same. The whole system of the German army is bound up in the skill and efficiency of the non-commissioned officer. He is responsible for a large share of unit administration in times of peace, and in action it is he who leads the men in minor tactical operations.

The German officer undergoes a more intensive and continuous initial training than is common with us or in other European armies, and he is considered by the Higher Command to be of too great value to be carelessly expended in the routine fighting of the daily war. His duties are to direct and not to lead in the fight, unless occasion demands the supreme sacrifice. He is then no less willing to demonstrate his courage than are his enemies. In days of peace, when he is not carrying out the work of the day, he is generally adding to his knowledge of his chosen profession by continual study of the military literature which appears in profusion when the distraction of war is absent. His range of technical military knowledge, man for man, is greater than that of his corresponding rank in the British Army, but he is less in touch with his men, and he rarely understands the art of personal leadership. He is proper to the conditions of his own army, but he could never attain success if he had the direction of British soldiers.

The high degree of professionalism of the German officer brings the non-commissioned ranks into greater prominence in the German Army than is elsewhere the case. The well-trained non-commissioned officer is essential to success. His duties, in so far as the higher ranks are concerned, in some manner compare with those of English subalterns, and his responsibilities are not less.

The Direct Entry N.C.O.

There is an essential difference in the manner by which the non-commissioned ranks are filled in the British and the German armies. Here, in England, from corporal to sergeant-major, all are promoted from the ranks after a varying period of unblemished service. None, save in the emergency of war, is taken in by direct entry.

In Germany the 90,000 non-commissioned officers in the army during times of peace are obtained in two ways. The majority—that is, from 70 to 75 per cent.—are drawn from the ranks, as is the custom in other countries. The remainder, between the ages of 14½ and 17, enter special preparatory schools for non-commissioned officers, and undergo a course of general education for a period of two years.

From this class of school those who are satisfactory pass to one of the nine non-commissioned officers' schools in Germany for a further two years' course, this being spent in the acquisition of the rudiments of military science. Some men enter these schools directly from civil life, in which case they must remain for a period of three years.

Those whose conduct and efficiency are most highly gratifying to the responsible authority receive their due reward in being posted as *Unteroffizier* (underofficer) to such regiments as they have selected in earlier times. Less successful aspirants become *Gefreiter* (lance-corporal), or are placed in the ranks, from which they emerge a few months later should intelligence have come to them at the behest of experience.

Young though the latter classes are in comparison with those who have risen from the ranks in the ordinary course, they are much sought after as *Feldwebels* (sergeant-major) and *Zahlmeister-Aspirant mit Feldwebel-Rang* or *mit Sergeant-Rang* (Aspirant Paymaster). No definite news has come through as to the behaviour of the non-commissioned officers during the present war, but it is known to have been good. They have not been lacking in courage nor in intelligence commensurate with their positions in the army.

In any reformation of the Royal Flying Corps which disconnects the duties of the piloting and of mi...

AIRCRAFT SUPPLIES!

"ASCOL" SERVICE MEANS INCREASED OUTPUT.

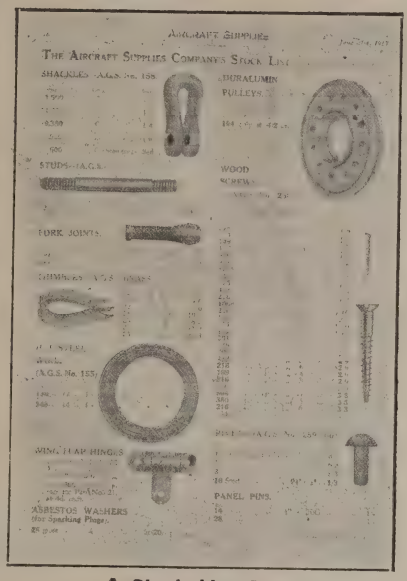
A.G.S & STANDARD PARTS from STOCK. SPECIAL AIRCRAFT & ENGINE PARTS for EARLY DELIVERY

For Illustrated Stock and Quotation List see

"Aircraft Supplies"

Our Fortnightly House Journal

NOTICE



Owing to the August Holidays, the next issue of "Aircraft Supplies" will not appear until Thursday, Aug. 16th.

Special Stock Letters will, however, be sent to all Manufacturers and Storekeepers, giving prices and quantities of parts in stock for immediate delivery, on Wednesday, Aug. 1st, and on Saturday, Aug. 11th. Copies will be sent to others on request.

Published fortnightly, on alternate Thursday evenings, and issued FREE to the Air Services and to the Aircraft Industry (those in charge of Stores and other Works or Service Departments ONLY), on application to the Secretary.

Contains a complete LIST OF STOCK of Aircraft Parts up to the time of going to press, CURRENT PRICES, details of NEW ITEMS, ENQUIRY BUREAU, and other A.S.C. Announcements. A SHORT ARTICLE will also appear in each issue on a topic of interest to Aircraft Constructors.

Stock List contains over 400 items.

A Stock List Page.

Send us a COMPLETE LIST of your requirements, and we will return this to you in course of post with the prices marked against those items we can supply FROM STOCK, or deliver quickly.

observation from the rank of officer there would be a consequent change in the position and duties of the non-commissioned officers. Would it not be possible, if one be permitted to assume that everything that is German is not inherently bad, to adopt the system of obtaining a percentage of non-commissioned officers by direct entry after a period of training in special schools formed and maintained for the purpose?

The Intermediate Class.

There are particular conditions which would make such a system of high value to such a unit as the Royal Flying Corps. The nature of the life and often an accompanying ignorance of its duties attracts to the corps types of pilots or engineers who, while neither mentally nor socially fit for commissioned rank, are possessed of too many prominent attributes to permit of their happy or profitable inclusion in the ranks.

Moreover, the officer of the future will differ from the temporary and gallant substitute of wartime in that he will be highly trained in the intricacies of his profession. His knowledge will not be restricted to facility in a vivid but accurate imitation of the natural or unnatural evolutions of the least respectable fowls of the air, nor to a spectacular species of aerial letter-writing with an overheating machine-gun as pencil and a resilient German body as the impressionable material on which it is desired to inscribe a mark.

Therefore only such candidates as have a due regard for the proprieties of war and have proved either their knowledge of its rules or their intention of learning the art of authorised murder should be accepted for the King's Commission in the Royal Flying Corps.

In such case those who did not care for mental effort and whose chief interest was in the practical art of flying might, if their standard of education and moral fitness were proper, be admitted to a training school with a view to admission as a non-commissioned officer at the end of the course.

By this means there could be formed a powerful body of mechanics, who in the placidity of civil life would be graded as foremen, and of pilots whose skill would have meant fortunes if aviation had never outgrown its infancy. A class would be attracted which, unwilling to become officers from an honest recognition of unfitness, yet would not care to serve in the ranks alongside men whose unpaid tobacco bills had made civil life displeasing to them.

Our Versatility.

Promotion of rankers would be but little interrupted, as the direct-entry class should be a fixed low percentage of the whole, and difficulties of seniority could be adjusted in the necessary Royal Warrant authorising the change. Precedent does not matter, as a nation which can give official sanction to so charming a title as "Tank Corps" is capable of almost anything in the entire world.

One of the chief difficulties in the formation of a unit—especially one so large and important as the Royal Flying Corps—is the selection and training of a body of non-commissioned officers. Other regiments do not care to permit N.C.O.'s to transfer, so valued are they in the military world, unless, indeed, they are inefficient, in which case nobody wants them.

Once selected and trained, it is not desirable that N.C.O.'s of a unit should be on short service, or that they should be promoted to commissioned rank, unless in the latter case it is quite clear that a good officer will be made and not simply a good non-commissioned officer spoilt.

The scheme briefly suggested in this article may be visionary; it may in the view of some be impracticable; but it is perhaps not unworthy of consideration.

MR. HOLMAN AT HENDON.

Mr. Holman, Premier of New South Wales, was given facilities by the Air Board for visiting the works of the Aircraft Manufacturing Co., Ltd., on July 27th, where he was received and shown round by Mr. Holt Thomas. Before he left Australia Mr. Holman took a prominent part in the establishment of a State Aviation School at Richmond, near Sydney, in connection with which it is hoped to erect a factory. Mr. W. J. Stutt, late of the Bristol Co., is in charge of the school.

Mr. Holman's visit to Hendon was arranged in order that he might have an opportunity of seeing the extent to which aeroplane construction has been carried in this country, and of obtaining information which might be of value in the erection of works in New South Wales. He was impressed by the demonstration of skill in design, as well as the industry displayed in construction, and after visiting the factory he proceeded to Hendon aerodrome, where he witnessed an excellent exhibition of flying.

War Office, July 24th.

REGULAR FORCES.—Staff.—The following temp. appt. is made at the War Office :—G.S.O., 2nd Grade.—Major M. Freeman, Worc. R., Spec. Res., from a Staff Officer, R.F.C., 2nd Cl., vice Bt. Lt.-Col. R. J. Armes, N. Staff. R., April 25th.

Establishments.—R.F.C.—Mil. Wing.—Staff Officer, 2nd Cl. —(Graded for purposes of pay as a G.S.O., 2nd Grade, at the War Office).—Major M. Freeman, Worc. R., Spec. Res., from Adjt., Feb. 28th.

Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld. :—Sec. Lt. S. E. Brown, Spec. Res., July 7th. Lt. S. H. Clarke, M.C., Wilts R., Spec. Res., July 10th.

Memorandum.—Temp. Sec. Lt. H. Bromley, R.E., relinquishes the rank of temp. Capt. on ceasing to be empld. with R.F.C., July 6th.

War Office, July 25th.

REGULAR FORCES.—Staff.—Dep. Asst Dir.—Sec. Lt. (temp. Capt.) G. W. A. Brown, R.F.C., Spec. Res., from an Equipment Officer, 1st Cl., and to retain his temp. rank whilst so empld., vice Capt. (temp. Lt.-Col.) F. A. Wanklyn, M.C., R.A., July 4th.

War Office, July 26th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing. —Sqdn. Comdr.—Capt. (Temp. Maj.) A. H. Jackson, Notts and Derby R., from a Chief Instr. in Gunnery (graded as a Sqdn. Comdr.), School of Mil. Aeronautics, and to retain his temp. rank whilst so empld., July 5th, seny. Oct. 25th, 1916.

Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld. :—Lt. E. M. Lugard, R. Lanc. R. ; Lt. J. Butler, M.C., R. Ir. Fus. ; Sec. Lt. A. C. Reeves, Spec. Res. ; Temp. Sec. Lt. C. D. Smart, Gen. List, July 12th. Temp. Lt. H. W. Woollett, Gen. List ; Lt. S. R. P. Walter, R. W. Surr. R. ; Temp. Sec. Lt. (temp. Lt.) L. A. Hardwicke-Terry, R.E. ; Sec. Lt. St. C. C. Tayler, R. Suss. R., July 13th.

Adjt.—Maj. Lord R. E. Innes-Ker, I. Gds., Spec. Res., from a special appt. (graded as a Park Comdr.), July 4th.

Park Comdr.—Capt. A. F. A. Hooper, N. Staff. R., from an Equipment Officer, 1st Cl., and to be temp. Maj. whilst so empld., June 23rd.

Memorandum.—Gen. List.—The undermentioned to be temp. Sec. Lt.—June 26th, 1917 : Sec. Cl. Air Mech. Ronald Ponting Allison.

* * *

The King has been pleased to approve of the appointments of the following officers to be Companions of the Distinguished Service Order in recognition of their gallantry and devotion to duty in the field :—

Sec. Lt. (temp. Capt.) John Oliver Andrews, M.C., R. Scots and R.F.C.

For conspicuous gallantry and devotion to duty in leading offensive patrols with great dash and success on over 30 occasions, and taking part in over 22 combats. His skill and courage in attacking and destroying hostile aircraft have at all times been magnificent.

Sec. Lt. Samuel Hollis Alfred D'Arcy, R.F.C., Spec. Res.

For conspicuous gallantry and devotion to duty, in continually attacking and dispersing hostile infantry and transport from a very low altitude. Whilst engaged in this he was wounded, but refused to return until he was almost unconscious. He also showed great courage and determination on several occasions in attacking hostile aircraft, destroying some and forcing others to descend.

* * *

The King has been pleased to award a Bar to the Military Cross to the following officer :—

Lt. (temp. Capt.) William Victor Strugnell, M.C., Hamps. R. and R.F.C.

While leading an offensive patrol he attacked and brought down a hostile machine. Later, in the same patrol, he brought down a second machine. In all, he has accounted for five machines and a kite balloon. (M.C. gazetted June 3rd, 1916.)

* * *

The King has been pleased to confer the Military Cross on the following officers in recognition of their gallantry and devotion to duty in the field :—

Sec. Lt. (temp. Lt.) Robert Stanley Aitken, R.G.A. and R.F.C.

On several occasions he made most valuable reconnaissances of the enemy's line, and on two successive days he engaged and severely damaged hostile batteries, working under most adverse weather conditions.

Sec. Lt. Valentine Henry Baker, Gen. List and R.F.C.

In a large number of aerial combats he showed the greatest daring and determination. On one occasion alone, he flew at a low altitude over the enemy lines, attacking and dispersing enemy artillery, infantry, and transport, and returned with a valuable reconnaissance report concerning the retiring enemy.

Sec. Lt. Giles Noble Blennerhassett, R. Ir. Fus., Spec. Res. and R.F.C.

He has shown great skill and courage when acting as escort in attacking hostile formations. On one occasion he attacked two hostile machines, driving both down out of control. Later, he forced three other machines down.

Sec. Lt. Hamilton Blofeld, R.F.C., Spec. Res.

For conspicuous gallantry and skill. Whilst registering a long range gun, he was attacked by five Albatros Scouts, and was severely wounded in several places, the observer being shot through the wrist. The petrol tank having been pierced, he flew back to his own aerodrome, and was unconscious when taken out. His courage and skill saved both their lives.

Sec. Lt. (temp. Lt.) Jocelyn Ernle Sydney Patton Bradford, W. Rid. R. and R.F.C.

On three separate occasions his accurate information enabled our artillery to engage and destroy enemy guns and emplacements. He afterwards attacked and inflicted serious damage upon a hostile battery, using his machine-gun from a very low altitude.

Temp. Sec. Lt. Geoffrey Hornblower Cock, Gen. List and R.F.C.

On many occasions he showed great courage and determination in attacking and destroying hostile aircraft, and in dispersing hostile troops from a low altitude. His skill as a formation leader has set a fine example to the other pilots of his squadron.

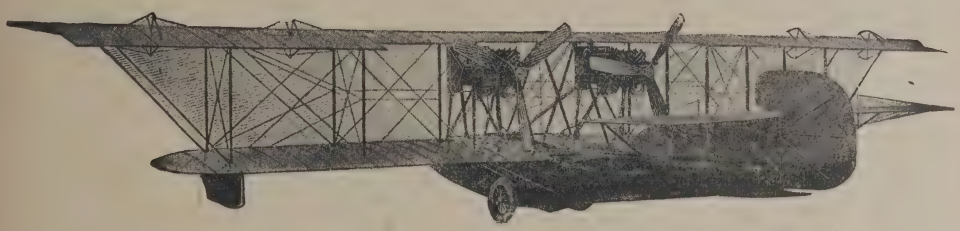
Sec. Lt. (temp. Lt.) Stanford Gavin, Devon R. and R.F.C.

As observing officer in the artillery he showed great ability and conspicuous courage under shell fire. On two occasions he was compelled to parachute down from burning balloons, but this in no way lessened his enthusiasm. The loss of a foot necessitated his being sent home, and his valuable services have been greatly missed.

Temp. Sec. Lt. Albert Earl Godfrey, Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty in constantly attacking hostile machines at close range, regardless of personal risk or of their being in superior numbers.

Lt. Rogert Bolton Hay, W. York. R., Spec. Res. and R.F.C.



On several occasions he has shown the utmost courage and dash in attacking and dispersing hostile aircraft in superior numbers. His willingness to undertake the most hazardous duties has at all times set a fine example to other pilots and observers of his squadron.

Temp. Lt. Thomas Falcon Hazell, Gen. List and R.F.C.

On several occasions he displayed marked courage and determination in attacking and destroying hostile aircraft.

THE NORMAN-THOMPSON FLIGHT CO., LTD.

DESIGNERS & CONSTRUCTORS OF FLYING BOATS.

The Type for Commerce

AS WELL AS FOR WAR.

Works:
MIDDLETON
BOGNOR.

London Office:
DEWAR HOUSE,
HAYMARKET, S.W.1.

Temp. Lt. Fred Parkinson Holliday, Gen. List and R.F.C.

In company with another pilot he attacked five hostile aircraft, setting one on fire, driving down another out of control, and dispersing the remainder. He has previously done fine work, bringing down eight hostile machines in all.

Sec. Lt. Jeffrey Batters Home-Hay, Arg. and Suth'd Highrs. and R.F.C.

He showed consistent ability and courage in observing for and ranging our artillery upon enemy guns and trenches. His accurate information was of the greatest value to our batteries.

Temp. Sec. Lt. Geoffrey Knight, Gen. List and R.F.C.

He showed great dash and promptness in diving to the assistance of one of his squadron, who had been attacked by five hostile scouts, and dispersing them. His assistance to our artillery in engaging hostile batteries from a low altitude was of the greatest value.

Sec. Lt. Matthew Laurence Maguire, Conn. Rang. and R.F.C.

With great courage and skill he attacked and completely destroyed an enemy aeroplane, which crashed to the ground from 4,000 ft.

Sec. Lt. (temp. Capt.) Reginald George Hewitt Pixley, R.F.A. and R.F.C.

He attacked a hostile balloon with three other pilots and, remaining after they had left, finally sent it down in flames. He has assisted in bringing down several hostile machines, and has done good work throughout.

Sec. Lt. Robert Wolstenholme Reid, R.F.C., Spec. Res.

He has done fine work in taking aeroplane photographs. This work has been carried out while flying at very low altitudes and often under very heavy machine-gun fire.

Capt. (temp. Maj.) Alan John Lance Scott, Yeo. and R.F.C.

He has on several occasions attacked and destroyed enemy aircraft, and taken successful photographs under heavy fire. He has constantly shown the greatest courage in attacking numerous hostile machines single-handed, during which on two occasions his own machine was considerably damaged. His great coolness, dash, and resource have set an excellent example to his squadron.

Lt. (temp. Capt.) James Geoffrey Selby, R.F.A. and R.F.C., Spec. Res.

During a photographic reconnaissance he was attacked by five hostile scouts, whom he put to flight, continuing his work with complete success. He afterwards attacked and put to flight an enemy battery. His work at all times has been marked by the greatest courage and ability.

Lt. Oliver Manners Sutton, S. Lanc. R., Spec. Res. and R.F.C.

On at least eight separate occasions he showed great determination in attacking hostile aircraft, destroying them or driving them down out of control, and he has also done very good work in other flights by preventing hostile aircraft from getting on the tails of other machines. On one occasion, though his gun jammed, he dived three times and drove off an enemy machine.

Sec. Lt. Patrick Gordon Taylor, R.F.C., Spec. Res.

He has taken part in over 40 offensive patrols at low altitudes and under heavy fire from the ground. He has always shown exceptional dash and gallantry in attacking large formations of hostile machines, setting a very fine example to all his comrades.

Sec. Lt. (temp. Capt.) Stanley Wedgewood Taylor, R.F.C., Spec. Res.

He has at all times shown the greatest fearlessness, especially in volunteering for any duty entailing special risk. His dash and determination in engaging hostile machine-guns, transport, and bodies of troops from a very low altitude have been most marked.

Temp. Lt. Robert Parker Musgrave Whitham, North'd Fus. and R.F.C.

On four successive days he showed remarkable courage and ability in bombarding enemy positions, and, working in conjunction with our artillery, he rendered them most valuable information.

CANADIAN FORCE.

Lt. Albert Edward Pickering, Infy. and R.F.C.

For conspicuous gallantry and devotion to duty when acting as an observer, in making reconnaissances at very low altitudes, and attacking hostile infantry, transport, and machines with great courage and determination. In conjunction with his pilot, he was instrumental in destroying several hostile machines, and in rendering valuable information to our artillery.

The King has been pleased to approve of the award of the Distinguished Conduct Medal to the following man for gallantry and devotion to duty in the field :—

8202 Sec. Cl. Air Mech. R. C. Cooper, R.F.C.

WAR OFFICE, July 27th.

REGULAR FORCES—ESTABLISHMENTS.—R.F.C.—MIL. WING.—Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld. :—Sec. Lt. (temp. Lt.) R. S. Aitken, R.G.A., T.F., July 9th. Temp. Lt. H. A. Tweedie, Gen. List, April 10th, but without pay prior to July 12th.

SCHOOLS OF INSTR.—SCHOOLS OF MIL. AERONAUTICS.—Chief Instr.—(Graded as a Sqdn Comdr.).—Temp. Capt. H. C. Wakefield, Gen. List, a Flt. Comdr., and to be temp. Maj. while so empld., vice Capt. (temp. Maj.) A. H. Jackson, Notts and Derby R., July 5th.

* * *

The names of the following have been brought to the notice of the Secretary of State for War for distinguished services rendered in connection with the war :—

Livingston, Maj. (temp. Lt.-Col.) G., C.M.G., Lond. R. and R.F.C.

Salmond, Maj. and Bt. Lt.-Col. (temp. Brig.-Gen.) J. M., C.M.G., D.S.O., R. Lanc. R. and R.F.C.

Valentine, Capt. (temp. Maj.) J., R.F.C., Spec. Res.

WAR OFFICE, July 28th.

MEMORANDUM.—Bt. Lt.-Col. (temp. Brig.-Gen.) J. M. Salmond, C.M.G., D.S.O., R. Lanc. R., to be temp. Maj.-Gen. whilst commanding a Training Brigade, R.F.C., June 22nd.

REGULAR FORCES.—STAFF.—ATTACHED TO HD.QR. UNITS.—Brig. Comdrs.—From Group Comdrs., R.F.C., and to be temp. Brig.-Gens. whilst so employed. :—Maj. (temp. Col.) H. C. T. Dowding, R.A. ; Bt. Maj. (temp. Col.) P. L. W. Herbert, Notts and Derby R., June 22nd.

ESTABLISHMENTS.—R.F.C.—MIL. WING.—Staff Officers, 1st Cl.—Graded for purposes of pay as A.A.G's., and to be temp. Lt.-Cols. whilst so empld. :—Capt. N. J. Gill, M.C., R.A., from the 2nd Cl. ; Lt. (temp. Capt.) F. C. Shelmerdine, Res. of Officers, from the 2nd Cl., June 22nd. Maj. A. L. Godman, D.S.O., York. R., from a Brig.-Maj., July 16th. 2nd Cl.—Graded for purposes of pay as Brig.-Majs.—Temp. Capt. V. W. Brown, M.C., Gen. List, from the 3rd Cl. ; Lt. (temp. Capt.) T. E. Longridge, A.S.C., from Adjt., and to retain his temp. rank whilst so empld., June 22nd.

Sqdn. Comdrs.—From Flt. Comdrs., and to be temp. Majs. whilst so empld. :—Lt. (temp. Capt.) S. W. Smith, R.A., March 12th. Capt. S. Grant-Dalton, D.S.O., York. R., but without pay or allowances prior to June 26th. Capt. A. R. Stanley-Clarke, M.C., Dorset R., May 1st. Capt. R. A. Archer, M.C., R.A. ; Sec. Lt. (temp. Capt.) R. J. Mounsey, Hamps. R., July 1st.

Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld. :—Temp. Lt. R. M. Drummond, Gen. List, May 25th. Lt. O. M. Sutton, S. Lan. R., Spec. Res., July 10th.

Spec. Appts. (Graded as Park Comdrs.).—From Equipment Officers, 1st Cl., and to be temp. Majs. whilst so empld., June 22nd :—Lt. (temp. Capt.) G. S. Peacock, Spec. Res. ; temp. Capt. N. F. D. Buckeridge, Gen. List ; Lt. (temp. Capt.) G. L. Main, Spec. Res.

Equipment Officers, 1st Cl.—From the 2nd Cl., and to be temp. Capts. whilst so empld., June 26th :—Temp. Lt. F. C. O. Shaw, Gen. List ; temp. Lt. G. E. Morris, Gen. List.

* * *

The King has been pleased to award the Military Medal for bravery in the Field to the following man :—

6705 1st Cl. Air Mech T. Reynolds, R.F.C.

WAR OFFICE, July 30th.

REGULAR FORCES—ESTABLISHMENTS.—R.F.C.—MIL. WING.—Flt. Comdrs.—From Flying Officers, and to be temp. Capts, whilst so empld. :—Temp. Lt. A. N. Solly, Gen. List ; Sec. Lt. (temp. Lt.) A. T. Rickards, R.A., July 12th. Sec. Lt. J. Noakes ; temp. Sec. Lt. J. D. Atkinson, R.E., July 13th. Sec. Lt. A. S. Shepherd, Spec. Res., July 15th. Temp. Lt. G. K. Smith, Gen. List, July 17th.

NAVAL.

The following appointments have been made in the Royal Naval Air Service :—

JULY 25th.—Mr. J. H. Sayner granted a temp. commission as Lt. (R.N.V.R.), seny. July 24th.

JULY 26th.—Sub-Lt. (temp., R.N.V.R.).—A. E. Reed, promoted to Lt. (R.N.V.R.), seny. June 30th.

Temp. commissions (R.N.V.R.) have been granted to the following, seny. July 25th :—Lts.—T. M. Gerrard, E. J. Castell, H. O. P. Hammond, B. J. S. Brown, E. G. Millar, P. W. Goodchild, H. S. Kelly, S. P. Holloway, F. H. Stanton, C. F. Hannaford, and S. T. Buckland.

ADMIRALTY COMMUNIQUÉ.

JULY 30th.—During the night of the 28th inst. bombing raids were carried out by the Royal Naval Air Service on works at Bruges and in the areas of Thourout, Middelkerke, and Gistelles.

(*Continued on page 325*).

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The British Aircraft Industry.

BY CHARLES L. FREESTON.

XXIV.—THE COWPER-COLES AIRCRAFT CO.

Quite unique among aeroplane producing firms is the *raison d'être* of the Cowper-Coles Aircraft Co., of Sunbury-on-Thames. The company is neither known to fame among pre-war designers nor as one of the many big manufacturing firms in either fields which have temporarily or permanently devoted their resources to the building of aircraft under the stress of war-time emergencies. But it is destined to transform the known riverside village of Sunbury-on-Thames, and probably make no small impression on the aircraft industry itself, by reason of the fact that it has embarked upon aeroplane production on totally new lines, in furtherance of inventions of proved value on the part of a scientist of repute.

Noteworthy Inventions.

Mr. Sherard Osborn Cowper-Coles is an engineer (both mechanical and electrical), a chemist, and a metallurgist, and has attained distinction in each of these several fields. His father was the famous Captain Cowper-Coles who invented the armoured turret for ironclads, and was awarded a C.B.

Devoting himself mainly to research and analytical work, Mr. Cowper-Coles has evolved two of his many processes of a particularly noteworthy character—one so far back as fifteen years ago, and the other much more recently. The first is "Sherardising," or the method of making steel and iron rustless, and the second is a system by which copper tubing can be produced by electrolytic deposits, with results that are nothing if not astounding in respect of strength and lightness.

Indeed, if one picks up a length of tubing of this type, one finds that it is all but impalpable, so extraordinary is its lack of weight; instead of consciously handling a piece of metal, the sensation that one derives is more akin to that of taking up a piece of tissué-paper, if that could be fashioned in tubular form.

Mr. Sherard Osborn Cowper-Coles.

A New Company

In aeroplane work it is obvious enough that rustless metal and light but strong tubing may each play a great part, and it was for this reason that Mr. Cowper-Coles formed some eight months ago the company which bears his name. Buildings were set up in the immediate neighbourhood of his charmingly situated house at Sunbury-on-Thames, and a considerable number of employees have been employed on two lines of work—the making of rustless metal parts and the building of aeroplane wings to the order of the Air Board.

Great Developments.

But much greater developments, of far-reaching extent, are now in progress. An estate of 33 acres, together with a large house containing 39 bedrooms, has lately been acquired and the said house will shortly be converted into offices and a hostel, while the estate will witness the uprising of large workshops devoted to aeroplane production on an important scale. The estate has a frontage, moreover, of 370 ft. on a backwater of the Thames, and here will be erected a seaplane shop and a launching stage on the river bank.

All-Metal Machines.

The type of machine in which the firm will specialise will be "all-metal," even as to the planes themselves, with metal struts and ribs, and sheet steel in lieu of the familiar fabric. Even the propellers will be of metal, and, as a matter of fact, their manufacture has already been begun.

Concurrently with the production of land and seaplanes will be carried on a large business in the making of parts of all kinds in rustless metal. Rust, as an enemy to be feared, is too well known to make it necessary to say more than that the future of the undertaking will be watched with more than ordinary interest.

A Remarkable Revival.

It may very naturally be asked why the process of Sherardising—so called after the inventor's first baptismal name—has suddenly, as it were, come into prominence at this juncture, albeit it has been in existence for a good number of years. For lately in the ironmongers' shops one has seen rustless cutlery on sale, and only a few days ago I saw some rustless golf clubs in the professional's shop at the links where I happen to play. But in the Royal Aero Club a short time ago the Sherardising process happened to come under discussion, and a member stated that he had had a set of rustless golf clubs for many years. Why, therefore, has the system lain dormant, or apparently dormant, for so long, and why do we witness this remarkable revival?

Mr. Cowper-Coles has provided me with the explanation. So far as the revival is concerned, that is due to the fact that the patents have expired, and certain cutlery manufacturers have been wise enough to take up the system.

As for the relatively small use that has been made of the process, that has simply been commensurate with the degree of energy devoted to the pushing of their system by the company which had the handling of the goods. Mr. Cowper-Coles himself, in fact, long ago parted with his patent rights in disgust because so little use was being made thereof. I am told that rustless golf clubs have been obtainable at one particular stores for many years, but though I have been playing golf for a dozen years I never saw implements of this kind until, as mentioned above, a few days ago.

Characteristic.

Now in this one field alone there was almost a fortune, with proper handling, for every golfer would appreciate the possession of a set of clubs which would not require perpetual cleaning. Every housewife, too, would welcome rustless knives if their advantages were properly impressed upon her notice; but the art of advertising has never been properly understood in England, and I for one doubt if it ever will. Pills and all manner of worthless abominations confront us right and left by advertisement suggestion, but oftener than not people who have the luck to get hold of a good thing do not understand the rudiments of the art of reaching the public.

In America, it may be added, large firms have taken up the Sherardising process, and Mr. Cowper-Coles was even awarded the distinction of the Scott medal for creating a new industry. And this, by the way, is not by any means the only example of America welcoming with open arms what has been given the cold shoulder in the country of its origin; indeed, one case might be mentioned which is intimately connected with aeroplane construction.

A Great Discovery.

Now that the Sherardising process, therefore, is destined to figure much more prominently than heretofore in the industrial world, it will not be out of place to describe its origin and its nature in detail. Scientifically it was referred to by its inventor as "vapour galvanising," and was discovered during the course of some experiments in connection with the annealing of cast iron.

It was found that zinc dust would volatilise, if in contact with another metal, at a much lower temperature than the ordinary melting point; in other words, a piece of iron placed in zinc dust, and heated to a temperature several hundred degrees below its melting point, would be quickly coated with zinc. Mr. Cowper-Coles was quick to realise the commercial possibilities of this phenomenon, and rustless metal came into being accordingly, though unfortunately, as has been pointed out, it has never been effectively exploited.

Some Advantages.

"The advantages of vapour galvanising are that it is cheaper than the ordinary hot galvanising, forms a better protection, and at the same time enables screw threads and machine work to be coated with an even distribution of zinc, and that the parts fit together and work quite freely, proper allowance having been made for the required thickness of the zinc."

The proof of this statement, which was made by the inventor to the Society of Chemical Industry, so far back as 1909, may be seen to-day by anyone who picks up a Sherardised screw at the Sunbury works; the threads are as sharp as if they had not been zinc-coated at all.

Novel Features.

One novel feature in connection with the process is that articles coated with grease receive as good a coating of zinc as those which are free from grease. This fact enables such articles as bolts, nuts, screws, etc., to be thrown direct, after machining, into the Sherardising drum without any cleaning or preparation whatever. The articles, when they have been heated in zinc dust for the period necessary to obtain the required thickness of zinc, can be removed whilst the zinc dust is still hot, although the better practice is to allow the zinc dust to cool to a temperature at which the articles can be readily handled, as the deposit of zinc is whiter and less oxide of zinc is formed.

Incidentally the process of dry galvanising offers many facilities and great economy to those manufacturers who have not sufficient work to keep a large bath of molten zinc continuously employed. Articles can be Sherardised at a few hours' notice, starting from cold, as the drums in which the zinc dust is volatilised can be heated by gas or coke furnaces, and the whole operation only occupies a few hours.

Valuable Properties.

Other very interesting features may be mentioned in connection with the process. Sherardised iron and steel are found in practice to withstand the ordinary corrosive agents to which galvanised iron is exposed to a remarkable degree, while even after the apparent removal of all the zinc by filing or abrasion the iron is still non-corrosive. This valuable property is believed to be due to the protective action of the zinc-iron alloy formed on the boundary line between the iron and zinc.

Another valuable feature is the fact that as Sherardising is effected at a very much lower temperature than hot galvanising, the temper of steel wire is not reduced as it is in the latter process. Steel and iron bolts, moreover, Sherardised at varying temperatures, have been found, when tested for tensile strength, to be equal to bolts which had not been Sherardised. The importance of these facts in connection with aeroplane work can hardly be over-estimated.

Art Metal Work.

Finally it may be stated, as a matter of interest, although not directly concerned with aircraft work, that there is a great future for Sherardising in connection with the inlaying and decorating of metallic surfaces; in America, in fact, this subsidiary feature has been extensively developed.

Mr. Cowper-Coles hopes, after the war, to found a village industry at Sunbury-on-Thames in this connection, and we shall certainly see the last of the egregious "art" metal work which has hailed from Germany. By the Sherardising process designs can be inlaid by the use of stencils, or an artist can draw his own design directly on the plate; hence the artistic possibilities of the system are illimitable. A great variety of effects can be obtained, and a number of metals can be blended which were formerly incompatible, while alloys of many colours and tints can be obtained in the one operation.

Meanwhile it remains to be seen what manner of machine emanates from the Sunbury workshops when they are in full blast, for there are "talking points" about an all-metal system which are too numerous to need particularisation.

USEFUL PREPARATIONS.

The National Chemical Works, Ltd., of Stanley Road, South Acton, market two chemical products, which should be of use to aircraft manufacturers, and also, in one case, to aeroplane pilots.

The first preparation is "Pulleystone," a paste intended for application upon the working faces of driving pulleys. The paste solidifies, forms a substance as hard as stone, and practically forms part of the pulley itself, and it is claimed that so treated the adhesive properties of the pulley are increased considerably.

It is also claimed that as the use of "Pulleystone" obviates the necessity for belt dressings, the fabric of the belt does not deteriorate, and that, therefore, increased life and power results.

The second preparation, which is of especial interest to aviators, is known as "Permanite." It is an adhesive cement of special qualities, which will cleave to iron, steel, brass, copper, aluminium, etc., even when highly polished. When set, it will resist the action of petrol, benzine, and the like, and also acid and chemical fumes. Before application, it is in the form of a paste, and is applied in a layer a sixteenth of an inch thick.

The makers suggest that "Permanite" would be useful to effect temporary repairs on petrol pipes and tanks in aeroplanes while in flight.

Among other useful purposes it can be employed in motor vehicles, for making oil-tight joints between cylinder block and crank case, or the joints between the top and bottom halves of the crank case to prevent leakage of oil.

"Permanite" does not expand or contract. It contains no organic matter, and, therefore, does not get decomposed. It is useful for petrol flange joints on pumps, etc., for water joints on gas engines. It resists a temperature of 1,100 degrees C., and over. It lasts indefinitely.

ALUMINIUM WELDING.

The acetylene welding of aluminium has always been a rather unsatisfactory job, chiefly because of the effect of high temperatures on this metal.

A proprietary article which claims to weld aluminium at a very low temperature is, therefore, of considerable interest.

This product is known as So-Luminum, and is handled by the So-Luminum Manufacturing and Engineering Co., Inc., of 1,790, Broadway, New York City, U.S.A.

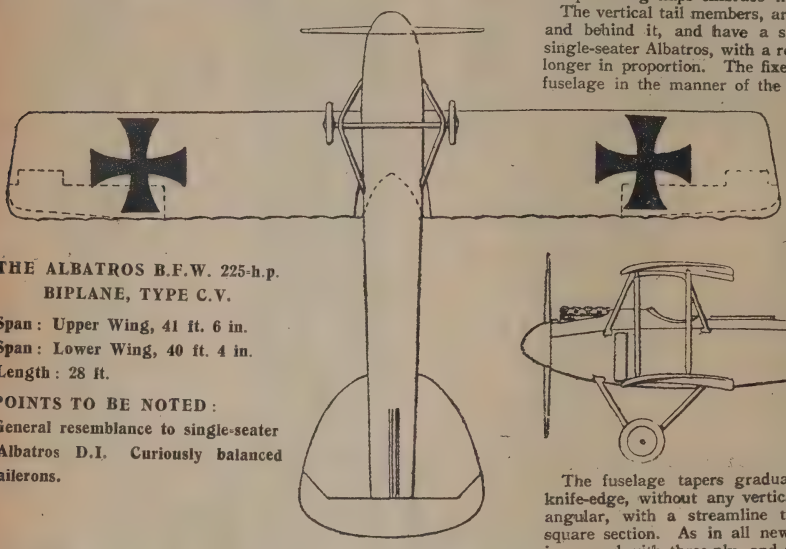
So-Luminum is an alloy cast in sticks, which is used in very much the same way as the metal feed-stick used in the oxy-acetylene welding process. The difference is that an ordinary petrol torch is used, with a proportionately low temperature, and no flux is necessary.

It is claimed by the manufacturers that So-Luminum is the only metal which will satisfactorily solder aluminium, owing to the impossibility of keeping it free from oxidation, and they emphasise the point that the temperature at which a weld is possible is so low that there is no danger of burning, or of distorting the metal in any way.

The method of operation is to clean the job, heat it with a petrol blow-lamp, tin the surfaces to be joined up with So-Luminum, bring them together and re-heat.

This material is used extensively by the U.S. Army and Navy, the International Motor, Packard, Pierce-Arrow, Studebaker, Locomobile, and kindred firms, so that its trial on this side seems warranted.

One user states that he mended a broken crank case with So-Luminum without removing it from the chassis, and without damage to the Babbit metal bearings. Inquiries, mentioning The Aeroplane, will receive prompt attention.



KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

GERMANY'S MODERN AEROPLANES.

THE ALBATROS 225-H.P. TWO-SEATER BIPLANE.

The following description, translated from an article in "L'Aerophile," of June 15th, by M. Jean Lagorgette, is of interest, because it portrays a general purpose aeroplane which is typical of recent German practice.

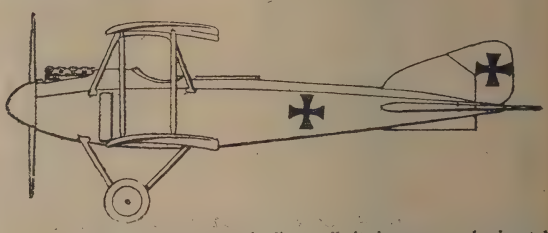
THE ALBATROS B.F.W. 225-h.p. BIPLANE, TYPE C.V.

Span: Upper Wing, 41 ft. 6 in.
Span: Lower Wing, 40 ft. 4 in.
Length: 28 ft.

POINTS TO BE NOTED:
General resemblance to single-seater Albatros D.I. Curiously balanced ailerons.

This machine is in many respects similar to the Albatros single-seater. The machine examined by M. Lagorgette was constructed by the Bayerische Fleugzeug-Werke Gesellschaft, of Munich.

The span of this machine is 12.6 m. (41 ft. 6 in.), span of lower plane, 12 2 m. (40 ft. 4 in.); total length, 8.5 m. (28 ft.); total height, 3.3 m. (10 ft. 9 in.)



The wings are nearly equal in size. They are not staggered, and slightly trapezoidal. There are two pairs of steel tube interplane struts on either side. The ailerons do not project beyond the trailing edge. Instead, they taper gradually towards their outer edges. They are partly balanced, a compensating extension projecting into the wing, in front of the axis of the aileron, as can be seen in the diagram.

The gap between the wings is 1.8 m. (6 ft.)

The wings are constructed of wood in a manner similar to that of Albatros C.III and D.II.

The outline of the horizontal tail-plane is that of a rounded spade. The fixed plane is built in two halves, one on either side of the fuselage, is very thick, and is constructed of timber and covered with three-ply. The elevator is in one piece, and its two compensating flaps embrace the sides of the fixed plane.

The vertical tail members, are placed entirely above the fuselage and behind it, and have a similar appearance to those of the single-seater Albatros, with a rounded upper edge, but it is slightly longer in proportion. The fixed fin is permanently built into the fuselage in the manner of the Perry-Beadle flying-boat.

The fuselage tapers gradually until it becomes a horizontal knife-edge, without any vertical projection. The section is rectangular, with a streamline top. There are four longerons of square section. As in all new German aeroplanes, the fuselage is covered with three-ply, and varnished as in the C.III and other early models.

A revolving pot is attached to the propeller.

The landing carriage is ordinary: one pair of wheels and two steel tube Vs, the wheel base being 2 m. (6 ft. 7 in.)

There is a plough brake and an ordinary tail skid.

The motor is a fixed Benz of 225-h.p., which gives 1,415 r.p.m. It is not geared down. Two large and heavy radiators are placed one on either side of the fuselage. The petrol tank serves as the pilot's seat.

The armament consists of two machine-guns, one fixed on the side of the motor, and firing through the propeller, the other on a rear gun ring. Two bomb-releases are carried in the passenger's cockpit between the floor boards and the bottom of the fuselage.

THE A.E.G. SINGLE-ENGINED BIPLANE, TYPE C.IV.

The Allgemeine Elektrizitäts Gesellschaft, who, before the war, sold electric machinery in France, and is better known in English-speaking countries as the G.E.C., have constructed various large twin-engine aeroplanes with a single fuselage, as well as single-engined, biplanes.

The biplane illustrated, as is the case of all machines built by this firm, is constructed entirely of steel tube autogenously welded, save for the greater part of the ribs and the leading edge of the wings. The lower wings have a span of 12.55 ms. (42 ft.), which is nearly equal to that of the upper wings, 13 ms. (43 ft.), the length of the machine is very small, being only 7.15 ms. (23 ft.).

The wings are set at a slight dihedral, namely, 2.5 degrees, or 125 mms. The centre section of the top plane, which is reminiscent of certain English machines, is supported by a splayed-out cabane, and there are two rows of interplane struts on either side.

The planes are washed out at the tips. Their incidence is 3 degrees for a little more than a third of the span, and 2 degrees near the external struts which diminishes still further towards the extremity of the wings.

The gap is 1.87 ms. at the front struts, and 1.89 ms. at the rear struts, and exceeds in an unusual manner the chord of the planes, which is 1.65.

The dimensions of the steel interplane struts are as follows:—the internal struts, 66 mms. by 31 mms.; the external struts, 62 mms. by 25 mms., and they are mounted at their bases on cones topped by balls.

The wing surface is 39.5 sq. ms. (260 sq. ft.), which includes the ailerons.

The wings are of trapezoidal form, but the ailerons have a peculiar form, their rear edge being very concave, which reminds one somewhat of the ancient Taube.

The wings and ailerons are entirely constructed of tube work, save for the leading edge and the secondary ribs in a manner similar to that which is found in the Rumpler. The main spars are of 40 mms. steel tube with tubular distance pieces, and the principal ribs are also made of flat tube work. In the lower wings there is arranged a pair of small tubes as guides for aileron cables. The trailing edge of the wings is formed by steel wire. There is a certain amount of flexibility in the trailing edge.

The ailerons are attached by three hinges to a false wooden spar, the surface of each being 5 sq. ms.

In each wing two of the cross anti-drift wires are cable and one a piano-wire, attached, as are those in the fuselage, by a link similar to those in the chain of a bicycle to lugs welded to the angles of the tubes. At their point of intersection they are joined in a manner similar to that employed in the bracing between the interplane struts, being in the form of an X à la Rumpler. The fabric is painted green and brown.

The elevator flaps have the appearance of a rounded polygon. The rudder, which is nearly triangular, is preceded by a fixed triangular fin. These controls are not balanced, a rather exceptional feature in a modern German aeroplane.

The fixed tailplane has a surface of 1.8 m. The elevators are 1.32 m. The fixed fin is 0.7 m., and the rudder is 0.63 m.

The angle of incidence is adjustable from 2.4 deg. to 4.55 deg.

The fuselage is constructed entirely of straight steel tubes, the surface thereof being slab-sided, but there is a rounded cowl in front, made of three-ply, with fabric on its sides. The streamline

View of concave aileron.

A.E.G. TWO-SEATER BIPLANE, TYPE C.IV.

Span: Lower Wings, 42 ft.
Span: Upper Wings, 43 ft.
Length: 23 ft.
Engine: 175-h.p. Mercédès.

POINTS TO NOTE.

Splayed-out Cabane Struts.
Rudder extending to bottom of Fuselage.
Concave trailing edge to ailerons.

fairing on top of the fuselage is formed of three-ply placed on arches.

The two engine bearers, which are made of square steel tube, are supported in front each by two oblique tubes, placed one above, the other below.

The fuselage terminates suddenly at the rear with a vertical strut, and is overloaded with tubes and lugs. It is covered with fabric, which laces underneath.

Behind the motor is placed the pilot, who sits over the petrol tank, and behind him is the passenger's seat, which can be slid along a pair of "U"-shaped rails.

The landing carriage does not differ from others, except for its shock obsorbers, which consist of heavy coil springs (6 kgs.), which are attached to three long transverse steel members—an axle of 55 mm. diameter, and a distance piece in front and behind, all of which, together, make a streamline.

The tail skid is massive and well sprung.

The motor is a 6-cylinder Mercédès of 175-h.p.

The propeller is a "Wolf," 2.8 m. diameter and 1.8 m. pitch, constructed of alternate layers of ash and walnut, or walnut and mahogany.

An oblique funnel projecting from the fuselage makes it possible to replenish the petrol tank from the ground, without getting into the machine.

There is a water reservoir in the central section of the upper plane to the left of the axis of the machine. The radiator itself is of honeycomb type.

The exhaust pipes unite in a common vertical cylinder.

The armament consists of two machine-guns, one firing through the propeller, the other being placed in the passenger's cockpit.

There is a bomb-rack in the passenger's cockpit to take four bombs, placed one above the other.

THE HALBERSTADT FIGHTER.

"L'Aerophile" for June 15th also contains a dissertation by M. Jean Lagorgette upon the Halberstadt single-seater fighting biplane, type D.

M. Lagorgette states that the Halberstadt Company, of Halberstadt, modestly call themselves "cherished of the premier aviators of the war," and that their machines seem to be more in vogue on the British front than on the French front, if one can judge from the number which have been destroyed.

The single-seaters have a length of 7.3 metres (25 feet).

The upper plane has a span of 8.7 metres (28 ft.), and slightly larger than the lower plane (7.85 m.). The wings are set at a dihedral angle, are washed out, and are noticeably staggered, the lower wings being staggered 0.45 m., which assists the view ahead.

The wings are not swept back, and are nearly rectangular. The ailerons, which are on the upper planes only, project slightly, and are washed out, rising at the tips, as in other German biplanes. They are hinged on a secondary spar placed behind the rear main spar.

The chord of the wings is 1.56 m.; surface, 24.5 sq. m. (256.5 sq. ft.); gap, 1.3 m. The upper wings are not very distant from the top of the fuselage.

There are two pairs of interplane struts on each side of the fuselage, inclined towards the front. These struts are made of streamline tube, which terminate at their extremities in perforated heads, which are pinned between the walls of a fork joint fixed to the main spars, on which they pivot. In this way, the upper plane, by a movement through a parallelogram may, without the removal of struts, be folded in line with the lower plane, for ease in transport.

This system is all the more advantageous, because there is no necessity for readjustment when re-assembling; to release the cables, which operation is necessary, there is no need to unscrew the strainers, it suffices to unfasten the quick release attachments (similar to those in the L.V.G.), which connect certain cables to the bases of the interplane struts. Those cables, which do not have to be detached, are fixed to a ring contained in the base of the strut (as in the early Albatros).

This base is sloped by a block of wood to give it the inclination necessitated by the stagger of the wings.

The piano-wire cross bracing, which composes the internal strengthening of the wings, is fixed to long wiring plates, bolted to the inner surface of the spars. The main spars are of I section, and the cabane connects the upper pair with the fuselage. The centre section of the wings is covered with three-ply.

The lower spars terminate with a morticed butt, which meshes with a metal tenon built into the fuselage, and to which it is pinned by a bolt and cotter. This system, imitated from certain French machines, now tends to predominate in German aeroplanes, because it is very simple, and can easily be taken down, and is capable of manufacture on a larger scale than the older complicated attachments, specially constructed for each type of machine.

The section of the wing is well curved and very concave, as is common to all German machines even when intended for speed, and they are also very heavy. The trailing edge is rigid.

The control planes are similar to the early Morane, and without fixed surfaces. This absence is even more marked, and allows still more to be seen of the tapering fuselage, as the rudder is higher and more pointed, and stayed by two streamline tubes. It is placed almost entirely above the fuselage, and is not balanced below, as the balanced portion only appears on top. The shape of the balanced elevator is identical with that of the Morane.

Both rudder and elevators are built entirely of tube. The ribs in the elevators have internal "zig-zag" bracing. All the ribs are welded, both to the axle tubes and to the edges.

The fuselage is similar to that of the early Morane; it tapers horizontally backwards, and is of rectangular section.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

THE HALBERSTADT FIGHTER, TYPE D.

Span: Upper Wings, 28 ft.
Span: Lower Wings, 27 ft.
Surface: 256 square ft.
Motor: 120-h.p. Argus.

POINTS TO NOTE.

Morane type control planes, without fixed fins.
External rudder post stays.
Slab-sided fuselage, with rounded top.
Square-cut planes, with projecting ailerons.

It is constructed of wood, with hollow spars, lapped with fabric, with cross struts so arranged that the longerons are not pierced, and the vertical and horizontal distance pieces being held in place by simple tin clips which encircle the longerons, but are bolted only to the distance pieces. Lugs extending from these clips serve as anchorages for the piano-wire bracing.

The cockpit is nearly central from front to back, and the upper longerons are nearly rectilinear. The fairing on top of the fuselage is in the form of a tapering bomb, which breaks off about halfway along the tail. It is formed of half hoops and laths.

The centre part of the fuselage is covered with fabric. The pilot is accommodated on a three-ply seat placed above the petrol tank.

The landing carriage is of usual type, a pair of streamline tube "Vs" united at their extremities by knee pieces.

The rear chassis strut is fixed underneath the rear lower main spar, where it unites with the fuselage longeron.

The tail skid of ash, pivots on a steel tube tripod, its front part being attached with a rubber cable, and the rear portion is shod with a metallic shoe.

The motor is usually a 120-h.p. Argus (a stationary vertical motor, with six cylinders linked by their water-jackets). The valves are placed on top of the cylinders, in line, and are operated, not by a camshaft, as on the Mercédès, but as on the Benz, by a vertical push-rod to each valve, placed on the left side of the engine.

The air inlet passes through a rectangular chamber placed underneath the carburettor.

The controls are of Fokker type. There is a vertical lever with two hand grips. A locking device makes it possible to stop the longitudinal action of the control lever, so that the pilot can leave both his hands free when he wishes to operate his guns.

The rudder-bar is fitted with stops to prevent the pilot's feet from slipping. All control wires are duplicated.

The armament consists of two machine-guns, firing through the propeller (until recently, there was a single Maxim). The action of these guns is made to synchronise with the rotation of the propeller, with the usual cam gear. Space is provided for 1,300 rounds.

THE ADVISORY COMMITTEE'S REPORT.

The report of the Advisory Committee for Aeronautics, of which Lord Rayleigh is president, was published last week. As usual, it is chiefly concerned with the glorification of the National Physical Laboratory. The following passages are of interest:—

The experimental investigations carried out under the control of the Advisory Committee for Aeronautics into the many problems affecting the development of aircraft have been continued and extended during the past year. Owing to the growth of the work of the Committee in certain directions, Sub-committees have been formed to advise in regard to special matters.

An Internal Combustion Engine Sub-committee has been appointed under the chairmanship of Dr. Dugald Clerk; Mr. Fowler is acting as chairman of a Light Alloys Sub-committee. Other Sub-committees have been constituted from time to time to investigate particular problems.

[One may supplement this statement by the remark that Dr. Clerk and Mr. Fowler are both practical men of proved merit, and their work on this Sub-committee is known to be of high value, as compared with much of the other operations of the Advisory Committee. It would be an excellent improvement if new designs for aero-engines were submitted to this Sub-committee instead of being turned down or boomed off by understrappers in the Air Board.—Ed.]

Many changes and developments in the design and construction of aircraft have taken place as the result of the continued and varied experience gained from their use in warfare under modern conditions. An increasing number of special problems is thus constantly presented for investigation, and these have very closely occupied throughout the year the attention of the staffs engaged in experimental work both at the National Physical Laboratory and at the Royal Aircraft Factory.

In addition to aerodynamical research, much attention has been given to questions relating to engines, materials of construction, strength of construction and design, instruments and accessories, as well as to methods of attack from aircraft and other matters.

[It may be well to point out that though the credit for all the discoveries in the directions indicated will doubtless be appropriated by Government officials, the great majority of the successful ideas, especially as regards engines, instruments, accessories, and methods of attack, come from active-service pilots and from the Aircraft Industry.—Ed.]

Stability and Kindred Questions.

With regard to aerodynamics, the experiments have been of very varied character, and have included tests of models of probably all types of aircraft at present employed. A large part of the work has arisen from specific inquiries proceeding from the Service departments, but progress has been made with some investigations of a more general character. Experiments have been carried out relative to the resistance of airship shapes, and further observations on the distribution of pressure in such cases have been made.

The investigation into the stability of the aeroplane has been continued. A number of special cases have been examined, and results of importance have been reached.

The theory of airship stability has also been investigated. Research into the nature of the flow of fluids round obstacles has been continued. Investigations relating to airscrews have been

carried out, with a view to increasing the accuracy of prediction of performance, and thus facilitating the design of airscrews for special purposes. Tests on screws to be used as windmills for the production of power have also been made.

[This last is particularly interesting in view of the N.P.L's. refusal to reply intelligently to Mr. G. W. Goodchild's letters on the subject. Reference should be made to the correspondence between Mr. Goodchild and the N.P.L., which was published in this paper recently.—Ed.]

The work has included a complete series of tests on more than one complete aeroplane model. The information thus derived is of considerable importance for practical purposes in aeroplane design.

CONSTRUCTIONAL STRENGTHS

Questions relating to strength of construction have been investigated, and some general conclusions have been reached tending to simplification of strength calculations. The basis to be adopted in design to secure adequate strength in high speed machines, with the power of rapid manœuvring essential in aerial fighting, is a matter demanding the most careful consideration.

To secure the highest possible speed it is necessary to keep down the weight to a minimum, and the best compromise between these two opposed conditions does not admit of precise determination. This question has received attention, and the manner in which strength varies with increase of dimensions has also been made the subject of investigation. Cases in which vibration has been set up have been examined, and calculations relating to the strength of the body structures have been made.

[Yet, curiously enough, no official person seems to have realised yet that a true monocoque body is the best of all body structures.—Ed.]

The use of light alloys in the construction of aircraft and aircraft engines is becoming of rapidly increasing importance, and improvements in the production of light alloys will have great effect on future development. The investigations relating to light alloys, which have been in progress for many years at the National Physical Laboratory, have been continued, and results of special interest have been achieved during the past year.

[Thanks to the efforts of commercial metallurgists and not to the N.P.L.—Ed.]

Suggestions have been made to the Air Board by the Committee which may, it is hoped, help to secure the best conditions in manufacture for the development of such alloys. The formation of the Light Alloys Sub-committee will be of great assistance in co-ordinating the work on light alloys which is being done in various quarters, and in collecting the information resulting from experimental investigation and manufacturing experience.

Experimental work has been carried out for the Sub-committee at the Royal Aircraft Factory, the University of Birmingham, the National Physical Laboratory, and elsewhere, and arrangements have been made for placing the information obtained at the disposal of manufacturers.

[One hopes that the information will actually be placed at the disposal of manufacturers and that clever young officials will not store up tit-bits of information for use to their own advantage when opportunity arises.—Ed.]

ACCESSORIES BEFORE THE FACT.

A number of special questions have arisen for investigation in relation to airship and aeroplane fabrics. A large amount of attention has been given to materials for use as dopes, varnishes, etc., and the Laboratory has collaborated with the Military Air Department in an investigation into the behaviour of fabrics, dopes, and protective coatings under the conditions of tropical exposure. The results of exposure to ultra-violet radiation have been studied in relation to the effect of sunlight, and conclusions of importance have been reached.

[Meantime, production has been hindered, because the microscope merchants have hung up perfectly good material during their pleasure. Ordinary practical experience of fabric and dope, and varnish and glue counts for little alongside the pseudo-science of the official mind.—Ed.]

SPECIAL QUESTIONS.

Tests on models of seaplane floats in the William Froude National Tank have been continued and extended. The provision made last year for an increase in the staff available for carrying out this work has enabled more rapid advance to be made, and a number of important questions have received attention. The methods employed have been improved and elaborated, and new apparatus has been designed whereby additional measurements can be obtained and further information secured relative to special conditions arising in practice.

[If some of these able-bodied young men were to take a course of experimental work in motor-tanks at the front they would probably confer greater benefits on their native land, and might even enrich the land in which they would probably remain.—Ed.]

As usual, a large number of special questions have been referred to the Committee for advice or investigation. The experiments relating to bombs have been continued, and valuable communications relative to the flight of bombs have been received from the Air Department of the Admiralty and from the Central Flying School.

Questions relating to the attack of aircraft from aircraft have been examined.

[One can well believe that the Advisory Committee has been handling the question, if the effects of recent attacks on German air raiders may be taken as evidence. The lamentable lack of results distinctly suggests that the Military Authorities have been taking the Committee's Advice, much as the present lack of aeroplanes and engines is the result of taking the Committee's Advice in the past.—Ed.]

Problems in connection with the aeroplane compass have been further considered. Other instruments and apparatus for use on aircraft have been investigated.

As previously, a number of inquiries have been received from the Board of Invention and Research and the Munitions Inventions Department, and investigations have been carried out at their request at the National Physical Laboratory and at the Royal Aircraft Factory. A number of communications have been received during the year relating to experimental work carried out by the R.N.A.S., and by the Testing Squadron of the Royal Flying Corps. Many of these have been of great interest and value, and of much assistance in the application of the results obtained from the model experiments and in the estimation of aeroplane performance.

[One would like to make a substantial bet that the N.P.L. has learnt many times as much from the Test Squadron R.F.C. than the Test Squadron has learnt from the N.P.L.—Ed.]

EXPERIMENTS AT THE ROYAL AIRCRAFT FACTORY.

Much research has been made into various methods for improving the output and the reliability of aeroplane engines. A large number of radiators of various types have been tested, and an efficient type has been standardised. Great progress has been made in the development of the air-cooled engine.

[Has the official development approached the A.B.C. effort yet?—Ed.]

Work has been done on the compensation of carburettors for variation of air density and a device for improving the performance of engines at great heights has been tested on several engines.

The measurement of the resistance of aeroplanes in flight has been continued with the object of confirming the model experiments and an instrument for measuring the resistance directly has been developed.

Measurements have also been made of the disturbance of the air behind a propeller to obtain data which are required in the design of new machines.

[One commends to attention the study of the front end of German machines with a view to getting better efficiency from propellers.—Ed.]

The behaviour of various types of magnetic compass in an aeroplane in flight has been investigated.

Two new types of bombsight have been developed, and are now being tested.

The improvement of the standard aeroplane instruments has been continued, and a number of special instruments have been devised for use in connection with full scale experiments on aeroplanes.

The means of communication between pilot and observer have been improved.

Experimental work in meteorology has been mainly in connection with the inquiry into the location of distant thunderstorms and the tracing of their progress across the map by means of a properly organised system of observations at various stations.

[Has anyone thought of employing our anti-aircraft observation posts on this job? There seems to be a distinct possibility in this direction.—Ed.]

AIRCRAFT PARTS.

The Albany Forge, Ltd., which is in association with W. E. Whiteside and J. Caslake, Ltd., whose works are at 45, Goldhawk Road, Shepherd's Bush, W., has commenced the manufacture of aircraft parts. This department is under the control of Mr. W. Lovelace Osborne, who has had considerable experience in aircraft work.

The firm is open to undertake further contracts for the manufacture of all kinds of component parts, particularly in sheet-metal-work and welding.

A REINFORCEMENT.

It is announced that the Board of J. Samuel White and Co., Ltd., of East Cowes, I.W., has been augmented by the appointment of Sir James B. Marshall, K.C.B., as Deputy-Chairman.

Sir James Marshall's appointment cannot fail to increase the utility and prosperity of this extremely strong and well-established firm. Mr. A. J. Carnt, brother of the late Chairman, is now Chairman of the Board.

Triplex Safety Glass.

A schoolgirl who was told to write an essay upon "Pins" evolved the following:—

"*Pins have saved thousands of lives.*"

Asked for an elucidation of this extraordinary brain-wave, she rejoined:—"By people not swallering 'em"!

On this analogy it might be averred that plain glass has saved thousands of lives—by people not using it on motor-cars and aeroplanes. Unfortunately, a great many people still go on using it, at no small risk to themselves—a risk which is expressed in practical shape by the fact that insurance companies will quote a lower premium to the car-owner who uses Triplex Safety Glass than to those who have taken no such salutary precaution.

As a matter of fact, Triplex Safety Glass has proved its value in such unmistakable fashion that to avoid its use until an accident forces its necessity in painful fashion is only one degree less fatuous than to refuse to take out an insurance policy until the first mishap has occurred.

Quite an interesting collection of trophies, which is almost daily being augmented, may be seen at the show-rooms of the Triplex Safety Glass Co., 1, Albemarle Street, W., in the shape of various goggles and gun-shields that have saved the eyes and perhaps the lives of aeroplane pilots. It may be doubted if anything more convincing in the way of ocular demonstration could be imagined than a lens cracked by a shrapnel bullet which would assuredly have pierced a piece of plain glass. Small wonder is it, therefore, that Triplex goggles are officially served out as a necessary item of a pilot's equipment. As for screens, they too are officially regarded as indispensable, and, so far from weight being a barrier, one may even see a fitting of this kind, R.A.F. pattern, which does not exceed six ounces.

The latest development, by the way, in the use of Triplex glass opens up new possibilities. Everyone knows the value of tinted goggles for eye-resting purposes; but what everyone does not know is that the number of tints which can be imparted to plain glass is strictly limited. On the other hand, the xylonite insertion which is an essential feature of the Triplex method can be invested with any colour, and lenses and screens are now available in tints that are more grateful in actual use than those which are more ordinarily obtainable.

Another recent use of Triplex glass is in connection with hand mirrors, which are therefore unbreakable. A benefit of a practical kind is not only thus conferred, but the feelings are thereby spared of those who regard the cracking of a looking-glass with superstitious fears.

As a matter of fact, the purposes to which Triplex Safety Glass may be applied are wellnigh unlimited; it can and may eventually supersede the use of the plain article in every direction, save only where a flat surface is not employed. This one limitation, of course, is due to the manufacturing process. A thin sheet of xylonite is inserted between two sheets of glass and treated with several coats of adhesive mixture, hydraulic pressure being then applied until the product is all but homogeneous; but a plane surface is obviously essential.

Undoubtedly a number of new uses for Triplex glass will be found after the war, but even now they are numerous, and range from goggles to 8-ply panels, 5 inches thick, for armoured cars, and 5-ply panels for ship look-outs. One of the 8-ply panels, by the way, was officially tested with a Mauser rifle at 25 yards, using German ammunition, and was found proof both normally and reverse. The bullet, indeed, was simply absorbed, as it were, by the glass, being reduced to fine particles. Even an ordinary motor-car screen, hit by eight shrapnel bullets, has been known to stop seven, while the eighth only just got through.

Mr. Reginald G. M. Delpech.

For burglar-proof purposes, moreover, Triplex Safety Glass is invaluable, as a burglar cannot get through a glass door by the ordinary method of using a diamond cutter. Even if he could cut a Triplex pane on both sides he would still be unable to break it, while in reality he would only have access to it from one side.

Where delicate instruments, too, are concerned, the use of Triplex glass confers material advantages, as the indicators can be printed on the xylonite and thus be under protection.

The story of how Triplex Safety Glass came to be manufactured in this country is not without interest. Invented by a Frenchman, M. Benedictus, it was introduced to Mr. Reginald G. M. Delpech one morning when, as it happened, he had met with a serious accident only the night before. The taxicab in which he was being driven was charged by a motor-car, head on, with the result that he had numerous cuts on the head and an ear nearly torn off. Mr. Delpech realised the possibilities of the invention at once, and straightway went over to Paris to secure the British and Colonial rights, since when the business which he established for the manufacture of Triplex Safety Glass has gone ahead in remarkable and constantly increasing fashion.

ON PRACTICAL COSTING.

A small handbook is about to be published by Mr. Arthur H. Gledhill, A.M.I.M.E., of the Gledhill-Brook Time Recorders, Ltd., entitled "Practical Costing."

An advance copy of this handbook makes interesting reading, setting forth, as it does, a system for the complete control of a works output by the use of the Gledhill-Brook card and time clock recording scheme.

The author points out that a costing system should point out four things, namely:—

(1) Reveal what profits and losses have been made in each department, thereby showing their relative efficiency.
(2) Form a basis for estimating.
(3) Form a manufacturing profit and loss account.
(4) Show losses on occupied floor space, and idle machinery.

The following important problems are dealt with, and a solution is given to their satisfactory accomplishment.

(1) Routine necessary to start a job.
(2) Time records.
(3) General labour costs.
(4) Hourly rates (labour).
(5) Stores and Materials.
(6) Overhead manufacturing expenses.
(7) Selling expenses.
(8) Final summaries of costs.
(9) Balancing cost accounts with commercial accounts.
(10) Weekly departmental account.
(11) Manufacturing in multiples of 60.
(12) Costs and estimates.
(13) Bonus for increased output.

Such a very comprehensive work, written by an expert on his subject, should be in the hands of everyone concerned with manufacturing.

The price of the handbook will be 3s., and it will be ready for sale in a few days.

Applications should be addressed to the Gledhill-Brook Time Recorders, Limited, 26, Victoria Street, Westminster, S.W.

MARKET REPORTS.

26/7/17.

The object of these reports, as the majority of readers know, is to record fluctuations of the Market Prices of Aircraft Materials, the causes influencing the prices, and as far as possible to record expected fluctuations. It is therefore unnecessary to plead pardon for commenting upon the most recent and very drastic regulations issued by the Air Board for controlling Aircraft Materials.

The regulations issued by the Director of Aeronautical Supplies, dated July 19th, are as follows :—

The following regulations regarding sub-contracting will be included as a condition of any future contracts. As regards current contracts you will adopt this procedure for any further sub-contracts you may propose to place.

Sub-contracts.—Sub-contracts shall be placed only with the written permission of :—

(a) The Controller of Aeronautical Supplies (S.M.A.) for

Irons	A.G.S. Parts
Steels	R.A.F. Wires
Non-ferrous Metals.	Stampings
Crankshafts	Pressings
Cables	Tubes (other than Steel)
Wires	Timber
Dope	Chemicals
Fabric	Steel Tubing
Canvas	

Advice as to the most suitable firms from which to order material for the purpose of this contract may be obtained from the Controller, application being marked (S.M.A.)

(b) The Director of Inspection for :—

Manufactured Details generally, other than those excepted in (a) above.

(c) Application for permission to sub-contract complete Units such as Planes, Tail Units, Fuselages, etc., must be made to The Director of Aeronautical Contracts.

All such applications must show specifically what items and what quantities it is proposed to sub-contract, with the full address of the firms proposed.

The above regulations are very sweeping, and cannot be considered a wise step, if acceleration and colossal increase of output is the chief ambition of the Air Board officials.

Manufacturers have already suffered very greatly by a similar control affecting Machine Tools. No doubt some kind of control was necessary, but at present aircraft firms, amongst others, must apply to the Ministry of Munitions, Area Clearing House Board, for permission to buy any machines they require, the application forms being made in triplicate; if the Area Clearing House Board approve, the application is sent to the Central Clearing House Board; if the latter endorse the decision of the Area Clearing House Board it is sent to the Machine Tool Department for the necessary release number to be given. Cases are known where aircraft firms have had to wait one, two and three months before they could procure machines which have been lying in London warehouses.

Even when the necessary release number has been procured and the order placed, the suppliers must then fill up a form and send it to the Machine Tool Department for permission to execute the order. Is it any wonder that applications are lost, and manufacturers are compelled to patiently wait weeks and weeks before they can order? What guarantee have they that there will not be the same muddle and delay in obtaining approval to place orders for materials?

One interprets the regulations to mean that aircraft firms must submit all orders for any materials of construction whatever to the various directors to whom reference has been made. There are various reasons why one cannot guarantee the interpretation to be correct. For instance, manufactured details in Clause (b) cannot refer to the units in Clause (c), viz., tail planes, fuselages, etc.

Are manufacturers to understand that they refer to manufactured materials, such as switches, wood screws, copper tacks, varnishes, tanks, etc., etc? and, if so, why is the Controller of Aeronautical Supplies deputed to deal with dope and not varnishes? And is it intended that petrol, oil and gravity tanks are in the etc. of Clause (c), or the manufactured details of Clause (b)? And why not give a complete schedule of A.G.S. parts referred to in Clause (a), so that manufacturers would know if this includes such minor parts as split pins and thimbles?

Then again, seeing that R.A.F. wires and cables are on the A.G.S. sheets, and are shown separately in Clause (a), why not show everything in detail and make the schedule complete? One more example will suffice. Seeing that R.A.F. wires are shown separately, and swaged rods are not detailed, one presumes that the Controller does not wish contractors to submit orders for the latter for his approval, and if this assumption is correct, why should R.A.F. wires be included and swaged rods be excluded?

Aircraft firms have already had a little experience of Air Board control of materials.

Fabric.

In January Fabric became a controlled article. In The Aeroplane of March 7th, it was stated that all demands for Fabric must be sent to Capt. Stanley Clark, D.A.E., 4 S3, Room 506, Hotel Cecil. Perhaps some enlightened official will sooner or later inform manufacturers if fabric has been included in Clause (a) in error—firms not at present being allowed to negotiate direct with weavers—or if the original instructions are cancelled.

Now we proceed. One understands that the Fabric Controller considerably increased the number of weavers turning out aircraft Fabric, but did not, apparently, increase the number of bleachers, consequently the weavers turned out more Fabric than the bleachers could deal with, and stagnation resulted.

After six months the price was fixed (?) but, again, there appears to be a muddle. The weavers state emphatically that the prices are as follows :—

36 in wide	2s. 5½d.
38 in. wide	2s. 7d.
42 in. wide	2s. 10½d.
54 in. wide	3s. 8½d.

On the other hand, the aircraft firms have been informed by the Air Board that the price will be 2s. 8d., 36 in. wide. There is no reason to doubt the information given, and this gives one a glaring example of control. A fair contention is that these blunders rile manufacturers of materials, and are not conducive to procuring maximum exertion from them. Furthermore, the abnormal advance in the price of 17C Fabric after the Air Board took control is very significant.

Timber.

Timber is another item of construction which has been controlled for a short time with disastrous results. Briefly summarised they are as follows :—

(1) Timber merchants never had such low stocks of Silver Spruce, Walnut and Mahogany, and the wood imported by the Government is reported to be very bad. The question of supplies has now become most critical.

(2) The prices have advanced more than 50 per cent., primarily due to an ever-increasing demand, and a corresponding decrease in shipments, due to inefficient control.

The various queries raised at the beginning of this report show conclusively the inefficiency of the staff deputed to control the materials for our most vital industry, and one can only hope that upon further consideration the Air Board will allow manufacturers to have a free hand in procuring materials. One is firmly convinced that suppliers are unanimous in their desire to deal direct with business men who have grown with the Aircraft Industry and have practical first-hand knowledge of their requirements.

Prices given below are for quantities on usual terms.

COPPER.—The situation in America is still very grave; some smelters are reported to be shut down, and the effect upon output is bound to be serious. As foreshadowed last week, there has been an all-round reduction of £5, and it would not be surprising to see a still further gradual decline :—

Copper Ingot (Standard)	£125 per ton cash.
Copper Sheets	£165 per ton cash.
Copper Tubes D.S.	20½d. per lb.
Brass Sheets 24 G.	16½d. per lb.
Brass Tubes S.D.	17d. per lb

TIN.—It is very significant that America is not calling for any Tin for forward delivery; notwithstanding this, there is still a fair demand here even with a high erratic market prevailing.

Last Month	£242 15s.
Last Year's Highest	£205 os.

LEAD.—There has been no alteration in the official prices, and supplies are fairly good, although the position in Spain is still very unsatisfactory.

Official prices for Soft Foreign Pig, £30 10s. to £29 10s.

STEEL.—Supplies of Aircraft Steels do not appear to be making an abnormal increase, and prices still continue firm. The regulations for the Control of Steel given in last week's report are, as usual, liable to various interpretations, and any doubtful points should be taken up with the Controller of Aeronautical Supplies.

Current Average Prices.

R.A.F. 3B Steel Black or Blue Reeled, 36s. to 40s. per cwt. Basis.

R.A.F. 1E Steel Black or Blue Reeled, 78s. to 80s. per cwt. Basis.

R.A.F. 9A Sheet Steel, 30s. to 32s. per cwt.

ALUMINIUM.—The general position remains unaltered.

Ingot	£225 per ton.....
Re-melted	£210 per ton.....

TIMBER.—The shortage of supplies is becoming extremely

ESTABLISHED 1830

acute, and merchants are anxiously waiting to see what steps the Government intend taking to ensure that there will be adequate supplies of Aircraft Timbers available next Spring. One presumes they are not overlooking the fact that to enable the Factories to quadruple the output of Aeroplanes, it will be necessary to more than quadruple the shipments of Wood. The prices of Spruce continue very firm. Walnut is strong, and Mahogany shows a tendency to advance.

Current Average Prices.

Silver Spruce	17s. 6d. c.f.
English Ash	13s. 6d. to 15s. c.f.
Walnut	2s. 3d. to 2s. 6d. s.f.
Mahogany	2s. 2d. to 2s. 4d. s.f.

Prices are for selection and delivery.

FABRIC.—As stated in the first part of this report, there appears to have been a muddle made over the prices fixed for Fabric. The following official prices are quoted for the weavers, and we think they can be accepted as correct:—

17C Linen Fabric.

36 in. wide	2s. 5½d. per yard.
38 in. wide	2s. 7d. per yard.
42 in. wide	2s. 10½d. per yard.
54 in. wide	3s. 8½d. per yard.

Spaced Linen Fabric, 37½ in. wide, 1s. 7⅞d. per yard.

THE PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by The Aeroplane from the current Official Patents Records.

Patent Applications.

Bairstow, W. Wiring into and maintaining in position tail units, etc., of aircraft. No. 10285. July 17th.

Birault, C. Sighting instrument for aviation. No. 10414. July 19th.

Bruce, R. A. Fastenings of detachable or foldable aeroplane wings. No. 10420. July 19th.

Calthrop, E. R. Bomb-dropping devices. No. 10473. July 20th.

Calthrop, E. R. Destroying aerial craft. No. 10474. July 20th.

Dickinson, F. W. Aeroplanes. No. 10343. July 18th.

Motte, R. C. Screw propellers for aircraft, etc. No. 10347. July 18th.

Pashley, C. L. Flexible connections, control wires, etc., for aircraft, etc. No. 10412. July 19th.

Robson, J. Aeroplanes. No. 10508. July 21st.

Shortt, A. G. Method of operating automatic valves of balloons and airships by circumferential tension of the envelope. No. 10299. July 17th.

Sutton, G. W. Flying machines. No. 10288. July 17th.

Wells, R. F. Aeroplanes, etc. No. 10367. July 18th.

Abridgments of Recently Published Specifications.

106,049. Aerial Warfare. Steinmetz, J. A., 10, North Fourth Street, Philadelphia, Pennsylvania, U.S.A.

Consists in luring enemy aircraft over illuminated imitation buildings or other works on land or sea and then destroying them by gunfire. As shown, an imitation building A provided with a searchlight B is surrounded by guns D. The searchlight is arranged to illuminate the building when not used for spotting the enemy aircraft C. The guns are normally directed toward various points of the beam of light, and the projectiles are timed to explode at various points E within that field. The searchlight and the guns may, however, also be capable of having their directions changed; and the projectiles may be timed to explode at other points E^1.

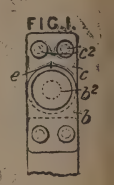

FIG. 1.

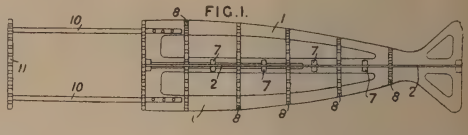
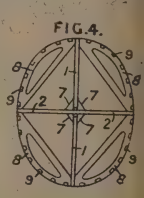
106,441. Aeronautics. Castle, J. P., c/o. Wellby, H., The Lea, Esher, Surrey.



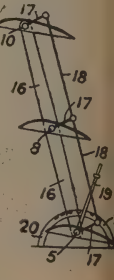
Planes, Arrangement and Construction of.—To equalise the stress in duplicated tension wires on aeroplanes and other aircraft, the wires are connected to a member c pivotally mounted on another similar member or members b secured to the machine. The wires are connected through the usual turn-buckles to the pins c^2 disposed one each side of the joint b^2. Arrow-head indication marks e are provided on the members which, when in alignment, indicate that the stresses in the wires are equalised.

FIG. 1.



106,485. Aeronautics. Vedrines, J., 33, Rue Notre-Dame de Lorette, Paris, and Astoux, L. L., 33, Avenue des Moulineaux, Issy, Seine, France. Convention date, May 16th, 1916. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act.

FIG. 1.



Framework.—An aeroplane fuselage has a rear part built around two-ply wood frames crossed at a right-angle or other angle, and a front part formed of four longitudinal members braced together, bent, and secured to the vertical frame of the rear part. Fig. 1 shows two open frames 1 and 2 each slotted longitudinally to enable a crossed joint to be formed which is strengthened by brackets 7. Frames 8, Fig. 4, also of ply wood, and conforming to the outer shape of the fuselage, are secured to the frames 1, 2 and are notched at 9 to receive flexible longitudinal battens to support the fabric covering. The frames 2, 1 are integral with the fixed stabilising-plane and vertical fin respectively. The front part consists of four members 16 bent at their rear ends and secured to the frame 1. Ply wood frames 11 similar to the frames 8 are secured to the members 10. Fabric may be used between adjacent layers of wood in the various frames.

FIG. 4.

106,486. Aeronautics. Vedrines, J., 33, Rue Notre-Dame de Lorette, Paris, and Astoux, L. L., 35, Avenue des Moulineaux, Issy, Seine, France. Convention date, May 1st, 1916. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act.

FIG. 1.

Steering.—The planes of a multiplane are pivoted about their centres of pressure and are connected by a parallelogram linkage to enable their angles of incidence to be adjusted simultaneously. Fig. 1 shows a triplane in which the planes are carried by tubes 5, 8, 10 mounted in bearings on the fuselage and on bars supported by the fuselage. The outer ends of the tubes turn in bearings carried by members 16 braced to the fuselage. Each tube has a pair of arms 17, the three arms on each side being connected together by rods 18. The lowest tube 5 is turned by a lever 19 working over a quadrant 20.

106,487. Aeronautics. Besson, M. M. E., 23, Boulevard de la Saussage, Neuilly s/Seine, France. Convention date, May 3rd, 1916. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act.

Aerial Machines without Aerostats; Planes, arrangement of; Steering.—An aeroplane or hydro-aeroplane comprising several planes with different angles of incidence, has one of its supporting planes set at the same angle of incidence as the tail plane so as to have zero lift in normal flight but capable of assisting the machine when rising. Fig. 1 shows a triplane of which the planes diminish in incidence upwards, the top plane c^1 having the same incidence as the tail plane e. The centre plane c^2 is larger than the other two and has ailerons c^{20}. The plane e is at approximately the same level as the plane c^3 and is braced to the hull a, a rudder post f, and to the central struts of the planes. The empennage also is braced to the planes by

pairs of direct and crossed wires *k*, *l*, Fig. 3. The forward part of the rudder *g* works in a recess e^1 in the tail plane *e*. The wings fold as described in Specification 106,818 and the operating-wires for the ailerons are led over pulleys *j* beneath the plane c^2 which can accommodate themselves to changes in direction of the wires. The elevator is operated by wires connected to quadrants *i* on a hand-lever.

Hydroplane Vessels.—The hull is shaped at the rear to act as a breakwater and the stem has surfaces at the sides to act as planes.

ANOTHER SPORTS MEETING.

On Saturday, July 21st, a sports meeting was organised by the Arrol-Johnston Cadet Corps in aid of local war funds, and was held in the recreation grounds of Dumfries Academy at Nunholm. Though primarily in the nature of an athletic gathering, the order of the day included also a spectacular feature in the form of a fancy dress and cycle parade through the town prior to the opening of the sports programme.

The sports meeting included a tug-of-war, flat and hurdle races, sack and three-legged races, boxing, tilting the bucket, and other tests of strength and skill, and both sexes competed with enthusiasm.

At the close of the sports, Mrs. Pullinger, wife of Mr. T. C. Pullinger, managing director of the Arrol-Johnston Works, presented the prizes to the winning competitors.

The prize list was as follows :—

100 Yards (Cadets, under 16).—1, Kerr; 2, M'Naught; 3, Smith.

100 Yards (Cadets, over 16).—1, Matthews; 2, Paton; 3, Bryden.

100 Yards (open).—Fulton.

220 Yards Hurdle Race.—1, Grant; 2, Kerr; 3, Smith.

Sack Race.—1, Heron; 2, Trotter; 3, Smith.

Odd Boot Race.—1, Raffel; 2, Thompson; 3, Bell.

Tilting the Bucket.—1, Marchbank and Trotter; 2, Halliday and Lawson.

Half-Mile.—1, Raffel; 2, Grant.

Tug-of-War (men) —Plant No. 1 beat Plant No. 2.

Tug-of-War (ladies).—Misses Halliday, Gordon, Steel, Kennedy, Whitelaw, Crampton, Lawson, Geddes.

100 Yards Girls' Handicap.—Miss Taylor.

Cycle Parade (men).—Mr. Holloway as "Harry Tate." Ladies —Miss Thomson as Indian Squaw.

Medals for Shooting Competition.—1, Piper Edgar; 2, Sergt. Wishart; 3, Second-Lieutenant Kirkpatrick; 4, Bugler Cruickshanks.

The whole function was an unqualified success, as was organised in a businesslike way, which reflects the high standard of the organisation at the Arrol-Johnston Works.

A WORKER'S VIEW.

By an Aircraftsman.

It being universally admitted that our great need is for an increase in the number of aeroplanes at once, as a worker in the shops may I put before you reasons which, in my opinion, are keeping output low?

The Need for Organisation.

Many preventable delays occur through men waiting for parts while assembling. The present way is to wait until workmen want the particular parts and then send to stores for them. If they are not in stores the workman must get on with something else, and the half-finished work hangs about in his way or he nurses his job till the said parts turn up.

Many hours are wasted thus, and the want of system gives the workshy his chance and disgusts the industrious worker. How long would this be tolerated in competitive work?

Surely the sensible way is to make out a complete list with the number of parts required when each order is received from the office, and have these ready before the job is given out to the workmen. No doubt a great number of these delays are due to the inexperience or laxity of foremen and charge-hands, who fail to realise that one of their chief duties is to look ahead and have the material to hand when wanted. I do not refer to experimental machines, but to those more or less standardised.

Time Charges.

Again, the time taken over each job in some factories is not checked at all and in others very indifferently done. I submit that a voucher should be filled in for each job, and the workmen should be asked to sign this at the completion of his job. This would find out the efficient worker and also the loafer, who lives on his fellows' exertions, and would reveal astonishing differences in times taken on similar jobs.

As at present arranged in some shops, the times are filled in by charge-hands and the workmen do not know what work they are credited with. This causes a deal of mistrust and dissatisfaction.

Women's Work.

To take the question of women's labour, where women are being introduced to assist in work usually done by men, I submit the best way is for one woman to be put to help a skilled man, who would be responsible for the job, and who would arrange for her to do the easier work and tell her the simplest way to go about it.

The experienced man naturally goes the easiest way to work, and this is, as a rule, the quickest. The novice will work twice as hard with less result. It is of no use to put women to try and produce the finished article as is sometimes tried, or to leave them to rub along at their own sweet will.

The methods in vogue now in some shops only produce indignation among the men at the waste of time and money, and causes vexation and loss of all interest in the work on the part of the women themselves. A deal of the work prepared by the women is done again by the man who values the appearance of his work when completed.

Shop Agitation.

Again, a lot of time is lost in discussing grievances. The shop agitator (often a charge-hand), whose chief aim is to advance his pet views and theories, seizes on any grievance to go the round of the shop and stir up trouble, and naturally the work suffers.

Say a lazy or incompetent man is dismissed. The men only get one side of the dispute. Indignation meetings are called in meal-times and the shop gets full of argument and discussions, and aeroplanes become a secondary consideration.

Unionism.

A newcomer into the shops is tackled as to his membership or not of a trade union. If not a member he is fed with argument till he joins to get peace. Once in the fold, he must do as he is told, down tools when bidden, and otherwise loses his independence.

The genuine worker sees money being wasted in the ways I have tried to explain and naturally thinks he may as well have some of it as wages. It must be remembered that the skilled men's wages in the aircraft works are not what they should be, and men are often obliged to draw on their pre-war savings to keep things going. Many are earning no more than before the war. The workers are a mixture from various trades, some highly paid, some lower, and the rate of wages started at the lowest.

If the management of these factories would arrange to receive suggestions direct from their employees, I think good results would follow. This is done in some works, I believe. Workmen do not care to make suggestions to foremen, etc., and lose any credit due to them if the suggestions are adopted.

A CHANGE OF NAME.

It should be noted that the Navarro Aircraft Co., Ltd., of Park Street, Burton-on-Trent, has been registered as the Burton Aircraft and Manufacturing Co., Ltd., and will in future be known as such. The company will carry on the same business upon the same premises, which will be extended in all departments.

(*Continued from page* 300).

Several tons of bombs were dropped with good results, numerous explosions being caused.

All machines and pilots returned safely.

THE CASUALTY LIST.

Reported July 25th.

ACCIDENTALLY DROWNED.—Morrison, Flt. Comdr. L. D., R.N. Hervey, Lt. W. B., R.N.V.R.

SLIGHTLY WOUNDED.—Taylor, Flt. Sub-Lt. H. W., R.N.

SLIGHTLY INJURED.—Emmett, Prob. Flt. Officer C. W., R.N.

Reported July 26th.

ACCIDENTALLY KILLED.—Brett, Flt. Sub-Lt. L. H., R.N.

MISSING, BELIEVED KILLED.—Sharman, Actg. Flt. Comdr. J. E., D.S.C., R.N.

MISSING.—Page, Flt. Lt. J. A., R.N.

ACCIDENTALLY INJURED.—Bragg, Prob. Flt. Officer E. L., R.N.

Reported July 27th.

ACCIDENTALLY INJURED.—Vincent, Flt. Sub-Lt. F. J., R.N. Nightingale, Flt. Sub-Lt. C. L., R.N.

Reported July 29th.

MISSING, BELIEVED KILLED.—May, Flt. Sub-Lt. T. C., R.N.

WOUNDED.—Staff Surgeon Edward L. Atkinson, R.N. Campbell-Orde, Flt. Sub-Lt. A. S., R.N.

ACCIDENTALLY INJURED.—Wilson, Flt. Sub-Lt. W. C., R.N.

PREVIOUSLY REPORTED MISSING, NOW REPORTED MISSING AND BELIEVED KILLED.—Bray, Flt. Sub-Lt. F., R.N.

PREVIOUSLY REPORTED DIED AS PRISONER, NOW REPORTED ALIVE AND STILL A PRISONER.—Trechmann, Flt. Sub-Lt. B. A., R.N.

PERSONAL NOTICES.

DEATHS.

BEGG.—Flt. Sub-Lt. R. Gordon Begg, R.N., whose death was announced last week, was educated at Dorset House, Littlehampton, and Oundle School. He joined the Royal Naval Air Service in June, 1916, was selected for seaplane service, and after qualifying proceeded on active service in March, 1917.

BUSBY.—Flt. Sub-Lt. E. W. Busby, R.N., was shot down and killed in an air fight on July 10th. The second son of Mr. and Mrs. G. E. Busby, of Selly Hill, Birmingham, he was educated at King Edward's High School, Birmingham, and when war broke out he was serving his engineering apprenticeship with the Birmingham Small Arms Company.

He joined the R.N.A.S. in June, 1916, went abroad last April, and was responsible for bringing down one kite balloon and four enemy machines, driving down two others, and assisting in destroying another two. His Flight Commander writes:—"He is a serious loss to the squadron and a personal loss to us all."

MORRISON, HERVEY, and WARD.—Verdicts of "Accidental death" were returned at inquests held on July 24th on the bodies of Flt. Comdr. Louis Duncan Morrison, R.N., aged 31, Lieut. William Baker Hervey, R.N.V.R., aged 33, and Second Class Air Mechanic Henry Richard Ward, R.N., aged 19, who were drowned on the East Coast on July 21st.

ENGAGEMENT.

SHOPPEE—TAIT.—The engagement is announced of Flt. Lt. L. Conrad Shoppee, D.S.C., R.N., son of Eustace Cyril Shoppee, Esq., of Cape Town, South Africa, and Hilda, only daughter of the late Captain Thomas A. Tait, R.N.R., and niece of the Rev. R. Gifford-Wood, M.A., B.D., Vicar of East Cowton, Northallerton, Yorkshire.

BIRTH.

LAYARD.—On July 29th, at "Tarmon," Aldrington Road, Streatham Park, Molly, the wife of Lt. A. Raymond Layard, R.N.V.R., attached R.N.A.S., of a son.

MILITARY.

G.H.Q. COMMUNIQUÉS.

JULY 24th, 9.0 p.m.—Great activity on the part of our aeroplanes continued yesterday, and much successful work was again accomplished in co-operation with our artillery. Over four tons of bombs were dropped by our raiding squadrons on the enemy's aerodromes, ammunition depots, and railway junctions.

Fewer German aeroplanes were encountered, and fighting was not so severe. Three hostile machines were brought down, and three others were driven down out of control.

None of our machines are missing.

JULY 25th, 9.10 p.m.—Yesterday, thick haze interfered greatly with operations in the air. Bombing raids were none the less carried out by our aeroplanes during the day as well as during the previous night.

Fighting took place in the evening, and four German machines were driven down out of control.

Three of our machines are missing.

JULY 26th, 8.35 p.m.—Owing to thick mist, there was little activity in the air yesterday. One German machine was brought down in air fighting.

One of our machines is missing.

JULY 27th, 8.50 p.m.—Little flying was possible yesterday until the evening, when sharp fighting took place for about two hours. One hostile machine was brought down, and one other driven down out of control.

Two of our machines are missing.

JULY, 28th, 9.50 p.m.—Yesterday morning aerial activity was slight, but from 1 p.m. till dark it became very great. The fighting was intense, and the day proved a markedly successful one for our aviators.

The vigorous offensive tactics employed enabled our artillery machines to carry on their work successfully during the day, and made it possible for us to take an unusually large number of photographs.

Our bombing squadrons, moreover, carried out many raids and bombed four of the enemy's aerodromes. Some of our machines came down to very low altitudes at a distance of over 40 miles behind the enemy's lines.

Fifteen German machines were crashed to the ground, and 16 others driven down out of control.

Three of our machines are missing.

JULY 29th, 9.39 p.m.—Yesterday, there was again great activity in the air, and fighting was continuous.

On the night of the 27th-28th inst., important railway stations and two hostile aerodromes were bombed by our aeroplanes, and during the day a number of other bombing raids, as well as much photographic and artillery work, were carried out by us with success.

In air fighting 16 German machines were brought down and 14 others were driven down out of control. In addition, two hostile observation balloons were brought down in flames.

Thirteen of our machines are missing.

JULY 30th, 8.52 p.m.—On the night of the 28th-29th inst. bombs were dropped by our aeroplanes on a German aerodrome, two important railway stations, and an ammunition depot, where fires and explosions were caused.

Bombing operations were continued yesterday, and there was great activity in the air until 10 a.m., when a severe and sudden thunderstorm prevented further flying. Many of our aeroplanes were caught in the storm, and four have not returned.

In air fighting four German aeroplanes were brought down and two others were driven down out of control.

Six of our machines are missing, including those lost in the storm.

WAR OFFICE COMMUNIQUÉ.

JULY 26th.—The G.O.C. British Forces in Macedonia reports:

Except for the successful raid on Homondos, which has already been reported, activity during the past week has been confined to aerial enterprises. Our machines have bombed Porna station, camps near Seres and Demirhissar, the depot at Petric, and Dedli (north-west of Lake Dorian).

HOME COMMAND COMMUNIQUÉS.

JULY 27th.—The latest reports show the following revised list of the casualties which resulted from the air raid of July 7th:—

KILLED.

Men.	Women.	Children.		Total.
42	9	8	=	59

INJURED.

Men.	Women.	Children.		Total.
98	45	50	=	193

These figures include all casualties of every nature.

[Since the issue of the last communiqué on the subject of the air raid of July 22nd, two more deaths are reported to have taken place.

The total number of casualties is now:—13 killed and 26 injured.]

THE CASUALTY LIST.

Reported July 23rd.

KILLED.—Johnstone, Capt. M., R.F.C.

WOUNDED.—Rouquette, Sec. Lt. D. G., A.S.C., attd. R.F.C.

MISSING.—Coombs, Sec. Lt. V. C., R.F.C.
Davis, Sec. Lt. G., R.F.A. and R.F.C.
Parkes, Sec. Lt. G. A. H., R.F.C.

CORRECTIONS.—Hurley, Sec. Lt. A. V., R.F.A. (reported wounded), should read:—Hurley, Sec. Lieut. A. V., R.F.C.
Cruikshank, Sec. Lt. K. G., R.F.C. (reported missing), should read:—Cruickshank, Sec. Lt. K. G., R.F.C.

KILLED.—R.F.C.—Jessop, 25501 1st Cl. Air Mech. J. O. (Forest Hill, S.E.).
McMahon, 43271 2nd Cl. Air Mech. S. (East Ham, E.).

AUSTRALIAN FORCE.—MISSING, BELIEVED KILLED.—Searle, Sec. Lt. A. H., Flying Corps.

Reported July 26th.

KILLED.—Brufton, Sec. Lt. H. C., Rif. Brig. and R.F.C.
Palmer, Sec. Lt. P. E., R.F.C.

PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—
Adams, Sec. Lt. F., R.F.C.
Carey, Sec. Lt. A. S., R.F.C.
Kelly, Sec. Lt. O. R., North'd. Fus., attd. R.F.C.
Thompson, Sec. Lt. J., R.F.C.

WOUNDED.—Davies, Sec. Lt. R. S., R.F.C.
Hartridge, Lt. F. W., R.F.C.

MISSING, BELIEVED KILLED.—Paget, Lt. G. L., North'd Fus., attd. R.F.C.

MISSING.—Felton, Sec. Lt. C. T., R.F.C.
Hay, Lt. R. B., M.C., W. Yorks. R., attd. R.F.C.
Partington, Lt. O. J., R.F.C.
Thompson, Sec. Lt. W. G., Suff. R. and R.F.C.
Workman, Lt. C. S., M.C., Sco. Rif., attd. R.F.C

PREVIOUSLY REPORTED MISSING, NOW REPORTED PRISONERS IN GERMAN HANDS.—Barrie, Sec. Lt. F., R.F.C.
de Selincourt, Capt. A., R.F.C.
Lister, Sec. Lt. B. S., R.F.C.
Moody, Sec. Lt. B. C., Lond. R. and R.F.C.
Robertson, Sec. Lt. G. M., High. L.I., and R.F.C.

ACCIDENTALLY KILLED.—R.F.C.—Fenton, 69421 Sec. Cl. Air Mech. A. (Musselburgh).

Reported July 27th.

WOUNDED.—Barney, Sec. Lt. L. W., R.F.C.

Reported July 28th.

WOUNDED.—Noss, Sec. Lt. A. R. H., R.F.C.

CANADIAN CONTINGENT.—DIED OF WOUNDS.—Porter, Lt. H. E. M., Cent. Ont. R., attd. R.F.C.

WOUNDED.—McIntosh, Lt. P. D., Queb. R., attd. R.F.C.

MISSING.—Weld, Lt. D. S., W. Ontario R., attd. R.F.C.

CORRECTION.—Cotton, Lt. H. H., Inf., attd. R.F.C., previously reported missing, now reported prisoner in German hands, should read:—Cotton, Lt. H., Quebec R., attd. R.F.C.

Reported July 29th.

WOUNDED.—Lowcock, Capt. R. J., M.C., Sher. For., attd. Madge, Lt. J. B. C., R.F.C. R.F.C.

MISSING.—Grosset, Lt. W. E., High. Cyclist Bn., attd. R.F.C.
Jardine, Sec. Lt. R. G., R.F.C.
Shepherd, Sec. Lt. A. S., D.S.O., M.C., R.F.C.

KILLED.—R.F.C.—Duncan, 53358 2nd Cl. Air Mech. T. (Craigie); Whatley, 2056 Sgt. H. A. (Pewsey).

DIED OF WOUNDS.—Lancers, attd. R.F.C.—Russell, 6564 L.-Cpl. F. (Long Melford).

PERSONAL NOTICES.

Deaths.

BASSFORD.—An inquest was held at Dover on July 30th on the body of 2nd Air Mech. T. J. Bassford, who was killed by the propeller of a machine which crashed into a tent. The inquest was adjourned.

BERWICK.—Sec. Lt. Robert G. Berwick, R.F.C., who was killed in a flying accident at Scampton, Lincolnshire, on July 6th, was the younger son of Mr. and Mrs. W. J. Berwick, of Schubert Road, East Putney. Mr. Berwick was 20 years of age. He joined the Inns of Court Officers' Training Corps in 1915, serving with that unit until his transfer in February, 1917. His brother officers spoke of him as a brave and fearless pilot, and his loss is deeply mourned in his squadron and by all who knew him.

BURT.—Lt. Owen Lyndon Burt, R.F.C., who was killed in action on July 23rd, was the son of Mr. and Mrs. Owen Burt, of 37 York Terrace, Regent's Park. He was 21 years old.

CLIFTON.—Lt. George Leake Cecil Clifton, R.F.C. (died of wounds), was third son of Mr. R. Cecil Clifton, Under Secretary for Lands, Western Australia. Mr. Clifton came from Perth, Western Australia, and saw service in Egypt and Gallipoli. He became a signaller, and was amongst the last to leave the Peninsula on the evacuation. He was on the Western Front until November, 1916, when he was sent to an Officers' Training Battalion, and secured a commission in the Royal Flying Corps. Only recently he won his wings, and he was considered a most promising pilot; he was exceedingly popular among his brother officers and men.

D'ERF-WHEELER.—Captain Percival Francis Crommelin d'Erf-Wheeler, Dorset Regt., attd. R.F.C., who was killed on duty on July 24th, was the eldest son of Grace and Percy d'Erf-Wheeler and grandson of the late Dr. Blyth, Bishop in Jerusalem. He was 23 years of age.

DUERDEN.—Sec. Lt. H. Duerden, R.F.C., was landing in a field in Lincolnshire on July 28th, when his aeroplane struck a tree and turned over. He was picked up unconscious and died shortly after in a hospital.

HART-DAVIES.—Lt. Ivan Beauclerk Hart-Davies, R.F.C., who died on July 27th, as the result of an aeroplane accident in England, was the son of the late the Rev. John Hart-Davies and Mrs. Hart-Davies, of Southam Rectory, Warwickshire. He was 39 years of age.

Mr. Hart-Davies' death will be very deeply felt by a large number of friends in the Midlands, where he was well known as a pioneer of motoring. He was a sportsman of the finest type, an all-round athlete, and personally immensely popular.

He learned to fly for sport before the war, and, despite his being considerably over what is officially considered to be the proper age for flying, he became a very good pilot. He joined the R.F.C. not long after the outbreak of war, giving up a profitable occupation to do so, and saw considerable service, chiefly as a pilot of fighting machines.

He was lately appointed to a new fighting squadron, and was looking forward keenly to the prospect to meeting the enemy with the odds more in his favour than had hitherto been the case. In him the R.F.C. has lost a popular and gallant officer, and many of us have lost a highly valued friend.—C. G. G.

HUGGAN.—Sec. Lieut. Thomas Huggan, R.F.C., aged 19, was killed while flying on the South Coast on July 24th. His machine side-slipped and nose-dived from an altitude of 50 ft., and caught fire. The aviator's body was found among the wreckage.

Sec. Lt. Thomas Huggan, R.F.C., was in the nineteenth year of his age, and was the younger son of Mr. Joseph Huggan, of Pudsey. He had his commission in September, 1916.

He was educated at Marlborough College, where he was head of his house (Littlefield), a member of the school hockey eleven. He entered the R.F.C. in September, 1916, on his 18th birthday. From December, 1916, to last July he was in France as an observer, and he had just begun his pilot's course in England when he met his death.

HUGHES.—Sec. Lt. E. P. Hughes, R.F.C., who has died as the result of a flying accident on June 9th, was the eldest son of Mr. E. J. Hughes, of Ellesmere, Knapdaar, near Burghersdorp, Cape Colony, and a nephew of Colonel Hughes, of the Defence Department, Pretoria. He came to England with the South African Contingent in 1915, was transferred to the R.F.C. in August, 1916, and obtained his pilot's certificate early in the present year. The injuries he received on June 9th were very serious, and he died in a military hospital on July 27th. Before his accident he had been for some time engaged on munitions work with certain inventions of his own.

KILGOUR.—The Dover coroner held an inquest on July 30th on the body of Lt. Arthur R. Kilgour, R.F.C., who was killed while doing a tail slide. According to a witness who had previously completed a 40-minutes' acrobatic flight in the machine it must have become uncontrollable, and, coming down in a steep spiral, crashed to the ground. Lt. William Williams, who was in the machine as pupil, was seriously injured. A verdict of "Accidental death" was returned.

MACFARLANE.—Sec. Lt. Harold Embleton Macfarlane, R.F.C., who was killed on July 14th, aged 18, was the eldest son of Mr. and Mrs. Harold Macfarlane, of Northwood, Middlesex. Born at Harrow in 1898, he received his early education at Mr. Douglas Gould's Preparatory School, The Briary, Westgate-on-Sea. From The Briary he proceeded, in September, 1911, to Westminster School, where he remained five years. He played for his house (Home Boarders) at cricket, football, and fives, and took part in the drill competition of the O.T.C. On leaving school at the end of the summer term of 1916, when he received his 3rd eleven colours, he joined the Army, and received his commission in February and his "wings" in May. He went to the front in June.

A schoolfellow who was with him three years wrote:—"Every one was fond of 'Peter.' He always had such a jolly way with him. I never saw him down in the dumps or out of temper once the whole time we were together. . . . 'Mac' would always do anything that was dashing. To have seen him charge up and down the football field, not caring a hang for his shins, his only idea being to put the ball into the goal, is enough to tell you of what good stuff he was made."

MIDDLETON.—Lieut. J. R. Middleton, R.F.C., who was wounded and taken prisoner on March 24th, and was kept in hospital at Mulheim Ruhr, Germany, till he died there on June 21st.—Mrs. Middleton, 38, Inverleith Place, Edinburgh, will be very grateful to any person who will send her the name and home address of any prisoner who was in the hospital during that period and may be able to give information about her son during his illness.

NORRIS.—Sec. Lt. Harold Aubrey Blurton Norris, R.F.C., who was killed on July 24th, was the only son of Harold and Flo Norris, Windydene, Dartford Heath, Kent.

PHILLIPS.—In a town in the Eastern Counties on July 24th an inquest was held concerning the death of Lt. Joseph Le Phillips, R.F.C., a Canadian, aged 23. He had been learning to fly for over a month, and started on a solo flight, but did not return. Afterwards he was found in a cornfield, his aeroplane having apparently turned over twice. A verdict of accidental death was returned.

ROBERTSON.—Sec. Lt. Archibald Gordon Robertson Black Watch, attd. R.F.C. (previously reported missing, now reported

killed in action near Roulers on June 8th), was second son of Mr. Duncan Robertson, of Crantit, Orkney. He was 19 years of age, and had his commission in the Black Watch in August, 1916.

THOMAS.—Capt. R. N. Thomas, R.F.C., who was killed in action on July 23rd, while serving with the Egyptian Expeditionary Force, had previously served 11 months in France, and was recently awarded the Croix de Guerre. He left England only a few weeks ago. He was the eldest surviving son of Brig.-Gen. Sir Owen and Lady Thomas, Cemaes, Anglesey, and was one of three brothers who served under their father in the Welsh Army in 1914-15. He transferred to the R.F.C. in 1915. In the South African War he served as a trumpeter in the Prince of Wales's Light Horse, a regiment which was raised and commanded by his father. His youngest brother, Lt. Trevor Thomas, R.W.F., was killed in action in January, 1916, and his only surviving brother is a Captain in the R.F.C.

THOMAS.—Lt. Maurice Wotton Thomas, R.F.A. and R.F.C., reported missing on August 5th, now officially presumed killed on that date, aged 21, was the younger son of Mr. and Mrs. Alick Thomas, of Worcester Park, Surrey. He was educated at Parkside, Ewell, and in September, 1907, passed into Osborne College, where, as the result of an epidemic, he contracted an illness, which necessitated his being invalided, as unfit, from the Royal Navy in 1910. After 18 months of convalescence he was allowed to continue his education with Mr. Sellar, of St. Andrew's, and Mr. Tinniswood, of Camberley, whence he passed into Woolwich in 1912, and, passing out in September, 1914, received his commission in the R.F.A.

In May, 1915, he went to the front as A.D.C. to a general commanding an R.A. division, and was promoted lieutenant in July, when it was decided that he was specially qualified by his training for the R.F.C., to which he was seconded as observer. After many experiences he had an accident in December, 1915, and came home. He made a speedy recovery, and was sent to a reserve squadron and gained his wings. In May, 1916, he was again sent out, doing much valuable work over the enemy positions.

He was a fine revolver shot, and a member of the shooting eight when at Woolwich. His Squadron Commander and brother officers all bear testimony to his fearlessness, keenness, and efficiency both as observer and pilot. His elder brother, Capt. Alec Vaughan Thomas, E. Surrey Regt., attached 2nd Hampshire Regt., was killed in Gallipoli, August 6th, 1915, aged 22.

TOPHAM.—Sec. Lt. Michael Topham, R.F.C., whose death was announced last week, was born in India in 1895, he came to England at an early age and was educated first at Yardley Court School (Mr. A. L. Bickmore), Tonbridge, afterwards proceeding with a foundation scholarship to Tonbridge School, where he became head of Manor House. At school he specially distinguished himself as a member and for two years the captain of the O.T.C. shooting eight.

He left school in 1914 after gaining an open scholarship at Downing College, Cambridge, and a Judd scholarship from the school; but on the outbreak of war he enlisted in the U.P.S. Battalion of the Royal Fusiliers, obtaining the rank of sergeant. In the following year he went with his regiment to France and served through the winter of 1915-16. In 1916 the regiment returned to England and he entered a cadet battalion and, passing out first, volunteered for the Royal Flying Corps. He obtained his wings early this year, and was soon afterwards sent to the front as a flying officer.

Within a month of his returning from a successful bombing raid with his squadron he was reported missing. Information through a reliable channel has now been received that he was shot down and instantly killed. His C.O. wrote that he was an excellent pilot, very keen, a great acquisition to the squadron, and considered capable of great things.

TURNER.—Lt. Warren Geoffry Dalton Turner, R.F.C. (previously reported missing, now reported killed in action over the German lines on May 24th), was second son of Mr. and Mrs. A. Turner, late of Clifton Lodge, East Heath Road, Hampstead. He was 21 years of age, and had his commission in the New Armies in the early months of the war. Transferring to the R.F.C. he had his "wings" in July of last year, and his Army rank of lieutenant was gazetted in October.

WILLIAMS.—Sec. Lt. Vaughan Floyer Williams, R.F.C., who was reported missing on April 2nd, 1917, and now known to have been killed in an air fight on that day, was 18 years of age, and was the youngest son of Mr. and Mrs. Glynne Williams, of 7, Berkeley House, Hay Hill, W.

Engagements.

MACLEAN—LEWIN.—A marriage has been arranged between Capt. (temp. Major) C. T. Maclean, M.C., Royal Scots Fusiliers, attd. R.F.C., and Maria Dorothy (Birdie) Lewin, only child of Mrs. Lewin, Kirklevington Hall, Yarm.

SEELY—NICHOLSON.—A marriage has been arranged, and will shortly take place, between Brigadier-General the Right Hon. J. E. B. Seely, C.B., D.S.O., M.P., of Brooke House, Isle of Wight, and the Hon. Mrs. George Nicholson, widow of Captain George C. N. Nicholson, R.F.C., and youngest daughter of Viscount Elibank.

It will be remembered that the late Captain Nicholson was General Seely's private secretary. Captain Nicholson later endeavoured to assist in improving the quality of the machines supplied to the R.F.C., and was eventually killed in an accident on an inferior machine.

Marriages.

BEST—SMITH.—At St. Mary's Parish Church, Wimbledon, on July 28th, Sec. Lt. Robert Dudley Best, R.F.C., elder son of Mr. Robert H. Best, Birmingham, was married to Beryl Gladys, younger daughter of the late Robert Smith and of Mrs. Robert Smith, Ardmore, Marryat Road, Wimbledon Common, S.W., by the Rev. Arthur Bridge, late Rector of Worth, Sussex, assisted by the Rev. E. J. Becknell, Principal of the Clergy House, Wimbledon.

PAYNE—CRAVEN.—On July 26th, at St. Martin's-in-the-Fields, Trafalgar Square, Albert Wyndham, Lt., R.F.C., fourth son of the late Mr. W. H. Payne and of Mrs. Payne, "Rosendale," Caversham, Reading, was married to Dorothy Constance, youngest daughter of Mr. and Mrs. Arthur Craven, Hallas Hall, Cullingworth, Yorks, by the Rev. Herbert Pegg.

Births.

DUFF.—On July 26th, at Fritton, St. Alban's Crescent, Bournemouth, the wife of Capt. Ian Duff, R.F.C., of a son (still-born).

MANN.—On July 24th, at 22, Charlbury Road, Oxford, Marie (*née* Berthon), the wife of Capt. A. J. Mann, R.F.C., of a daughter.

Sec. Lt. Kenneth B. Cooksey, Royal West Kent Regt., attd. R.F.C., has been missing since April 8th. His mother, Mrs. Cooksey, of Springwell House, Old Hill, Staffordshire, would be grateful for any news.

* * *

Sec. Lieut. H. Berners Begg, who has been missing since November 24th, 1916, came home from India to join the Royal Flying Corps. He took his "wings" in the September of that year.

FRANCE.

Official Communiqués.

July 24th.—Last night enemy aeroplanes dropped several bombs on the town of Nancy and on the region south of that town. There were no casualties.

Army of the Orient.—The Allied aviators bombarded successfully enemy encampments in the region of Demirhissar (Struma front) and Staravina.

July 28th.—Army of the Orient.—British aviators bombarded the enemy's encampments in the region of Rupel. There have been artillery activity in the Majadag region and patrol encounters on the Serbian front.

* * *

It is reported that at a quarter to five on July 25th a German aeroplane flew over a French ambulance on the Vaux-Varennes front, to the north of Jonchery-sur-Vesle. It is said that the aviator descended to a very low altitude, so that he was clearly able to distinguish the red crosses painted on the roof, and then dropped four bombs, which all hit their mark, which was deliberately chosen. A doctor, a chemist, and a nurse were killed on the spot, a second doctor succumbed to his injuries shortly afterwards, and a third doctor and an administrative official were seriously injured.

* * *

Late on the night of July 27th and early on the morning of July 29th alarms were given in Paris of a German air raid. The sky was brilliantly clear, and on both occasions a large number of French aeroplanes could be seen flying at a great height. In neither case did the raid cause any damage.

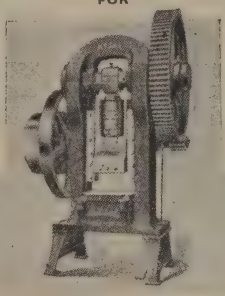
A semi-official note issued in Paris on July 29th says:

The German official communiqué of July 28th asserted that German aviators bombed railway stations and military establishments in Paris during the course of the preceding night, and that certain of the projectiles hit their marks. This assertion is untrue. The attempted attack by enemy aeroplanes to the south of Paris caused no loss of life or material damage.

GERMANY.

Official Communiqués.

July 28th.—During the course of numerous engagements the enemy lost 13 aeroplanes.



Last night bombs were dropped upon the railway stations and military establishments of Paris. Hits on the objects aimed at

were observed. Our aviators returned unharmed in spite of the strong defensive fire.

July 29th.—Aerial activity was extraordinarily lively, especially on the Flanders front. Thirty-five enemy aviators were shot down. Ober-Lieut. Dostler, at the head of a pursuing squadron, destroyed a squadron of six enemy aeroplanes, and himself gained his 20th aerial victory. Ober-Lieut. Ritter von Tutschek shot down his 19th and 20th aerial opponents in battle.

July 30th.—The enemy lost 10 aeroplanes in aerial battles. Ober-Lieut. Ritter von Tutschek brought down his 21st opponent

RUSSIA.

Official Communiqué.

July 29th.—Between the Baltic and the River Pripet there was aerial activity.

July 30th.—In the Baltic Sea on Friday an enemy Zeppelin while flying over the Aland Islands dropped 20 large bombs on the town of Tornby, near Mariehamn. The Zeppelin was fired at by the guns of the Fleet, as well as by the shore batteries.

In the Gulf of Riga squadrons of enemy seaplanes carried out raids in the neighbourhood of the Island of Tserel and Arensburg. Fired at by the Fleet and the shore batteries the machine disappeared, after dropping about 20 bombs without effect.

A squadron of enemy aeroplanes in the same district attacked one of our destroyers, dropping eight bombs without effect.

ITALY.

Official Communiqués.

July 25th.—Two of our bombing flights, accompanied by chasing aeroplanes, carried out a raid on hutments and railway works at San Daniele, on the Carso. All our machines returned to their bases.

July 26th.—Last night one of our airships paid a surprise visit to S. Lucia (Tolmino) (Upper Isonzo), and dropped a ton of high explosives on the railway works, doing considerable damage.

July 28th.—The air services were active along the whole front. On the evening of the 27th one of our airships effectively bombed the railway between S. Lucia (Tolmino) and Bazza di Modrea (Upper Isonzo), and the Opcina (north of Trieste) military works were damaged by our aeroplanes.

This morning a large flight with an escort of chasers dropped nearly three tons of high explosives on the electric power station at Idria and on hutments in Chiapovano Valley (north-east of Gorizia).

July 29th.—Yesterday evening one of our large bombardment air squadrons, escorted by chasers again raided the military establishments at Idria and the hutments in the Chiapovano Valley, and, notwithstanding heavy fire from the enemy's anti-aircraft guns, dropped four tons of high explosives.

On the return journey the chasers brilliantly engaged a large number of enemy machines which had risen, and, after having brought down two, returned safely to their base, which the battleplanes had already succeeded in reaching.

July 30th.—On the Julian front air activity was considerable; an enemy machine was brought down by one of our aviators east of Tolmino (Upper Isonzo).

* * *

As a reprisal for an attack on Grado by Austrian seaplanes, Italian seaplanes on July 28th dropped bombs on the enemy's hangars at Prosecco. The same day the enemy delivered an air attack on Termuli, injuring four persons, and on July 28th the Austrians repeated their attack on Grado.

* * *

An American aeronautical mission has been on a visit to this country to get an insight into what constitutes the present-day "complete as fitted."

Col. Mitchell, Major Bolling, Commander Westervelt, Capt. Clark, and Lieut. Child are reported as being among the officers attached to the mission, while Mr. Marmann and Mr. Hughes are, presumably, civilians, of the party. Samples of all the various machines now in use at the home aerodrome were exhibited to them at Mirafiori a few days ago, and some smart airmanship was visible to him who had eyes to see it.

Mention of this flying ground reminds me that so far I have not for a good enough reason made any mention of the A.E.R. firm of Turin in these notes. The company builds Caudrons, and, to all accounts, does this to everyone's great satisfaction. Mention of the name in connection with height records and school machines is about all one can report as yet.

A sympathetic eulogy of British Blimps as supplied to this country is published by a contemporary.—T. S. Harvey.

BELGIUM.

Official Communiqué.

July 29th.—Our aviators, whenever the weather was favourable, have displayed very great activity. Three enemy aeroplanes were brought down, one of them falling a few yards from our advanced trenches.

SERBIA.

Official Communiqué

July 23rd.—Our aviators brought down an enemy aeroplane, which fell in our lines near Kapignani (Moglena sector). They also dropped 32 bombs on Kravica and Gradesnitza (west of the Moglena).

HOLLAND.

"Het Volk" (Amsterdam, July 30th), reports that a German aeroplane landed during the previous day near Oostburg (north-east of Bruges) owing to a damaged propeller. The pilot, a naval aviator, has been interned.

U.S.A.

A message from New York on July 26th states that Mr. Symond Saxe has offered a prize of one thousand dollars to the first American who drops bombs on Berlin. This offer is made in memory of the relatives he lost in the sinking of the "Lusitania."

* * *

It was reported from New York on July 24th that the Industrial Workers of the World have closed down all the spruce mills of Wisconsin and Minnesota. It is believed that this has been brought about by German money. The Government is expected to take a strong action, as spruce is essential for the building of aeroplanes.

* * *

Mr. Quentin Roosevelt, the ex-President's youngest son, is a member of the contingent of American aviators who are coming to Europe.

THE CURTISS CORRUPTION CHARGE.

At Bow Street, on July 25th, William August Casson (64), a retired Civil Servant, living at Bedford Road, Chiswick, was charged on a warrant, before Sir John Dickinson, for "unlawfully and corruptly conspiring with Wing Commander John C. Porte, R.N., and Lyman J. Seely to contravene the provision of the Prevention of Corruption Act, 1906, in respect of large sums of money from time to time corruptly paid to and received by John C. Porte, an agent of the Crown, in respect of certain contracts between the Lords Commissioners of the Admiralty and the Curtiss Aeroplane Company, of New York."

Sir Charles Mathews, director of Public Prosecutions, occupied a seat on the Bench.

Sir Archibald Bodkin, who appeared on behalf of the Public Prosecutor, said that, so far as the case was concerned, he would suggest that he should on the present occasion only prove the arrest of the defendant. He would then ask for a remand, and would open the case on a future occasion. The case was adjourned until August 3rd.

The magistrate said he was prepared to accept bail of £1,000 or two sureties of £500 each. Mr. F. A. Rudall, solicitor, of 48, Watling Street, E.C., and Mr. Bernard Barnes, of Stanthrop Road, Streatham, came forward and were accepted, both gentlemen stating that they were not acting professionally.

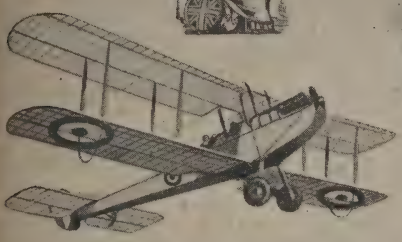
* * *

On March 30th **Mr. Billing** asked whether any officer or official at present concerned with the construction or origination of aeroplanes, or who has planned designs for the Royal Naval Air Service, has ever produced a successful flying machine of the heavier-than-air type; whether any such machines have been used on active service; whether several officers who have produced successful designs before the war and joined the Royal Naval Air Service on or about the outbreak of the war have left the Service and entered the employment of private firms; and whether the residue have been proved to possess sufficient ability to justify their being entrusted with the approval, alteration, or condemnation of designs produced by private constructors of proved experience?

Dr. Macnamara: The answer to the first two parts of the question is in the affirmative. As regards the third part, officers have been allowed to resign their commissions in order to enter the employment of private firms where it has been clear that their experience and technical knowledge would be of advantage in the production of machines, and, therefore, in the public interest. As regards the last part of the question, the hon. gentleman is, of course, aware that the general question of the design of aircraft is now a matter which is dealt with by the Air Board. That being so, it does not appear to me that any useful purpose would be served by discussing by way of question and answer the abilities of the technical officers of the Royal Naval Air Department.

Mr. Billing: Can the right hon. gentleman give me the name of any type, or the name of any given machine, which these officers have designed which has been successful?

Dr. Macnamara: The hon. gentleman must put that question on the Paper.



On April 2nd **Mr. Billing** asked the First Lord of the Admiralty the names of the officers of the R.N.A.S. who had designed the aeroplane or seaplane which had been successfully employed against the enemy?

Dr. Macnamara: Wing-Commander Porte, R.N.

[It will be noted that Commander Porte was the only officer of the R.N.A.S. credited officially with having produced a successful aeroplane.—C. G. G.]

AVIATION KIT
AT
Dunhills Ltd
2, CONDUIT STREET, LONDON, W.

THE equipment of the Aviator must always be of the Best. Not only must his garments be as warm and serviceable as money can make them, but the cut and finish must be of as high standard to match. Just as the Government spare no expense to provide what they consider the best for the Flying Service, so to supplement what the Government issues DUNHILLS put all their experience and skill into giving the Best Quality and the Best Value.

THOSE who do not possess our Catalogue should write for one at once.

THOSE who do not know our shop at No. 2, Conduit Street should look in next time they get leave.

In the Hands of the Enemy.

The following list of 148 British aeroplanes which fell into the hands of the Germans during April, 1917, has been published in the German Press :—

[Many of the names appear to have been mangled in transcription.—Ed.]

35 B.Es.

B.B.7061.—Names of passengers not given.
A.2815.—Davidson, killed.
A.2140.—First Lieut. Henry, Lieut. Logan.
A.2141.—Lieut. White, B. W.; Lieut. Evans, Bernhard; both killed.
A.3330.—The observer severely wounded; the pilot killed.
5849.—Lieut. F. L. Kitchen, 4th Squadron, killed.
2769.—F. Mathews, slightly wounded.
?.—W. Y. Chalk.
A.78.—Sec. Lieut. Davies; Sec. Lieut. Samuel; both taken prisoners.
2562.—Lieut. Comb; one passenger killed, the other severely wounded.
2553.—Sergeant John Field Danger (Dangerfield?); Mechanic E. D. Harvey, taken prisoners.
3213.—Lieut. E. G. Dilmitt; Sergeant S. Smith Fieldhouse; both taken prisoners.
19683.—Passengers burnt to death.
N.R.1268.—Passengers killed.
Austin motor 2203.—Lieut. Granes, burnt to death.
5870.—The pilot severely wounded; the observer unwounded; both taken prisoners.
Motor 7177.—Lieut. Radcliffe, killed.
2713.—Both passengers burnt to death.
3681.—Lieut. Statesman (?) taken prisoner.
?.—Lieut. Follit, killed; F. D. Kirkham, slightly wounded.
2949.—Captain Allan, killed; Lieut. Mactavish, wounded and taken prisoner.
A.2916.—Both passengers killed.
In 13 B.E. aeroplanes the number of the aeroplane and the name of the passengers could not be ascertained.

16 Sopwith Two-seaters.

A.2401.—Sergeant Dunne; Lieut. Warrens; one of the passengers killed, the other taken prisoner.
A.1073.—The pilot taken prisoner; the observer killed.
A.3421.—Lieut. A. G. Pepper, taken prisoner; Lieut. W. L. Day, killed.
7675.—Both passengers killed.
(Fixed engine) 7544.—Both passengers killed.
?.—Lieut. Wordsworth; both passengers killed.
7806.—Both passengers killed.
?.—Lieut. Heagerty, wounded; Lieut. Health-Cantle, killed.
5117.—Sec. Lieut. Harold Edwards, taken prisoner; Gunner Coghlan, killed.
5171.—Lieut.-Col. Rathborne, taken prisoner unwounded; Gunner Turner, killed.
A.3323.—Pilot wounded; observer killed.
A.1089.—Sec. Lieut. Newenhem, taken prisoner, slightly wounded; Sec. Lieut. A. E. Crisp, taken prisoner.
A.9934.—Lieut. Clifford Reece; Sergeant Wilh. Moult; taken prisoners, the latter wounded.
In 3 Sopwith two-seaters the number of the aeroplane and the names of the passengers could not be ascertainel.

8 Sopwith Single-seaters.

? Motor: Mercédès. Sec. Lieut. Fasker, taken prisoner.
22 Type II.—Passenger taken prisoner.
A.6690.—Lieut. Roche, taken prisoner unwounded.
3.6175.—Lieut. Capon, taken prisoner, slightly wounded.
A.6172.—Captain Mack, taken prisoner, severely wounded.
A.6160.—Sec. Lieut. Benaet, killed.
6175.—Lieut. Malone, 3rd Squadron, killed.
In 1 Sopwith single-seater the number of the biplane and the name of the pilot could not be ascertained.

1 Sopwith Triplane.

5448.—Lieut. Weil, killed.

27 F.Es.

4954.—Sub-Officer Wilson, Gunner Hadlow, taken prisoners.
5841.—Lieut. Powell, 13th Squadron, 12th Wing, and passenger, killed.
A.5151.—Capt. Tomlinson, slightly wounded; Lieut. Lenison, severely wounded.
A.6382.—Lieut. O'Beirne, killed; Lieut. Macdonald.
A.6371.—Lieut. Richards, killed; Lieut. Dodson, taken prisoner.
A.808.—Lieut. Musters, Sec. Lieut. Brandon, both killed.
A.805.—Sec. Lieut. Hinginbottom, severely wounded; Afflach, killed.
7714.—Lieut. Anley, slightly wounded; Mechanic Barnes.
A.21.—First Lieut. Birech (Birch ?) and Bongshield, both taken prisoners.
A.22.—Captain Shyber, N.G.
A.652.—Pilot Schreiber, Observer M. Lewis, both taken prisoners.
A.6.—Lieut. Hamilton, Gunner Snelling, both wounded.
?.—Lieut. Buttler, Mechanic Robert David, taken prisoners.
A.813.—Lieut. Callum, Lieut. Bell, both taken prisoners unwounded.
5969.—Shun and C. A. R., both killed.
4984.—Pilot and Observer taken prisoners, the former severely wounded, the latter unwounded.
(Fixed motor) 3759.—Lieut. M. A. Wood, Steward Thomas, both burnt to death.
1564.—M. Thopam, both passengers killed.
(Motor) 3577.—Lieut. George, Lieut. Bailly Hodson, both killed.
A.784.—Both passengers taken prisoners.
6385.—Lieut. H. R. Nikolsen, Cadet J. R. Johnston, both killed.
4883.—Both passengers taken prisoners.
A.825.—Names of the passengers unknown.
A.6355.—Lieut. Hondley and Lieut. Percival, both taken prisoners.
In 3 F.E. biplanes the numbers and the names of the passengers could not be ascertained.

5 Nieuport Two-seaters.

(? Rotary engine).—Sec. Lieut. Vaughan, F. Williams, both killed.
A.6667.—Sec. Lieut. Luscen and H. Pell, both killed.
N.6775.—Lieut. James and Melor, both killed.
9667.—Lieut. George Fleming, taken prisoner wounded; Pilot Lockyer, killed.
6671.—Lieut. Burbury, Worne, taken prisoners wounded.

19 Single-seaters.

6674.—Lieut. Sheape, 40th Squadron, taken prisoner.
A.6693.—First Lieut (?) severely wounded.
A.6692.—Sec. Lieut. Jennings.
4635.—The pilot taken prisoner.
2865.—The pilot killed.
A.6605.—Lieut. Rob. Bevington, taken prisoner, wounded.
A.6796.—Lieut. W. O. Russell, taken prisoner.
B.1511.—The pilot killed.
6772.—Capt. Alan Binnie, severely wounded.
2946.—The pilot killed.
3382.—The name of the pilot unknown.
A.313.—Lieut. A. Walter Wood, taken prisoner slightly wounded.
3192.—The pilot taken prisoner wounded.
(Rotary engine) —A. H. Hervey.
In five Nieuport single-seaters the number of the machine and the name of the pilot were not ascertainable.

13 Bristols.

7236.—The pilot killed, the observer severely wounded.
A.3340.—Lieut. Na. Nickler, severely wounded, and Lieut. George.
(Motor: Rolls-Royce) 10,426.—Lieut. Adams and Lieut. Steward, both wounded.
A.3320.—Lieut. H. A. Booker, severely wounded, and Alan Bolcheon, slightly wounded.
?.—Capt. Robinson, taken prisoner, and Lieut. Warberton.
A.3323.—Lieut. Brockhurst and Lieut. Broughton.
A.3338.—Capt. A. Tidmarsh and Lieut. Hollond, both taken prisoners.
9625.—Both passengers killed.
3199.—Watson and Law, wounded.
3322.—Sec. Lieut. Worshey, Sec. Lieut. Davis, taken prisoners, unwounded.
7195.—First Lieut. Hicks, taken prisoner.
A.2937.—Passengers killed.
Belgian No. 17.—Lieut. Jules Callant, Adjudant Armand Glibert, both killed.

4 Spads.

A.6681.—Pilot killed.
6753.—Lieut. W. L. Hamilton, taken prisoner.
B. 1562.—D. L. D. Davidson.
6682.—Sec. Lieut. Craig, taken prisoner.

11 Vickers.

4997.—Lieut. Bates and Barnes, both killed.
(? Motor: Rolls-Royce) 3 250 59.—Lieut. Sworder, killed, and Lieut. Menghirth.
A.4 1959.—First Lieut. Barrell, taken prisoner, the other passenger severely wounded.
5150.—Passengers of the 57th Squadron, killed.
A.19.—Sergt. Attwater and Lieut. Davis, both slightly wounded.
6391.—Sec. Lieut. Khondhzon (?), Sec. Lieut. Burns, 20th Squadron, taken prisoners, unwounded.
A.6352.—John Lingard and Edward R. Jennings, both taken prisoners.

They know good work when they see it.

They wanted good work and they got it. Messrs. Draper & Co. sent the smashed cylinder to BARIMAR because they wanted prompt service and accurate workmanship. The cylinder was from the engine of a sheep-shearing machine, and Messrs. Draper—who are handling a great deal of repair work in National interests—promptly sought

S. DRAPER & Co. **Cycle & Motor Repairers**
High Street, BROUGHTON, nr. Kettering.

BARIMAR LTD., *8th June*, 1917.
Poland St., London, W.

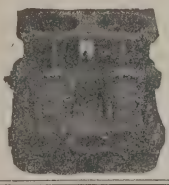
Dear Sirs,

We are in receipt of the cylinder which has been repaired very neatly, and we shall certainly send you all the welding we want doing. Thanking you again for the smartness of the repair.

Yours faithfully,
S. DRAPER & CO.

BARIMAR
Scientific Welding Service

—the largest organisation of Scientific Welding Engineers in the United Kingdom.



To **you** *in* **your** *repair needs—whether for cylinders, crank cases, gear boxes, agricultural implements, machine tools, driving gear, etc., Barimar Scientific Repairs are invaluable. Barimar Money-back Guarantee cuts out all your risk, and you are secured in the enjoyment of courteous attention, prompt delivery, and moderate charges—always.*

How to Send Goods.

Remove all fittings. Label plainly with your name and address. Despatch goods carriage paid, and post written instructions :: :: same day. :: ::

Don't risk being let down—send that job to Barimar instead.

In four Vickers the numbers and the names of the passengers were not ascertainable.

Also two tractor biplanes. Their numbers and the names of the passengers were not ascertainable.

1 tractor biplane: A.2592.—Lieut. Ross, severely wounded.

1 Martinsyde single-seater: G.100.—Lieut. J. B. Lasher, taken prisoner unwounded.

1 triplane: 5457.—One Sec. Lieut. taken prisoner

2 triplanes: Their numbers and the names of the passengers were not ascertainable.

1 "Zanzibar" VII: 7714.—Passengers not ascertainable.

1 R.E.8. ?.—The passengers taken prisoners.

The numbers, and/or names of passengers of 32 French Avions, and Russian, are given in the same list.

* * *

The list of Allied aeroplanes which fell into the hands of the Germans during May, 1917, gives 113 machines in all: 89 British, 21 French, 1 Belgian and 2 Russian.

8 Sopwith Two-seaters.

B.1597.—Unknown.

A.8252.—Lieut. O'Brien and Lieut. Edwards, both taken prisoners.

? (Motor: Clerget 1259).—J. L. Pischott, wounded; F. H. Adams, killed.

7803.—Lieut. Nills, killed; Gunner Lengblan, wounded.

3552.—Lieut. F. H. Woolliam and Lieut. J. B. Harvey, both taken prisoners.

3a 963.—Sec. Lieut. Johnstone, wounded; Sec. Lieut. Thomas Snipson Millar, taken prisoner.

A.8226.—Allan S. Carey and William Arthur Laidranck, killed.

In one Sopwith two-seater the number and the names of the passengers could not be ascertained.

21 Sopwith Single-seaters.

N.6186.—Lieut. Arthur Stuart Nather, taken prisoner, unwounded.

R.W.72.—H. S. Morton, taken prisoner, unwounded.

?.—Lieut. R. M. Musters, killed.

6174.—Lieut. Hadrill, taken prisoner, unwounded.

A.7303.—Lt. D. T. Sheehan, killed.

A.6178.—Lieut. H. Thomas Wicket, severely wounded.

N.6464.—Lieut. J. Bampfylde, taken prisoner, unwounded.

Motor: Gnôme-le Rhône, No. 100221.)—British Sergeant, without identity sign, killed.

A.6776.—Lieut. Gilchrist.

(Motor: Le Rhône, 7980.)—The pilot killed.

B.1721.—Lieut. F. N. Kantel, taken prisoner.

(Motor: Le Rhône, No. 100235.)—Lieut. R. M. Roberts, taken prisoner.

? (Motor: le Rhône, No. 2764.)—Sec. Lieut. Sutherland, taken prisoner.

A.6158.—N.C.O. Walker, taken prisoner unwounded.

A.6186.—The name of the pilot not ascertainable.

A.6194.—Capt. Lucas Smith, wounded.

?—Lieut. Hains, killed.

A.2 8902.—Lieut. Toogood, wounded.

A.6186.—Lieut. Charles Smith, taken prisoner.

In 2 single-seaters the numbers of the machines and the names of the pilots were not ascertainable.

1 Sopwith Triplane Two-seater.

7419.—Sergt. Walter Bond, Lieut, T. Welby, both killed.

7 Sopwith Triplane Single-seaters.

5474.—Lieut. Roach, killed.

(Motor: Hispano-Suiza, No. 10046.)—Capt. Ball, killed. (One doubts if it was a Sopwith of any kind.)

A.973.—The pilot killed.

(Motor: Clerget No. 386.)—The pilot killed.

N.5450.—Smith killed.

(Motor: Clerget No. 1597.)—The pilot unknown.

(Motor No. 2779.)—The pilot unknown.

14 F.E. Two-seaters.

?—Lieut. G. French and Lieut. Hording.

A.5149.—First Lieut. Arthur W. Martins, Gunner Private Blakes, both taken prisoners.

?—M. Kaiser wounded.

?—Lieut, Lee and Gunner Boomeister, both taken prisoners.

(?) 5.—The passengers killed.

A.6446.—Lieut. E. James Grout and Alex R. Tyrell, taken prisoners.

A.6447.—Lieut. B. C. Moody, Sec. Lieut. F. D. Blakall, slightly wounded.

5511.—Lieut. Thomas Hudson and Capt. L. M. Horncastle, both killed.

9524.—Lieut. Johns, severely wounded; and Sergt. Alfred, killed.

?—Lieut. F. W. Evans, and Lieut. Masson, both killed.

A.7374.—Lieut. Holman, severely wounded, the second passenger killed.

A.6378.—The names of the passengers unknown.

A.32.—The names of the passengers unknown.

In 1 F.E. biplane number and passengers not ascertainable.

F.E. Single-seater.

2622.—The pilot severely wounded.

10 Nieuport Single-seaters.

B.1514.—The pilot taken prisoner.

A.6665. Sergt. Henri Dunb (?) taken prisoner.

A.6644.—Sec. Lieut. S. H. Lines, taken prisoner unwounded.

2942.—Lieut. Raymund, taken prisoner.

3761.—Lieut. Cole, killed.

A.6678.—Lieut. R. J. Anthony, killed.

(Motor: le Rhone, No. 6284).—Lieut. Mackintosh, prisoner.

A.4.—Lieut. Robertson, taken prisoner.

In 2 Nieuport biplanes numbers and pilots not ascertainable.

6 B.E. Two-seaters.

4968.—The passengers killed.

A.2801.—Both passengers killed.

(Motor: Rolls-Royce 3243.)—Lieut. Brisel and Sergeant Adam, killed. (Probably not a B.E.)

3474.—Lieut. Osborne and Sergt. Lewis, taken prisoners.

(Motor: Rolls-Royce, No. 4260-146.)—Lieut. Rozer Palner Percy and Lieut. Edward Seffery Roland, killed.

In 1 B.E. biplane number and passengers not ascertainable.

2 Bristol Single-seaters.

B.5/2515.—The pilot killed.

(Motor: Hispano-Suiza, No. 10020).—Lieut. G. B. Daniell, taken prisoner unwounded.

3 Vickers Two-seaters.

(Motor: Rolls-Royce).—Sec. Lieut. Bacon, wounded; Lieut. Committio (?) killed.

A.3608.—Lieut. Harold Kirby and Lieut. Thomas Wade, taken prisoners.

A.6410.—The passengers unknown.

2 Vickers Single-seaters.

7622.—Lieut. Fraser, taken prisoner unwounded.

4873.—Captain S. F. Browning, killed.

2 Spad Two-seaters (?).

N.B.— 1588.—Lieut. John Duncan and Lieut. Vernon Holmes, both taken prisoners.

B.1627.—Sec. Lieut. Stanley Franck and Allobarton, both taken prisoners, unwounded.

3 Spad Single-seaters.

5280.—First Lieut. Cecil Ernst French, taken prisoner, unwounded.

In 2 Spad single-seaters the numbers and names of pilots were not ascertainable.

2 S.Es.

734.—Lieut. Hume, taken prisoner.

A.8905.—Lieut. Edgar A. Lloyd, wounded.

1 R.E. Two-seater.—Lieua.— Ernst Moore and Lieut. William Winkler.

1 Farman (?) (Motor: Beardmore No. 4425).—Passengers unknown.

1 de Havilland Scout.—J. H. H. H. Godall, taken prisoner, unwounded.

1 Tractor Biplane: A.7416.—Sec. Lt. Beavanto Pill and Sec. Lieut. G. S. Stroboyde (?), both killed.

3 British Aeroplanes (Motor: Beardmore 1411).—Mechanic Echens; the second passenger unknown, both killed.

The numbers of the two others and the names of their passengers not ascertainable.

This list gives also 21 French avions, which include 10 Spads, 7 Nieuports, 1 Sopwith single-seater, 1 Morane parasol, 1 Paul Schmidt biplane, 1 Moineau biplane, and 1 Voisin.

* * *

The "Daily Express" published on July 28th a list of British air losses in June which was published in the official "Norddeutsche Allgemeine Zeitung," of Berlin. The total number of machines mentioned in 83. The list is as follows:—

4 Sopwith Two-seaters.

...No. A.1012.—Lt. R. Neill, Lt. S. N. Harley, both dead.

(Motor Clerget) No. W.D.6291.—Occupants dead.

No.A.8280.—Lt. Smith, Cpl. Thowsen, both prisoners.

No. B.1750.—Occupants unknown.

22 One-seaters.

No. B.1583.—Sec. Lt. Stewardson, prisoner.

No. A.6204.—Lt. David Cameron, prisoner.

No. 4632.—Occupant dead.

No. 9625.—Occupant dead.

(Motor Clerget) No. 1293 R.—Occupant dead.

(Motor Wolseley Hispano, 684/2233).—Capt. T. Malcolm Dickenson, wounded.

No. A.1566.—Douglas D. Steeves, wounded.

No. 5025/1252.—Occupant dead.

(Rotary engine) No. 35021/4694.—Lt. Chalmers, prisoner.

No. A.8899.—Lt. Harold Hamer, dead.

No. B.1730/1439.—Major C. E. Sutcliffe, dead.

No. A.7306.—E. Y. J. Grevelink, dead.

A Blizzard-Proof Coat

Designed by expert flying men, and made in the Burberry material chosen by Sir Ernest Shackleton for his Polar expeditions, The

BURBERRY AIR-WARM

provides a lightweight, yet warm and dependable, defence against piercing winds, downpours of rain and saturating mist.

The inside is of luxuriously soft, thick Camel Fleece. The coat is workmanlike in every detail, and has nothing about it to catch in any part of the machinery.

Its two parts can be worn separately or together—the outside alone providing a Weatherproof that excludes anything in the form of wet; the Fleece lining, a smart British Warm; and the two together the staunchest safeguard possible for facing the most severe atmospheric conditions of varying altitudes.

Naval or Military Catalogues Post Free.

Every Burberry Garment is labelled "Burberrys."

Complete R.N.A.S. and R.F.C. Kits in 2 to 4 Days or Ready for use.

BURBERRYS Haymarket S.W.1 **LONDON**

Rotax

Makers of Aeroplane fittings to Manufacturers' Details and to A.G.S. drawings

Oil and petrol fillers, pressure pumps, petrol filters, taps and brass and G.M. fittings generally, water joint clips, press buttons, turn buttons, shackles, and small parts.

Write for illustrated booklet, now in the press.

STREAMLINE WIRES AND FITTINGS.

Orders will be dealt with in strict rotation.

Unscrewed wires can be delivered within 7 days.

The Rotax **Motor Accessories Co., Ltd.,**
Willesden Junction, London, N. W. 10.

P.C.R. 1

No. unknown.—Lt. March, prisoner.
No. A.6207.—Sec. Lt. Robertson, dead.
No. B.1745.—Sec. Lt. Shirley, dead.
No. 6362. Lt. F. W. Smith, dead.
No. A.8919.—Lt. Rogerson, prisoner.
No. unknown.—Lt. R. Illis, dead.
No. B.V.H.—A. Iondes (?Ionides), dead.
In the case of three of the Sopwith one-seaters the numbers of the machines and the names of the occupants were undecipherable.

1 Sopwith Triplane Two-seater.

No. 6293.—Occupants dead.

5 Sopwith One-seaters.

(Motor Clerget).—Lt. Parker, dead.
No. N.6306, L.A.T.—Lt. Holcroft, wounded.
No. 5358.—Lt. Girling Robert, dead.
No. 5376.—Lt. G. Nash, wounded.
In the case of one Sopwith triplane the number of the machine and the names of the occupants were undecipherable.

20 Nieuports—One-seaters.

No. A.6675.—Sec. Lt. F. Darrie, prisoner.
No. 3491.—Lt. Waters, prisoner.
No. B.1548.—Occupant unknown.
No. 3204.—Lt. F. P. Reeves.
No. unknown.—Lt. Shaw, prisoner.
No. B.1674/3453.—Occupant unknown.
No. 2900.—Lt. Boote, prisoner.
(Motor Rhone) No. 7494.—Sec. Lt. Slee, prisoner.
No. B.3481.—Occupant wounded.
No. B.1550.—Lt. Mussared, prisoner.
No. B.1689.—Lt. Anderson, dead.
No. 3443.—David Rhys Cadwgan Lloyd, dead.
No. 1680.—Lt. George Carman Aiknis, prisoner.
No. B.3495.—Jerrat, prisoner.
No. unknown.—Sec. Lt. G. T. Harker, prisoner.
No. B.1607.—Lt. Smith, dead.
No. B.1572.—Sec. Lt. Bird, dead.
No. A.6718.—Lt. D. C. G. Murray, prisoner.
In the case of two Nieuport one-seaters the numbers of the machines and the names of the occupants were undecipherable.

7 Spads—One-seaters.

No. A.6157.—Lt. A. J. Mitschel (sic), wounded.
No. B.1524.—Lt. Illingworth, wounded.
No. B.3460.—Sec. Lt. Count L. T. B. di Balme.
No. B.3504.—Capt. Davids, prisoner.
No. B.1663.—Lt. Maurice Lowe, dead.
In the case of two Spad one-seaters the numbers of the machines and the names of the occupants were undecipherable.

2 F.E. Two-seaters.

No. B.1.A.857.—Capt. F. P. Don, Lt. Harries; both prisoners.
No. unknown.—Lt. Pollard, wounded; Lt. Ferriman, dead.

4 One-seaters.

No. 4887.—Lt. P. E. Stacpole O'Longan, dead.
No. unknown.—Occupant Hair, prisoner.
In the case of two F.E. one-seaters the numbers of the machines and the names of the occupants were not decipherable.

4 R.E. Two-seaters.

(Stationary motor).—Lt. C. W. Devenish, Lt. H. S. R. Cottenil (sic), both dead.
No. unknown.—Lt. Philipp, dead; second occupant not found.
In the case of two R.E. two-seaters the numbers of the machines and the names of the occupants were not decipherable.

2 One-seaters.

Two R.E. one-seaters, in which the numbers of the machines and the names of the occupants were undecipherable.

5 S.E.—One-seaters.

(Rotary motor), No. 4858.—Occupant dead.
No. 4862.—Lt. Spearpont, prisoner.
No. A.8922.—Occupant, prisoner.
No. A.C.3.—Lt. W. Turner-Coles, prisoner.
In the case of one S.E. one-seater the number of the machine and the name of the occupant were undecipherable.

3 B.Es.—Two-seaters.

No. A.3162.—Lt. Bowe, dead; Lieut. Lister, wounded.
No. 24522.—C. B. Lt. O'Brien, dead; Sergt. Mollison, prisoner.
No. 2800.—Lt. Fred Vipon, Lt. George Simon, both prisoners.

1 Vickers—One-seater.

No. A.4925.—Lt. Sturgess, prisoner.

1 D.D.—Two-seater.

(Motor Rolls-Royce), No. 4250147.—Cpl. Thomson, Lt. Smith; both dead.

1 Martinsyde—One-seater.

No. unknown.—Sec. Lt. Stures, prisoner.

1 de Havilland—Scout.

No. uncertain.—Capt. of the 25th Squadron, burnt to death.

* * *

During the month of June Sir Douglas Haig, in his official reports, recorded the bringing down of 101 German aeroplanes, and that a further 76 were driven down out of control.

It should be noted that these names and numbers above represent actually the machines in the hands of the Germans, and take no account of machines crashed, or of aviators killed or wounded on our own side of the lines.

IN MEMORIAM.

When I heard that he was dead, I was stunned.

When I heard what he had done before dying, I was proud.

When I thought of what he had been to me while he was still alive, I was glad.

Death is a commonplace.

As surely as we were born, so surely must we die.

He was young; he was clean; he was strong.

He lived his life—short as it was—to the full.

Who am I to regret a glorious end to him who was my friend?

Yet I am selfish: I want to see him, to hear his voice, to watch his face light up as he sees me.

Certainly, I am foolish.

He is gone into the Unseen, where I shall one day follow him and the more willingly because he has gone before me.

I am lonely without my friend, he had my confidence.

He knew my faults and loved me the better for them.

My thoughts were all of him, and of how I could make him happy.

But now I cannot make him happy, and whether he is happy, I do not know.

I am rebellious, but I am impotent.

Death has defeated me of my friend, but it cannot wipe out the memory of our friendship.

And when I die, shall I not see him again?

Who knows? Who really knows?

When I heard he was dead, I was stunned.

When I heard what he had done before he died, I was proud.

When I thought of what he had been to me while he was still alive, I was glad. H.

WAR WORK.

The Ministry of Munitions has shown its appreciation of the training school for women welders at Notting Hill Gate, which was organised by Women's Service, 58, Victoria Street, S.W.1, by taking over all payments and expenses in connection with it. The Ministry will not interfere with the running of the school, which is acknowledged to be the best of its kind, nor with the selection of the pupils and their subsequent placing. The Ministry took this step as the result of an inspection of the school, when it was found that, not only were the pupils, all educated women, better taught, but that the school was run more economically than those already under the control of the Ministry. As it was the desire of the Ministry that the training should not be charged for, and as the Women's Service could not afford to give it free, the Ministry undertook all charges on conditions that 20 pupils should be constantly in training.

The new arrangements are working well. The Ministry have added new blow-pipes and plant, and the securing of sufficient oxygen, acetylene gas, and scrap metal is no longer a difficulty. About 200 skilled welders have been trained in the school, which has already been described in the "Times." When trained they receive a wage of 8d. an hour, and after three months the men's minimum rate, which gives them an average of £2 10s. to £3 a week.

Aluminium welding is also being taught with success. It is difficult, but the women are doing well in aeroplane factories. The students are booked two or three weeks ahead of the completion of their training.

R.F.C. STAFF BADGES.

The following distinctions in dress have been approved for Staff officers of the Royal Flying Corps:—

Gorget patches.—French grey cloth with line of crimson gimp and small Royal Flying Corps button.

Cap-band.—Band of French grey cloth to be worn with the forage cap of the Royal Flying Corps. A cover of drab material to be fitted to the forage cap so as to show the badge, band, and peak.

Godbolds.

AIRCRAFT IN THE HOUSE.

On July 17th, **Mr. G. Faber** asked the **Chancellor of the Exchequer** whether the Commander-in-Chief in this country, or who, was primarily responsible for the safeguarding from treacherous tampering by persons living in this country with military airships and aeroplanes situated or operating here; and whether, in view of the ever-increasing importance of this branch of the air service, he would consider the desirability of some official or officer being forthwith appointed whose chief duty it should be to see that no possible precautions were omitted whereby such treachery could be guarded against.

Mr. Macpherson (Ross and Cromarty, L.), who replied, said: General officers commanding-in-chief commands are responsible under the direction of the Field Marshal Commander-in-Chief, Home Forces. It is not considered necessary to make any alteration in the system such as my hon. friend suggests. **Mr. Pemberton-Billing**: As this is a very grave and serious matter, which has caused considerable dissatisfaction, will the hon. Member at least ask the Department to give it very serious consideration? **Mr. Macpherson**: I can assure my hon. friend and the House that the War Cabinet and the Committee over which the Prime Minister presides will make the necessary inquiry. **Mr. G. Faber**: May we be assured that the report will come in time, and not too late? (Hear, hear.) **Mr. Macpherson**: I hope so.

[It would be interesting to know how this absurd yarn about someone having tampered with machines originated. One is almost tempted to think that it came from some aviator or other who did not quite relish the idea of going up to attack raiders and came home in a hurry with this excuse.—Ed.]

Mr. H. Samuel (Yorkshire, Cleveland): Are we to understand that the Committee which has just been mentioned by the Under Secretary for War, and which is presided over by the Prime Minister, is a Committee which will inquire into the matter mentioned in this question, or is it the Committee already announced that is to inquire into the air defences of London generally? **Mr. Macpherson**: It is an inquiry into the defences of London, and, I understand, into such other matters as are germane.

Aerodromes (Employment of German Prisoners).

On July 20th, **Mr. Billing** asked whether German prisoners are being employed at an aerodrome as mechanics or in any other capacity? **Mr. Macpherson**: German prisoners are being employed on the construction of aerodromes, etc., and not otherwise. Their employment has been found necessary in cases where free labour is scarce or difficult to procure, in order that the completion of these urgent works may not be delayed.

Mr. Billing: Is the hon. gentleman aware that in aerodromes throughout the country—I put several names in the question which do not appear—these German prisoners are employed, and in aerodromes which are actually engaged in the defence of this country, and will the machines have to be used—— **The Speaker**: The hon. Member is now making a statement. **Mr. Billing**: May I ask whether the hon. gentleman is prepared to issue an immediate order to remove all German prisoners, and all Germans, from the precincts of aerodromes in which Home Service Defence machines are stationed?

Mr. Macpherson: I will have that matter very carefully considered, and will place my right hon. friend's representations before the military authorities. But I should like to say that my information is quite definite that no German prisoners are employed in existing aerodromes. They are employed on construction work. **Mr. Sherwell**: Will the hon. gentleman make special inquiry as to whether, as a matter of fact, German prisoners were not employed in the grounds of a special aerodrome near London last Saturday? **Mr. Macpherson**: I shall certainly do so.

On July 24th, in answer to **Sir H. Dalziel, Mr. Macpherson** said: Telescopes are provided for the purpose of identifying aircraft. None of our machines were shot down by our guns on July 7th.

Mr. Bonar Law, replying to **Col. C. Lowther,** who asked whether the Government could form any estimate of the monthly output of aeroplanes in Germany, and whether they were keeping pace with that output, said: The answer to the first part of the question is in the negative. As regards the last part of the question, it is not so much a question of keeping pace as of producing machines in the greatest quantity possible.

Col. Lowther: Are the Government satisfied that there are sufficient aircraft in this country to prevent a repetition of what occurred the other day? **Mr. Bonar Law**: The Government are satisfied that they are doing everything in their power to meet all possible needs. **Mr. Lynch** (Clare, W., Nat.): Is the right hon. gentleman aware that Germany is abandoning the construction of Zeppelins in order the better to concentrate on aeroplanes? **Mr. Bonar Law**: I don't see what difference that makes. If we are producing all we can we cannot, whatever the Germans do, produce more.

[Doubtless "varra humorous" from Mr. Law's point of view, but not in the least convincing to those who know how much more we might produce if we went the right way to work.—Ed.]

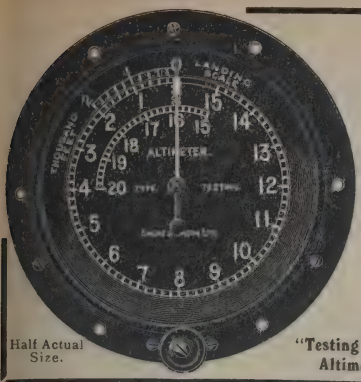
Mr. Rowlands asked, whether, in the evidence given at the coroner's inquest at Dartford on Lt. Salmon, who was killed in the air raid on July 7th, reference was made to an aviator who was shot in the neck and killed in the previous air raid, how did this occur, and was there any reason why this man's name should not be known?

Mr. Macpherson said that First-class Mechanic James O. Jessop was killed in action during the air raid on July 4th. His name appeared in the dispatches for gallant and distinguished service in the "London Gazette" published on July 18th.

Number of Raids.

On July 25th **Mr. Macpherson,** replying to **Mr. Billing,** said: Since the outbreak of war 47 airship raids and 30 "heavier-than-air" raids have taken place in this country. No official communiqué was published in the Press with regard to the first six airship raids, up till the middle of May, 1915. Press reports of the fullest character were, however, published. After the middle of May Press reports were forbidden. With regard to the seven following raids, up till the middle of August, Admiralty communiqués were published. The next seven raids, till the end of 1915, were published through Press Bureau reports. The remaining raids, from the beginning of 1916 till the present time, have all been published by means of official military reports issued by the War Office or the Field-Marshal Commanding-in-Chief, Home Forces, with the exception of one in which an airship is doubtfully reported as having appeared only for a few minutes over the coast and dropped no bombs. Of the "heavier-than-air" raids, the first two in 1914 were published by means of official communiqués. During the first half of 1915 no official communiqué was published in the Press with regard to the two raids that occurred, but full Press reports were allowed to be published. The only other raid that occurred in 1915 was published in an Admiralty communiqué. The remaining raids in 1916 and 1917 have all been published in military communiqués so far as they concern the sphere of action of the Field-Marshal Commanding-in-Chief, Home Forces, and wherever the enemy's activity has actually extended over land.

Mr. Macpherson, in answer to another inquiry by **Mr. Billing,** said: I am informed that the total casualties among soldiers, sailors, and civilians caused by the raid of Sunday, July 22nd, were:—Killed, 13; wounded, 26. None of our own aviators was brought down by the enemy or crashed in any manner whatsoever. None of the enemy aircraft was shot down or brought down in this country.



Sir G. Cave (Surrey, Kingston), replying to **Mr. Gilbert** (Newington, W., L.), who asked what form of warning against air raids in London had been decided on, said: Warning will be given by signal rockets to be fired from certain Fire Brigade stations and police stations, as already announced. As a result of the experience gained last Sunday, it is proposed to reduce the number of signals to be fired at each station from three to two, and also to give a signal by whistle or otherwise when all is clear. A police notice will be issued forthwith.

On July 26th **Sir H. Dalziel** (Kirkcaldy Burghs, L.), answering **Sir G. Cave** (Kingston, Surrey), said: I am in consultation with the Admiralty and Army Council as to the desirability of taking steps under the Aliens Restriction Order for prohibiting any alien enemy from residing in the vicinity of an aerodrome, but such prohibition (if issued) would affect aliens only and not British subjects of enemy origin. These persons, if they are suspect, can be removed from any area by order of the naval or military authority under Article 14 of the Defence of the Realm Regulations.

On July 30th **Sir G. Cave** (Kingston, U.), responding to a request made by **Sir S. Coats** (Wimbledon, U.) that he would supply the complete figures of those killed and injured in hostile air raids and in street accidents in the London metropolitan area from the commencement of the war to date, said: The figures are as follows:—Killed in air raids, 366; killed in street accidents, 2,412; injured in air raids, 1,092; injured in street accidents, 70,863. These figures include all persons killed and injured in air raids in the Metropolitan Police district and the City of London up to the present date. The figures of street accidents are given up to June 30th in the Metropolitan Police district and to July 22nd in the City of London, these being the latest dates for which figures are available.

Orders to Fly.

Mr. Macpherson, replying to **Sir H. Dalziel** (Kirkcaldy Burghs, L.), who asked whether, notwithstanding the importance of our aviators getting up in the air as speedily as possible on the approach of enemy machines, they were constantly kept below waiting for orders from a distant authority; and, if so, whether he would at once give instructions for the officers at the various aerodromes when a raid was in progress to act on their own initiative, said: The answer to both parts of my right hon. friend's question is in the negative.

The Vote of Credit.

On July 26th, the House went into Committee of Supply on the Supplementary Vote of Credit of £650,000,000.

The Chancellor of the Exchequer said:—I rise to move the Vote of Credit of which notice has already been given. The amount is £650,000,000, which exceeds by £150,000,000 the largest sum previously asked for in this House.

On the subject of aeroplanes he said:—

In addition, there has been a slightly increased expenditure on aeroplanes. This is due, of course, to this fact alone, that output has increased more rapidly than was anticipated at the time that the Budget was framed.

THE ALMS OF THE LAW IN CANADA.

(*Reprinted with acknowledgments to "Aerial Age," New York.*)

There was a time in Canada when a man engaged in aeronautical work was singularly immune from the law. In fact, it is related that Tony Janus, in the spring of 1915, used a Henry Special (Ford), to travel between Toronto and the Aerodrome of the "Canadian Aeroplanes, Limited." As Tony was always in a hurry he made the Ford travel its limit until one day he was reported for speeding. At one hearing he had *seven reports*, but the Judge, on hearing that Mr. Janus was engaged in teaching aviation, and building aeroplanes for the Allies, said: "We must be lenient to these fellows, as they are here to help us win the war." He dismissed the case. It seems that now the Canadian judges must have become confident of winning the war, as they refuse to forgive speeders any more.

The chief pilot of the Canadian Aeroplanes, Limited, Mr. Harry J. Webster, made a trip from Toronto to Buffalo the other day, and on the way through Burlington, Ont., was reported for speeding, and summoned to answer the charge. Mr. Webster inquired if he pleaded guilty, would he need to appear for hearing, and in answer to his letter received the following, absorbingly interesting, from the Police Magistrate:—

H. J. W. Burlington, Ont., May 7th.

Dear Sir,—Yours of the 4th before me. When you plead guilty you can settle without coming. My paper says you were speeding at 35 miles per hour. If it is the first offence the fine will be—Fine, $10.00; cost, $3.05 equals $13.05. If it is a second offence it will be $5 more. Please send an Express order

And Oblije

W. J. Barr, P.M.

(*P.M. means Police Magistrate, not Post Meridian.*)

FAIR CRITICISM.

The Cologne "Volkszeitung" remarks with regard to American participation in aerial warfare:—

"Reuter is coolly spreading the information that the American Ministry has laid a proposal before the military committee of the Chamber of Deputies in favour of the immediate construction of 22,625 aeroplanes.

"One is really at a loss to comprehend the object of spreading such information. Can any cool, reasoning Frenchman take it seriously? Just imagine a miserable trifle of 22,625 aeroplanes—mind the odd five. Who is to build them, we should like to know; whence are the practised pilots to be found for so many machines?

"It may readily be admitted that Americans will do their best to help their terribly distressed allies, but even the Yankees will not be able to manage things so quickly as this.

"So far as the German public is concerned, the Americans and the English may keep such childish tales to themselves. The Germans are much too cool-headed to be taken in by them."

A USEFUL FLYING ACCESSORY.

The problem of writing notes in the air has not been in the past so simple as such an automatic operation would appear to be. In the first place, even for a passenger, who has nothing particular to distract his attention or employ his hands in any other direction, the matter is one of considerable difficulty, even in a machine which is well protected from the wind, and writing materials are apt to be disturbed. Also, in the average aeroplane, there is no particular place where a writing-pad can conveniently be kept, and as likely as not, when out of use, it will be placed on the floor of the machine, and may slide out of reach of the user and possibly into a puddle of grease.

As regards pilots, both of single and multi-seated machines, still greater inconvenience is experienced. As a rule, any writing slope provided does not suit the reach of every length of arm, and in any case it is rather extraordinary how few people can write legibly, even on the ground, with the use of one hand only, there being a curious kind of instinct to grab the paper with the other hand whether it is fixed or not.

For military purposes, the taking of copious notes is very necessary, and any device which will assist in this direction will be welcomed. The solution of the problem seems to have been solved very effectively by Mr. W. R. Turnbull, of Fredk. Sage and Co., Ltd., who has recently patented a device, the simplicity of which is probably the reason why no one has ever troubled to patent it before. The patent consists essentially of a writing-pad which is capable of being strapped onto the forearm. In practice, it is a writing-pad with an aluminium frame, the back of which is curved to conform with the shape of the human arm. As can be seen in the illustration, it is attached by a couple of elastic straps. The whole device is very light and takes no room in the pocket when out of use.

The Turnbull Note-Pad in Use.

The points claimed for this writing-pad are that it is worn where it forms no kind of obstruction to any portion whatsoever, it cannot be dropped, and the arm constitutes a firm support which can be held in any position most convenient to the writer, and it presents the outstanding advantage that, while in use, the wheel or control stick of a machine can be operated with the left hand.

Naturally, the use of this attachment is not confined to aircraft, and it presents great possibilities for motoring, navigating, surveying, and, in fact, in all kinds of outdoor work. One recollects a tragedy which happened many years ago to a well-known aeronautical engineer, who, while engaged on mining engineering in South America, dropped an ordinary note book containing the result of nine months' work, into the river. By something approaching a miracle this note book was picked up miles down the stream, but the incident was sufficient to make him appreciate the utility of Mr. Turnbull's invention.

The attachment has been placed on the market by Dunhills, Ltd., of Euston Road and Conduit Street, W., the price being extremely moderate, and its use is commended to all and sundry who are occupied with the different kinds of work specified above.

FOR AN INVALIDED OFFICER.

An editorial assistant is required on the staff of this paper. Much of the work will be out of doors, and pay will be arranged entirely according to the ability of the applicant. A knowledge of aircraft and keen interest in aeronautical subjects are essentials, and the ability to write literary English is desirable. Preference will be given to an R.F.C. officer invalided after active service. No journalists need apply.

THE PASSING OF A PIONEER.

An American aeronautical pioneer has passed away with the death of Mr. Tom W. Benoist, who was killed on June 14th in an accident on a tramcar. He was travelling to his office at Sandusky, Ohio, and, on approaching his destination, stuck his head out of one of the windows of the car. His forehead struck a telephone pole placed close to the track, and his skull was fractured.

Tom Benoist was one of the earliest aeroplane and flying-boat constructors in the United States, and many interesting machines were produced at his works and school at Sandusky. Some years ago he built several large passenger-carrying flying-boats, which were successfully used for sporting purposes. One of his latest efforts was a tractor biplane, with a sheet steel fuselage.

Tom Benoist was very popular in aeronautical circles in America, not only because of his work for aviation, but because of his genial personality and out-spokenness. He made many friends in this country during a short visit in 1915, and all who

THE FATE OF A DEPUTATION.

In reply to a telegram dispatched on July 18th at Tower Hill to the King, asking if His Majesty would consent to receive a deputation on air raids, and to deny the rumours as to alleged withdrawal of aeroplanes from London, the following telegram was duly received by Mr. Harry Biner, organiser of the People's Fairplay League :—

"In reply to your telegram of to-day I have to inform you that it is contrary to usage for the King to receive any deputation except on the advice of His Majesty's responsible Ministers. There is no truth whatever that any aeroplanes were withdrawn from London to give a display before His Majesty, or for any object connected with the King's visit to France.

"(Signed) "Stamfordham."

SAFEGUARDS.

On the occasion of recent raids powder and solid substances from unexploded bombs were found, and as their handling except under safeguards is attended by risk, the following directions drawn up by Dr. Sequeira, of the London Hospital, were issued for the guidance of the police and may be of public interest :—

(1) The removal of the powder from surfaces is best effected by a weak alkaline solution. One teaspoonful of bicarbonate of soda to a quart of water. Brushes should be used wet with such solution for brushing or dusting surfaces covered with the powder. If the powder can be washed down with a hose, this would suffice. The powder should not be mixed with ordinary dust, as it might be sent to a destructor and possibly cause damage. The explosive should be mixed with earth and buried. Where much of the material has to be removed, it would be best to consult the military authority on this point.

(2) It is better not to wear gloves to handle the powder, as the glove soon becomes penetrated with the powder, and the skin is more easily irritated. Moist rags are best employed to handle articles covered with the powder.

(3) If the skin of the hands is stained, an endeavour should be made to remove the stain at once with pumice stone and the soda solution. (One teaspoonful of bicarbonate of soda to a quart of water.)

(4) At the first sign of inflammation of the skin, i.e., small swellings containing fluid, and irritation, a doctor should be consulted.

DESECRATING THE DEAD.

A number of munition workers were summoned at Dartford yesterday for being in the unlawful possession of various parts of an aeroplane, and also a pilot's goggles and gloves. The case arose out of the air raid of July 7th, when Lieut. W. G. Salmon, R.F.C., was killed, and his machine fell near Dartford.

Capt. Herbert Sisons, Acting Squadron Commander, R.F.C., said the safety belt, which was taken from the pilot when he was removed from the machine, disappeared, and the gloves of the aviator were also missing.

Defendants said they took the things out of curiosity as mementoes.

The magistrates fined each defendant 20s., and the chairman remarked that he supposed they did not realise the seriousness of their offence.

A WAR INVESTMENT.

A prospectus is being issued which will offer to the public the new capital for the payment of the extensions of the business of Peter Hooker (Limited), manufacturers of aviation engines. The company, which was incorporated in 1900, has a share capital of £450,000, of which £150,000 are in Ordinary shares, 50,000 in Second Preference shares, and 250,000 in Seven per Cent. Cumulative Participating First Preference shares of £1 each. The company owns freehold land and buildings at Walthamstow covering an area of 26 acres, and employs over 1,500 workpeople, with a staff of over 250. Its present turnover is at the rate of £610,000 per annum, while its net profits for the half-year ended Jan. 31st last amounted to £34,000, or at the rate of £68,000 a year.

The £250,000 First Preference shares which will be offered to the public at 21s. 6d. per £1 share, are entitled, in addition to the Seven per Cent. Cumulative dividend (free of tax), to 25 per cent. of any surplus profits that may be distributed in any year up to a maximum of a further 5 per cent. dividend.

PRESENTATION AEROPLANES.

The Government of the Gold Coast have received a further sum of £1,500, subscribed by the Chiefs of Ashanti, for the purchase of a third aeroplane for presentation to the Royal Flying Corps.

A LONDON REPRISAL MEETING.

A meeting of the townspeople of Stoke Newington to demand air reprisals against the Germans has been arranged to take place in Clissold Park on August 2nd, at 7.30 p.m.

The Mayor, Mr. H. J. Ormond, will take the chair, and the main resolution will be proposed by Mr. G. H. Jones, L.C.C.

A CORRECTION.

In last week's issue of THE AEROPLANE the list of prize-winners at the Aircraft Workers' Sports, at Stamford Bridge, stated that the three-mile cycle race was won by Mr. C. G. Turner, of Handley-Page, Ltd. This statement was not correct, and one takes pleasure in stating that Mr. Turner is employed at Integral Propeller Co., Ltd. He won both the half-mile and the three-mile cycle race. The cycle race was one of the most successful events of the day, and Mr. Turner won well from some very fine opponents.

ON THREE YEARS OF WAR.

Three years ago to-day we were all settling down to the idea that we were at war. Our fatuous Press correspondents were already sending back from the Belgian front stories of how the cowardly Germans were suffering at the hands of the brave Belgians. Our Fleet, thanks to Prince Louis of Battenberg and Mr. Winston Churchill, had already done the greatest thing it has done in the war—it had managed to be there before it was wanted. Our Expeditionary Force, the finest Army the world has seen since Cæsar's Legions, was on the point of embarkation. Our seaplanes, to all intents and purposes as good then as they are now, though less numerous, were already patrolling the Channel. And our comic though heroic little Flying Corps was preparing to fly the Channel with its weird collection of B.Es. with 70-h.p. Renaults, Blériots, and Farmans with 80-h.p. Gnômes, and its one or two Sopwith tabloids and Bristol bullets—five squadrons nominally, and something like fifty machines all told.

Compared with the German flying service, our air forces would have been a tragedy, but for the comic element. Before the war Germany had fostered aeronautics in every possible way. The German Emperor himself had given prizes for engine competitions. The German High Command had encouraged German officers to fly in competition with professional aviators, when our officials were forbidden not only to fly in competitions, but even to arrive at or start from public aerodromes when the mere mob was present.

Despite the elementary state of aeroplane and engine design, the R.F.C. authorities were already trying to standardise officially produced types, and were discouraging private enterprise in every possible way. Thanks to the Admiralty Air Department, urged by Mr. Churchill and Commodore Sueter, a competition for British engines was in progress when war broke out, and several firms, which would otherwise have expired, were encouraged to produce new and improved designs, chiefly in seaplanes. But even the R.N.A.S. was misled by its technical people, and so wasted much valuable labour and material on obviously useless types, both before and after the outbreak of war.

Germany, on the contrary, had encouraged private enterprise, had ordered aeroplanes in quantities from commercial firms, and had never attempted to establish an official monopoly of design. The German military aviators had been carefully trained in squadron flying, in photography, in reconnaissance, and, above all, in artillery observation. Consequently, when war broke out, Germany was able to supply aeroplanes which did their work adequately on all the fronts. They dominated the Russian front completely, and at least they held their own on the French and British front. They did not attempt to fight, but any soldier who took part in the fighting during the retreat from Mons will bear witness to the high efficiency of the German artillery control.

Every one of us who took any interest in military affairs knew for years before that this war was bound to come, yet the Germans were prepared and we were not. As a result, we have paid in blood instead of in brains for our lessons. Unfortunately, those who should have paid in brains are still with us, and those whose blood has paid for the sins of omission have gone from us. Still, we have learned a few lessons which may be useful in future.

Some of Our Lessons.

From a purely personal point of view it seems to me that the chief lessons of the past three years are that there is no room in the world for small nations, that democracy is a wash-out, that the biggest empire with the biggest air fleet will be the master of the world in the future, and that such an empire is the only possible guarantee of the world's peace.

Universal brotherhood is a wildly impossible dream till such time as it pleases the Creator to re-create the human animal. All predatory animals have their eyes close together in the front of their heads, their sole object being to see their prey. Their combativeness and speed of movement is their protection. There is no need for them to see sideways or rearward. Man, being the most predatory of all animals, has not even the need to move his ears backwards to listen for attack from behind. Only the peaceful animals grow their eyes wide apart in the sides of their heads, and pivot their ears in every direction. When man—as usual embracing woman—grows his eyes in his temples, and wags his ears so as to listen to every argument all round him without wanting to hit back, then we can hope for universal peace. And not till then.

Meantime the empire with the greatest military force at its command is the least likely to be attacked, and has therefore the best guarantee of peace. It is also the best guarantee of peace—both military and economic—to any of the small nations which it may have swallowed on its way to greatness.

The Useless and Dangerous Small Nation.

A small nation is a danger to itself and to its bigger neighbours. Holland and Denmark are actually suffering more from the effects of the war in a good many ways than are England and France. Belgium, Servia, and Roumania to-day, Greece in a less degree, and probably Bulgaria to-morrow, demonstrate the fate of small nations when their big neighbours disagree.

Belgium as part of France, with French conscription in force, might well have staved off the first German thrust just as that thrust was held up on the French Eastern Frontier, and so might have saved not only

herself but Northern France as well. And, to be perfectly impartial in what is purely philosophic argument, Belgium as part of Germany would have been saved the worst horrors of war which she has suffered, and would merely have been somewhat discommoded by our ineffective blockade, as the rest of Germany has been.

Servia as part of Austria would have escaped invasion and annihilation, and would merely have contributed her men and her pigs to the common cause. As part of Turkey she would have been in the same boat. As part of an Italian Empire which embraced the whole Adriatic she would have been as adequately defended as the rest of Italy. And as part of a Balkan Empire under a strong Emperor she might have kept out of the war altogether.

Greece, also, as part of such a Balkan Empire might have remained at peace, instead of being a mere pathway for the warring Powers. As it is, Greece has suffered, in the same way that Belgium has suffered, simply through being in the way, and not because of any personal animosity. Incidentally, it is time that someone did bare justice to King Constantine.

If one considers his position fairly, one sees that he acted throughout, as a gentleman should, in what seemed to him the best interests of his adopted people. If he had joined us at the start, Greece would have been over-run by the Central Powers, just as Belgium and Servia and Montenegro and Roumania have been over-run. If he had joined the Central Powers, we should have blockaded Greece as we have blockaded Germany, and we should have hammered all his ports to pieces, because the Central Powers could not have supplied Zeebrugge-Tirpitz-type batteries to all the Greek ports as well. As it is, Greece has been saved the worst trials of war for three whole years, which, after all, is not bad going.

Even from our own point of view King Constantine has not done badly, because so long as Greece remained neutral, and so long as the Central Powers respected that neutrality, Greece prevented our Salonika Army from being outflanked, just as Switzerland prevents the French right from being outflanked. Now that our left has presumably joined hands with the Italians in Albania, Greek neutrality does not matter, but it certainly was useful in its time. What would happen to Greece now if the Allies took it into their heads to cut their losses in the Balkans and clear out from Salonika, as some people in Parliament have advocated, is another matter which does not concern us. Presumably M. Venizelos and his friends would have an uncomfortable time from the Turks and Bulgars, and from the Royalist party in Greece. Which only serves to emphasise the disadvantages of being a small nation.

The Solution of the Irish Question.

The pity is that some of our Irish friends cannot see that point of view and realise the benefit of being part of a big empire, with local self-government. I fear that, in default of being taught by an enemy, as Belgium and Servia have been taught, we shall have to teach them ourselves, by the old and provedly effective methods of Strafford and Cromwell.

After all, the naughty child which is spanked into a state of exhaustion and is then put peacefully to bed lives a far more healthy life than the child which is allowed to sit up late just because it kicks and screams and is fed with sweets to keep it quiet, with ultimately ruinous results to its internal economy. And the former is far less trouble to the grown-ups in its vicinity.

It is all very fine for the British Empire to pose as the protector of small nations, and no doubt it is a noble part to play. I merely state my personal view when I say that small nations are a danger to themselves and everyone else. Also, quite possibly a small nation may not be worth preserving in any case, no matter whether it costs much or little to save it.

Saving the Undesirables.

The problem is rather like that which all these good people shirk who are organising "Baby Weeks" and "Save the Children" crusades. They never stop to think whether the children ought to be saved in the interests of the Empire.

I am told that there is an infantile death-rate of 8 per cent. in the East End. These good people do not seem to see that the East End is merely Nature's lethal chamber for the undesirable. The wasters of the nation gravitate to the slums, where their race mercifully dies out. If that 80 per cent. death rate could be reduced by "baby-saving" to 20 per cent., we should merely be increasing the criminal and diseased population by that 60 per cent.

The well-educated, hard-working classes cannot afford large families, because the money they would need to educate a number of children is taxed out of them to pay politicians and to pander to the mob. Consequently, if you save the mob's children, you ultimately produce a population which is entirely mob. And you produce in the end precisely the same condition which caused the break-up of the Roman Empire, when the

Front View of the "one-and-a-half strut" Sopwith (1915-16 type) with Clergêt Engine. In its day one of the most startling performers in the world, and a machine which continued to do excellent service long after its legitimate life was over.

solid middle classes had been squeezed out of existence by taxation between the upstart rich and the mob which the plutocrats tried to bribe into quietude.

What would happen to the canine population if we allowed all the mongrel pups to live and stopped breeding thoroughbreds? That 80 per cent. death-rate arranged by Nature corresponds to the mongrel-pup death-rate arranged by dog-owners. It is well to remember that Nature in all her manifestations is more ruthless than any Hun, whether in vegetable life, bird life, or animal life, and man is only a species of animal. A high death-rate among undesirables is a biological necessity.

All of which may not appear to have much to do with aeronautics, though in fact it bears on the subject very directly, and is all part of the lessons of the past three years.

A Parallel Case.

For example, those who advocate that the Flying Services should be combined into one service separate from the Navy and Army may do well to consider whether they would not be creating a sort of "small nation" which would be a nuisance to the two senior services and a danger to itself. It would probably be a wiser course to create one single War Department which would control Land, Sea, and Air Forces alike, each branch being separate in organisation of supplies, but under one administrative and operative head. This, at least, would be following out Nature's law that small separate forces must be combined in order to produce one great effective force.

Democracies.

Time was when every little baron had his own army and fought his neighbours. Then dukes arose who combined groups of barons. Then kings combined groups of dukes. And then emperors combined groups of kings. To-day we record the fact—"celebrate" is the word used by some papers—that we have been at war for three years. In the three years we have endeavoured to prove that several so-called democracies with the resources of the whole world behind them can crush one solid empire, *vide* the excellent map published by the "Daily Mail" on Saturday last.

Doubtless the German Empire will be crushed in due course, and deservedly so, but the fact that it has stood up solidly for over three years to the assaults of so many nations with such an immensely superior population is the best possible argument in favour of an organised empire as against disorganised democracy.

The greatest danger to civilisation in the future is that free and unfettered democracy may get the upper hand. We in England call ourselves a democracy, but that is merely political cant. As a matter of fact, we are at present a bureaucracy tempered by demophobia. And government influenced by fear of the mob is only one degree better than government by the mob.

France also calls herself a democracy but is in fact an oligarchy, for her successive Governments ring the changes on a few prominent Ministers time after time. Probably an intelligent oligarchy is the third best form of government, after a patriotic aristocracy and a benevolent autocracy. Which, coupled with the wonderful staying power, the true patriotism, and the great ingenuity of the French people themselves, doubtless accounts for France being the nation with the finest record in this war for military energy, warlike skill, and patriotic self-sacrifice. No matter how the war may end, no matter how France may be weakened by war, the French will go down to history as the greatest people of this epoch.

Mob Rule at Large.

If you desire to see democracy, mob rule, at its best and purest to-day, look at Russia. There you have government of the people by the people for the people in all its nakedness. It is hard to come by accurate news from Russia in these days, but gradually people are trickling back to more comfortable countries, and one hears a little of what is and has been going on. Some day certainly a new Carlyle will arise who will write the history of the Russian Revolution. I hope to live to read it, for apparently the French Revolution of 1790 and thereabouts was a mothers' meeting compared with the Russian effort. Russia is so much bigger than France, and the whole thing seems to have been done on a bigger scale.

In other ways the parallel is curious. The French Revolution also came in the middle of wars. The French Armies fell to pieces very similarly, and they were afflicted similarly with "commissaries" from the Revolutionary Government—of whichever party happened to be in power. The rising in La Vendée doubtless has or will have its parallel in Russia, possibly with other results.

A Slav Napoleon.

In fifteen years after the French Revolution, France under Napoleon the Great had conquered a Europe already weakened by continuous wars. But it was the French autocrat who conquered Europe, not the French democracy. History has a queer way of repeating itself,

The 1915-16 type Sopwith biplane, commonly known as the "one-and-a-half strutter." The reason for the name is that there is one pair of struts on each side of the fuselage, and a pair of half struts from the spars to the fuselage in the centre. The example shown above is arranged as a single-seater with a machine-gun firing through the propeller.

and it will be interesting to see whether or when a Slav Napoleon arises.

The Slav is, and always has been, even less capable of self-government than other races. An Ivan the Terrible or a Peter the Great had an easier job than a Cæsar, an Alexander, a Frederick, or a Bonaparte, for he had a less organised and educated people to use as his raw material. Being less educated, they were easier to drive.

A Still Useful Ally.

The Slav peoples may perhaps be got under control in time to finish this war in favour of the Allies. If the Russian armies retreat far enough into their own country, the Russian people may be driven to defend themselves. At any rate, so long as any Russian army exists, it will occupy a vast number of German and Austrian troops, and so will relieve the pressure on the French and Italian fronts. Even anarchistic chaos in Russia will prevent peace with Germany, and that will be so much to the good, for peace between Russia and Germany would mean the revictualling of Germany from the vast supplies of food in Russia which at present cannot be exported anywhither.

But even at best we must not reckon on Russia as an assistance in any great offensive, and so we must be prepared to see the war through on our own account, at any rate till next year. From which we may learn the useful lesson that any nation entering into a war must be prepared to fight to a finish on its own resources, irrespective of its allies, for the best of allies may collapse from internal causes, or be beaten by sheer fighting power.

Aerial Democracy.

All of which, again, has its parallel in the smaller world of aeronautics. To-day our aircraft supplies are under a species of democratic government in the Air Board. Every department, almost every individual official, issues its or his orders in the name of the Board, and the result has been a state of chaos not dissimilar from that prevailing in Russia.

It is said that only a few days ago one of the Board's few really capable technical men, one who has done splendid work during his short period in office, handed in his resignation owing to his plans being held up by reactionaries. Fortunately his resignation was refused, and his plans were confirmed by those still in power, but such incidents would never be allowed to arise under a proper system of organisation in which one strong man with full knowledge of his subject had control of the whole business. Nowhere is a benevolent and intelligent autocracy more necessary than in a munition supply department and nowhere is mob rule or amateur Socialism more dangerous.

The Succession of Hindrances.

In many articles in the past three years I have pointed out the harm done to output, originality of design, and progress generally by too much official control. At the beginning of the war we suffered heavily from the hampering influence of the Royal Aircraft Factory on British engine and aeroplane designs. Later we suffered from the mistakes made by the R.N.A.S. design department. Later again we suffered from the delays caused by the Aeronautical Inspection Department, with its impossible limits and qualifications. Later still we have been hampered by the control of supplies of material and machinery.

To-day new troubles are arising from interference with the buying of material, and the endeavour to centralise all buying in the hands of officials devoid of business experience or ability. Each evil in turn has reduced our output of aeroplanes, and each trouble should have been a lesson to us for the future.

In every case the underlying cause of trouble has been official refusal to recognise the fact that individual enterprise can always beat official performances, especially when the officials concerned are only in office because they have not enough ability to be worth more money in commercial employment. If Lord Cowdray will once recognise this fact, and will give experienced manufacturers a free hand to attain their maximum output, he will do a great good to the Flying Services, and will justify the exalted position which he now holds.

The Bright Spot.

The one really bright spot in the three years of war is the magnificent spirit maintained by the active-service aviators of both Services.

It has been alleged, by those who are to blame for what is wrong with our supplies, that agitation for improvements lowers the *moral* of those on active service because it decreases their confidence in the High Command. Such an argument may sound clever enough, but it is fallacious, and, moreover, it is an insult to the men on active service.

They do their work gallantly with such material as is given to them, and hope for something better, just as our men in the trenches in Flanders in the early days of the war hung on grimly without artillery, waiting for guns which eventually arrived after much agitation. The R.N.A.S. pilots have had splendid confidence in their immediate commanding officers all over the world, and the R.F.C. people likewise have hardly ever grumbled about their senior officers in the field.

In particular, nothing could be finer than the personal devotion of the R.F.C. in France to their G.O.C., and only such confidence in and devotion to their leader could have induced the pilots, observers, and gunners to carry on their work as they have done at periods when they have been utterly outclassed and outnumbered. The spirit infused by General Trenchard into the R.F.C. is worthy of the highest traditions of the British Army.

The Agitators.

It is, however, certain that the staying power of our aviators has been materially supported by the knowledge that there are always people at home whose one aim in life is to force officialdom to produce the best possible aeroplanes for both Flying Services. These people who work for improvement are of all sorts. Some work quietly by means of personal influence in high places. Some cry aloud on public platforms. Some speak gently in Parliament. Some write long or short, violent or subdued, articles in public prints. Some argue civilly in learned societies. Some indulge in personal abuse in clubs and other places where aviators congregate. Some pull strings. Some use sticks. All are lumped together by defaulting officialdom as agitators. All, in their degrees, are necessary evils, and all have served a useful purpose in producing more and better aeroplanes either by scaring the taxpayer or by perturbing the serenity of self-complacent and inefficient officials.

So among the lessons of the last three years is the fact that without agitation we should be much worse off than we are, and that until a reasonable approach to perfection is achieved agitation is necessary and will continue.—C. G. G.

THE PARLIAMENTARY AIR COMMITTEE.

At a meeting of the Parliamentary Air Committee on August 2nd, presided over by Mr. Joynson-Hicks, a number of resolutions were passed for transmission to the Prime Minister and the President of the Air Board. These dwell on the necessity for a great increase in both the personnel of the Air Service and the production of aircraft, and press for the unification of the Navy and Army Services under an Air Administrator, with adequate powers and full responsibility.

NAVAL AERONAUTICS AS SEEN BY AN AMERICAN.

BY "BERKELEY."

To the United States of America the honour belongs of having through the perseverance and skill of two of its citizens produced the first aeroplane to fly with sustained success. Through many generations a number of the more intellectual of those who inhabited the European continent whence sprang the malcontents who gave to Northern America a new chapter of history had dreamed of a day when human flight controlled and directed by the human brain would be possible. Theory and experiment alternated one with the other, but to neither came the joys of attainment.

From Leonardo da Vinci to Sir George Cayley, from Sir George Cayley to M. Ader, the science progressed but little, and the secret of flight partially understood through all this time was never subjected to practical revelation. Fortune, who had frowned on the graceful minds of the princes of civilisation, gave her truest help in this matter to an American engineer unknown to earlier fame or history.

America's Lost Opportunity.

So great is the reputation of nations successful in commerce that it might be imagined that the United States would have accepted the opportunity given by the favours of Fortune, and with continuous energy and skill would have led the way in the new science. In truth, commercial success breeds scepticism as to the use of all else in the world. Consequently to-day, not half a generation since the first flights were made in America, there are few nations less advanced in matters of aeronautics than is the newer Europe beyond the seas.

There were few incentives towards the production and development of aircraft. There was no immediate use for aeroplanes in commerce, and there existed no neighbouring naval or military rivalry strong enough to make necessary the formation of a large air service. Sport alone could do little. The aeroplanes of the day could satisfy all that the amateur required. And so initiative left the designers and the constructors, and another great opportunity was lost.

A Praiseworthy Effort.

Yet, despite this lack of enthusiasm and of appreciation, the United States was the first nation to give any degree of serious attention to naval aeronautics. Early in 1911 Congress set aside a sum of £5,000 for the formation of an aerial arm in the naval service. A station was organised near Annapolis, Maryland, and three naval officers were attached for duty. No other country had as yet even thought of the expenditure of any money at all on the actual provision of aeroplanes for their fleets.

It is therefore of interest to read a recently published work by a Mr. Henry Woodhouse, of the United States, entitled "Textbook of Naval Aeronautics," and dealing generally and lightly with the subject. Particular attention is paid to a minute description of the duties and habits of the Air Service of the U.S. Navy.

It is an ambitious work of some 288 quarto pages decorated by 300 illustrations. Descriptions of deeds performed during the present war alternate with theories as to the future development of the naval aeroplane. The book begins with a chapter on aerial strategy and tactics, and works backwards to chapters in which appear voluminous naval orders as to the mode of training and manner of life in the flying section of the U.S. Navy.

Obvious Limitations.

It is a description of the life and the duties of United States naval aviators rather than a textbook from which the youthful aviator might learn such things as are proper to the work he has chosen. For instance, "Aeroplane Guns and Aeroplane Gunnery" is dealt with in a chapter of less than 350 words, in which no description of any type of gun is given, and the Hotchkiss, often used by the French, is not even mentioned.

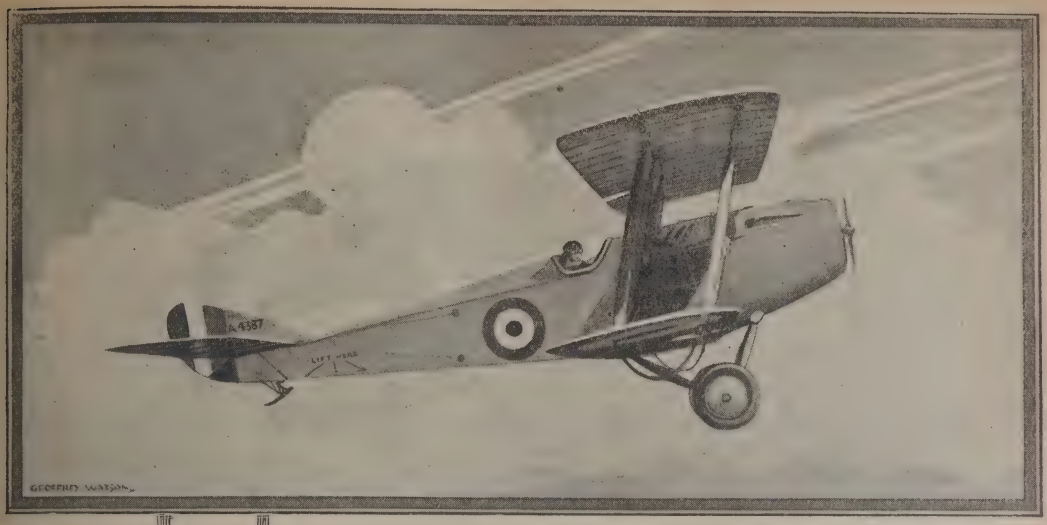
Observation for ships' guns has a chapter to itself, three-quarters of which is taken up by an extract from Admiral King-Hall's dispatch after the destruction of S.M.S. "Königsberg" in the Rufigi River, and no exposition is given of the attendant difficulties in this part of an aviator's duties.

In a similarly brief manner the author deals with such matters as radio-telegraphy, aerial photography, and bomb-dropping. In each case he emphasises the importance of the subject by an arbitrary statement, and devotes the remainder of the chapter to short anecdotes of incidents during the present war.

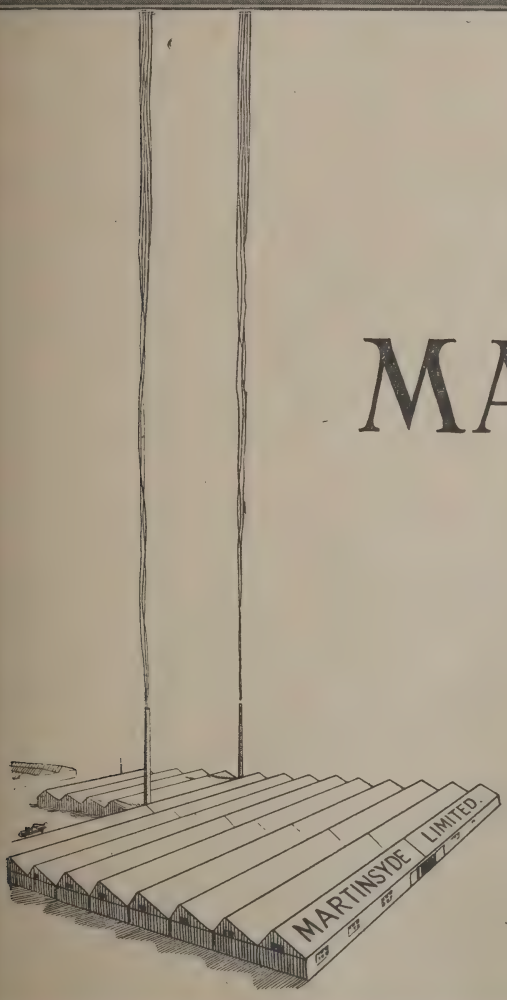
An Example of Ineptitude.

He talks of "night flying" in Chapter XXII. There is no part of military aviation which exceeds in practical importance this side of life, in either a naval or military air service, and yet Mr. Woodhouse gives no indication as to the peculiar difficulties of flying by night over water. He devotes his chapter to an account of Mr. Lawrence Sperry making a flight from Moriches to Amityville during the night of September 1st, 1916. This gentleman, it would appear, has designed a lighting set for use in aeroplanes by night.

The darkness is riven by a brilliant pathway of light from three 40,000 candle-power lamps which are attached charmingly to either the upper or lower plane, whichever may give greater personal pleasure to the aviator. He controls their movement over an extensive arc by means of a "knob fastened within easy reach of the pilot." That he does not describe the method by which the knob controls these lights is a sufficient indication of the manner in which this "textbook" is compiled.



One of the Useful Parts.



The only real value of the book lies in the information given as to the organisation of the aeronautical section of the U.S. Navy. Everything that can be learnt as to the formation or method of operation of any foreign air service is of value to those whose life is spent in flying in the King's Service. By the mistakes of others one learns almost as much as by one's own errors.

From the spring of 1911, when naval aeronautics began their history in the United States, the U.S. Naval Air Service remained at Annapolis until October, 1913, when an additional station was authorised at Pensacola, Florida. The three aeroplanes of the earlier station were replaced by many more, and the use of dirigibles and kite balloons was authorised. The U.S.S. "Mississippi" was extracted from her place of peaceful retirement in the Reserve Fleet for service as seaplane mother ship at Pensacola.

The Universal Brotherhood of Officialdom.

The committee responsible for the recommendations on which these extensions were based further submitted that an office of naval aeronautics be formed, "to be under the charge of a director of naval aeronautics with the rank of captain, if practicable, who shall co-ordinate the work of the office for the Secretary of the Navy in

conformity with the departmental organisation, and in co-operation with the necessary assistants representing the bureaus." Thus pleasantly is set forth the genesis of all things official!

The nucleus service formed in so tentative a manner was speedily put to a practical test. Mexico, usually closely occupied by the vivid complications of internal politics, for once turned its attention to the stranger within its gates, and was unpleasantly brusque with some citizens of the United States, and it was considered necessary to make a naval demonstration at Vera Cruz.

With the naval force sent to Vera Cruz in April, 1914, was the "Mississippi," with an aeroplane section on board. The Secretary of the Navy—he who suppressed intoxicating drinks in the national fleet—in a letter written to Mr. Woodhouse proudly states that within five minutes of the seaplane carrier having dropped anchor an aeroplane was flying over the Mexican coast. Then and for weeks afterwards a daily patrol of the coast was carried out, and valuable experience was gained. Effective opposition was lacking, and the lesson was therefore incomplete. But the present war will fill the gap in practical knowledge.

A Fair Arrangement.

All officers of the Navy and Marine Corps while "detailed for duty involving actual flying in aircraft," and qualified as naval aviators, receive the pay and allowances of their rank plus an addition of 50 per cent. This would appear to be a fairer method than that prevailing in the British Navy. The discrepancy in pay between officers performing the routine duties of the navy and those who are trained as aviators is less noticeable and is less unfair. A further regulation ordains that only 48 officers and 96 men of the Navy and 12 officers and 24 men of the Marine Corps may receive this extra pay at any one time Nor is any officer above the rank of lieutenant-commander or major allowed to draw such additional pay.

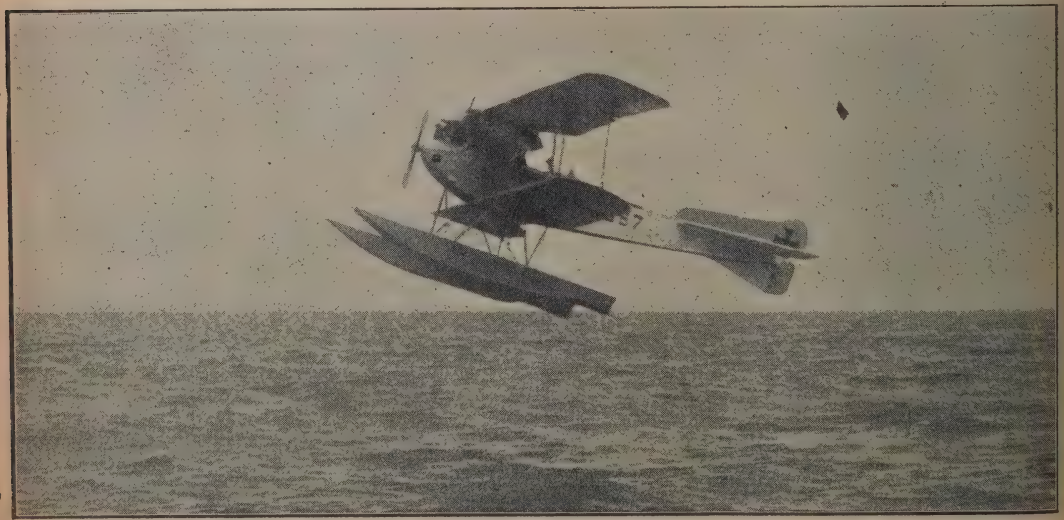
These regulations may have been modified in the Naval Bill of 1916, but Mr. Woodhouse does not give any information on the point.

Quaint Methods.

His, the author's, mode of describing the manners and customs of the Naval Air Service of his country is to print on many pages of his six-dollar work the detailed orders issued at many American air stations, including even such paragraphs as detail the occasions on which bathing dress may be worn on duty. He includes a two-page diagram of an ideal naval air station which resembles somewhat closely the drawings in a preliminary prospectus of an English garden suburb.

Many letters from cleverly initialled celebrities of the United States, and addressed to the author, are printed in full, even though their purport may be the conveyance of official thanks for some previous act of letter-writing.

The Pretty Pictures.



The book is heavily illustrated with photographs of flying in America and in the war area. Such photographs as deal with flying during the war are almost invariably inaccurately described. For instance, a photograph of the Castle of Tenedos, given on page 122, is described as one of Gallipoli taken from a height of 2,600 feet. Any aviator who would endeavour to photograph the latter town from so low an altitude during this present war would thoroughly deserve his consequent obituary notice.

A photograph of a cinema operator standing in a military B.E.2c is described as that of "a British naval aviator starting out to film a military observation."

But the mistakes are innumerable. The book, taken as fiction suitable for the young, has a certain degree of usefulness. As a serious contribution to the science of naval aeronautics it is entirely valueless.

Addendum.

[To which one may add that the paper is of the glossiest and the printing of the best, so that if one cannot compliment the author in any marked degree, it is, at any rate, possible to recommend the paper-maker and printer to any future American author who may contemplate producing a serious book on Naval or Military aeronautics. One gathers, however, from those expert in such matters, that these glossy papers, vulgarly and therefore erroneously known as "art papers," are so composed chemically as to disintegrate into fine dust within forty years. Perhaps, therefore, the serious historian will do well to choose paper of another species. For the work under review the forty-year limit seems excessive. —C. G. G.]

HEALTHY ZOOM.—A German seaplane just after leaving the water performing the operation colloquially known as "zooming," that is to say, carrying on upwards by its own momentum at an angle in excess of its possible climbing angle.

In the Defence of the Realm.

BY GEOFFREY DE HOLDEN-STONE.

Ten minutes to twelve. Of that particular midnight, if you please, which the new calendar calls the 24th Pluviose, Year the Second of the Republic One and Indivisible.

For one person at least, the last act is played. For a moment ago, in the presence of a numerous and variously distinguished audience, dumb with a common anxiety to know the full dénouement, best or worst, the Tribunal pronounced sentence.

Sentence of death, of course. When all are equal by law, some few thousand, to say nothing of one, can easily be spared.

So the actors, audience, supernumeraries and stage hands may each forthwith doff the mask of impassibility or wipe away a last tear and be done with it. Mechanically the court-assistant snuffs the candles. Here in this hall, which but a moment ago echoed with the clash of grounded arms, with high-flown eloquence, with curses and sobs, remains only a great silence. From without come the usual noises of a city not yet asleep: dulled certainly by the sodden fog, but sufficient, nevertheless, to return everyone's mind to his daily preoccupations, and—to forgetfulness. To-morrow; well, who has seen To-morrow?

To-night's play is done with, at any rate.

Therefore along chilly passages, by stairways damp with filth, under arches sweating with the fog, goes Claudin Valentin Millin-Labrosse, ex-captain of artillery of La Fère, led between two warders to the lower hall of registration—all other places of reception being just now inconveniently full—to await the dawn and the executioner. For the crime—as no doubt you heard, half an hour ago—of being concerned in scientific investigations; without doubt conceived against the safety of the Republic. And thus to pass the rest of the night of this 24th Pluviose, in the Second Year of the Republic that is one and indivisible.

For the decision of this Tribunal, where Fouquier-Tinville, prosecutor or provocateur-in-chief, is the invariable plaintiff, though there is a new defendant every hour or so, has prescribed the execution of the condemned within the next twenty-four hours after sentence. But Sansom is a busy man in these days: so as to save time and make sure, the custom now is to pass the condemned direct from the dock into his hands, unless the sentence happens to have been passed at night; in which case, of course, everyone concerned may as well wait for daylight. The Republic one and indivisible will be no less safe.

Thus Du Barri, the incomparable, condemned by candle light, had all the hours of the alone-merciful night, to weep and agonise in. That also will be the privilege of Claude Valentin Millin-Labrosse. . . .

But it seems that there is room for such a special prisoner elsewhere, after all. Behold him then, presently, in a cell at the Conciergerie, for the moment the solitary successor of so many others in that sinister place. And he is not wholly without material comforts. There is a pallet-bed of sorts, some brackish water at the bottom of a pitcher: a little straw—not very clean, it is true—on the tiles of this underground cell: and after all, some little fresh air can get beneath that big studded door. Whereas there might be none of these things somewhere else. As, for instance, in one's coffin.

Now that we are all at our leisure, to look at him, this Millin-Labrosse, soldier, scientist, and—it seems—conspirator against the liberty of the people. Only a little, rather plump man, prematurely bald, with a long moustache falling upon a sparse beard. Clothes, worn and shabby. Complexion, once ruddy with the wholesome life of camps no doubt: but now pale from months of preventive detention. Really he might be any one of a thousand. Precisely as befits a time when all men are equal, of universal brotherhood, and free to enjoy the absolute liberty, we see around us . . . So by the uncertain light of the miserable lamp that relieves the darkness of the cell, the condemned hastens to a little table, in the drawer of which he has managed to hide a little paper and a drop of ink; goes on his knees before it, and begins to write.

Now the letter of a living man who is going to be a dead one in five or six hours can hardly fail to be interesting. What thoughts then is that squeaking quill setting down? To whom are those last farewells going, supposing that some compassionate soul can be found willing to transmit them? It is already two o'clock in the morning; and everyone asleep in this lugubrious abode of equal and fraternal liberty, of which the blind river is licking the bastions, twelve feet thick. M. le capitaine C. V. Millin-Labrosse must pardon us, in the circumstances, if we look over his shoulder. . . .

Actually he is writing to Fouquier-Tinville! A last protest, a final appeal, perhaps? Nothing of the kind. Millin-Labrosse is a soldier still, and so accepts his fate as it may befall, past even the sentiment of resignation. So he merely writes.

"However imprudent . . . I did not expect to be treated as rigorously as I have been by your tribunal of the section of Equality. But of this I say nothing." Here it occurs to him that he has dated his letter in the customary manner, thus, "Conciergerie, Hall of the Dead," so he stops writing for a moment, blinded by helpless tears. Then little by little his face lights up and the colour burns feverishly on his thin cheek-bones, with the ardour of his theme, that makes him forget the imminent end of all things. So repeating *"Of this I say nothing,"* he continues.

"I will remark only that I am leaving behind me the model in cardboard of an aërostat which possesses the advantage of being steerable. I should therefore desire above all things to give to the Revolutionary Committee of my section, or even to two of its members, the explanation of the theory on which it has been built. Less than two hours would be enough for this purpose, and I should die no less within the twenty-four hours as ordained. There, citizen-impeacher, that is all I take the liberty to propose to you. I am resigned, I shall die resigned; I do not wish in the least to prolong my life uselessly, but I do maintain that this will serve as a useful memorial of me when this time of wrath has passed. . . .

P.S.—The Citizen Harny knew of my aërostat, and I now trust it to his knowledge, although he did lay the plaint concerning myself. I have no more paper. . . ."

So having written his letter, and signed it, presently he persuades the guardian of liberty—who appears to be a warder—to have it taken to the office of Fouquier-Tinville; who as the chief official defender of the Republic—by wholesale impeachment of her possible enemies—naturally must be housed in the most sumptuous building that can be found. No other than the Louvre hard by. His answer cannot be long coming. So, calmly enough, the ex-captain of artillery waits. . . .

Comes the dawn, sullen and wan. Slowly the abode of liberty, fraternity and equality awakes. Strange sounds penetrate it and grow louder. Harsh voices clash, die away, and repeat. Then the studded door opens, admitting Sansom and his assistants who approach the condemned man. The Citizen Fouquier-Tinville has evidently forgotten to reply. Or perhaps he thinks that so slight a matter does not matter. No less will the Republic remain one and indivisible. At any rate, while he remains with unlimited police-power to defend its unity and indivisibility of politics and purse against all innovators. What matters a mere Frenchman or two, more or less, or ten thousand such, as compared with that ideal? Certainly not any Claudin Valentin Millin-Labrosse. For whom, therefore, in half an hour nothing matters any more in this world.

But for France, and her people, what follows?

To be led, within another ten years, by her Man of Destiny, to find her soul in the wilderness of war. In years more of marchings and counter-marchings over the breadth of a continent, to make that soul great in discipline, great in conquest, greater in suffering, and greatest of all in defeat. And then for some forty more years to rest in untroubled self-possession.

Then for a while to steep herself and waste her strength in the depths of an utter materialism, lit as it were by a corpse-light of dead empire. And then suddenly to be called in her weakness to fight for her very life; yet to be most betrayed by those who should most have aided her against the new-risen spoiler of Europe. . . . Thus goes the lantern-show of France for a hundred years.

Yet how, in that day of her trial and agony, might not the wasted genius of this one of her sons, slain in her delirium, have saved her alive!

But—twenty years ago is all too late for a Hector Fleischmann to discover that letter long-buried in the National Archives. Too late for him to write: "Let modern science, still vanquished before the solution of the problem found by him who died beneath the guillotine of Pluviôse, Year Second, turn to the charnel-house of the Madeleine, choked with dead men's bones, and ask him for it. For the man whose last night of life was haunted with anxiety that his invention should be preserved for his country's need, who dreamed of a day when blind fury should no more prevail, lies there."

Too late. It is ever too late, when a people befooled by eloquence, entrusts its destinies to the rule of politicians and placemen.

For the nature of peoples, the working of destiny, and the rascality of politicians are three things that alter not with time nor place.

The Rue du Louvre and the Place de la Concorde are essentially the same as Whitehall and Northumberland Avenue. A century and a quarter has made no difference to the patient credulity of a people, its honourable capacity for being duped through its highest aspirations. And the trick of the politicians after having betrayed the liberty and safety of the people, t

bind them helpless in the name of the defence of the realm is exactly the same. As good as new, apparently. As potent for evil. But as it invariably precedes revolution, in thought if not in action, there is always hope that the nation will suddenly defend itself and its realities of right and liberty against the cloudy abstractions behind which hide—the politicians.

To-day we have no Fouquier-Tinville, though there is no lack of patriotic genius. We have, indeed, no man so snugly and individually responsible. Instead, we have Committees and Departments even more deadly than he to individual effort. And in three years we have suffered the creation of the most inept and dangerous collection of bureaucrats that ever existed.

COMPARATIVE LOSSES.

From the "Times" of August 7th :—

With the warning that exact details up to the end of February, 1915, and for July, 1917, are not yet forthcoming, so that the figures for these periods are not "absolutely trustworthy," the "Berliner Tageblatt" gives the following statement of enemy and German aeroplanes shot down during the three years of the war :—

	German.	Enemy.
1914	—	9
1915	91	131
1916	221	784
1917 (to end of July)	370	1,374

From August 1st, 1914, to July 31st, 1915, 72 enemy aeroplanes were shot down, of which 39 fell into German hands; from August 1st, 1915, to July 31st, 1916, 455 enemy aeroplanes were shot down, of which 267 fell into German hands; from August 1st, 1916, to July 31st, 1917, "about" 1,771 enemy aeroplanes were shot down, of which 776 fell into German hands.

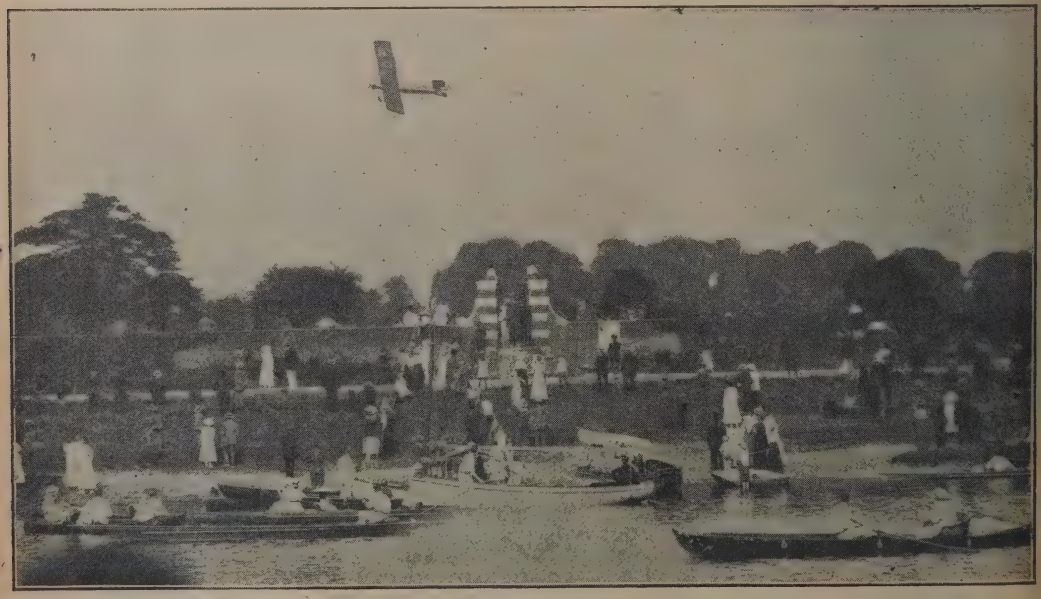
In 1915 two enemy captive balloons, so far as is known, were shot down; in 1916, 42; in 1917 to August 1st, 142. Three enemy airships were also shot down.

Total aircraft shot down from August 1st, 1914, to August 1st, 1917, about 2,298 enemy and 682 German aeroplanes, 186 enemy captive balloons, and three airships.

The "Times" remarks :—

Official figures are not accessible for the purpose of checking the claims made by the Berlin journal in respect of Allied aeroplanes, but it is possible to test, both from official and unofficial sources, the accuracy of the figures given of the German losses for at least some portion of the three years. For instance, the "Matin," whose authority is at least as high on the one side as that of the "Berliner Tageblatt" is on the other, stated on January 1st, 1917, that the French brought down 450 German machines in 1916 and the British 250. This figure of 700 compares with the German admission of 221. There is confirmation of this unofficial estimate in the table compiled from the statements in the official communiqués of British and French Headquarters which appeared in the "Times" of December 5th, 1916, and which showed that for the six months June to November in that year 666 German machines were brought, shot or driven down by the Allies. If we take the year 1917 as it is calculated by the "Tageblatt"—August 1st, 1916, to July 31st, 1917—the official British and French figures show that 2,076 German machines were sent down—1,325 by the British, 751 by the French. It is not pretended that all these were destroyed, but if we take, merely for May, June, and July, those which were officially stated to have crashed, to have been destroyed, brought down in flames, shot down by gunfire, or captured, we get, instead of the "Tageblatt's" figure of 370 for the whole year, 523 for three months.

[The probability is that the Germans admit only absolute *losses*, and if a machine crashes behind its own lines it is obviously not lost, even if its crew have "gone before." The figures may thus be compared with the British admissions of machines which "fail to return," or are merely "missing."—Ed.]



SERVICE STUNTING.

The following paragraphs from the "Times" of August 7th draw attention to a matter to which the High Commands of the Flying Services might well give attention :—

About the middle of the afternoon (Monday, August 6th) the crowd was given a thrilling display of airmanship by three British aeroplanes which came over the fair ground at Hampstead and spent half an hour in performing feats for the benefit of the earth-bound. They "looped the loop"; they took "nose-spins"; and they did a variety of other tricks which were not always recognised at first as the voluntary evolutions of daring men. But the most sensational feature of the exhibition was the amazingly low altitude at which they flew backward and forward.

A machine would swoop down until it seemed to miss the tree-tops only by a few feet and then with a great roar and at a terrific speed it would tear through the air just over the heads of the people—so low, in fact, that every spar and wire could be plainly seen, and one could even detect a small rent in one of the planes. It was all very novel and exciting, but there were some in the crowd who, while they admired the skill and pluck of the aviators, were inclined to doubt the wisdom of these perilous swoops over wooded and hilly ground swarming with people.

[There has been far too much of this silly stunting for a long time past. Aviators are trained and aeroplanes are built at considerable expense in order to be smashed up on active service. The young fools who perform in the manner shown in the picture below merely incur the contempt of experienced people concerned with aviation. As General Henderson was so keen on preventing R.F.C. officers from encouraging the "trade" by flying in public under proper sporting rules before the war, perhaps he will consider preventing his officers from performing like street mountebanks during the war.—C. G. G.]

HOW WE WASTE AIRCRAFT.—A snap-shot during the Thames-Ditton Regatta, showing England in War Time, with an aviator doing silly stunts over Hampton Court Palace, wasting petrol and endangering the machine, which is the nation's property. It would be interesting to know how many machines have crashed through their pilots showing off over crowds.

"Aircraft Supplies"

Our Fortnightly House Journal

NOTICE

Owing to the August Holidays, the next issue of "Aircraft Supplies" will not appear until Thursday, Aug. 16th. Special Stock Letters will, however, be sent to all Manufacturers and Storekeepers, giving prices and quantities of parts in stock for immediate delivery, on Saturday, Aug. 11th. Copies will be sent to others on request.

Published fortnightly, on alternate Thursday evenings, and issued FREE to the Air Services and to the Aircraft Industry (those in charge of Stores and other Works or Service Departments ONLY), on application to the Secretary.

Contains a complete LIST OF STOCK of Aircraft Parts up to the time of going to press, CURRENT PRICES, details of NEW ITEMS, ENQUIRY BUREAU, and other A.S.C. Announcements. A SHORT ARTICLE will also appear in each issue on a topic of interest to Aircraft Constructors.

Stock List contains over 400 items.

Send us a COMPLETE LIST of your requirements, and we will return this to you in course of post with the prices marked against those items we can supply FROM STOCK, or deliver quickly.

A.G.S. and STANDARD PARTS from STOCK.

Adjt.—Capt. W. H. L. O'Neill, Ind. Inf., from a Flying Officer (Observer), June 18th.

Park Comdr.—Capt. C. E. Gardner, Glouc. R., T.F., from an Equipt. Officer, 1st Cl., and to be temp. Maj. whilst so empld., July 27th.

Equipt. Officers, 1st Cl.—From the 2nd Cl., and to be temp. Capts. whilst so empld. :—Lt. W. W. Stenning, Spec. Res., July 21st. Lt. E. S. Bramham, Spec. Res., July 27th.

Royal Regt. of Artillery.—R.G.A.—The undermentioned Maj. to be actg. Lt.-Col. :—Bt. Lt.-Col. C. C. Marindin, April 9th, 1917.

War Office, Aug. 7th.

The names of the following have been brought to the notice of the Secretary of State for War for valuable services rendered in connection with the war :—

Fletcher, Qrmr. and Hon. Lt. (temp. Lt.-Col.) A., M.C., R.F.C.
Pryce, Qrmr. and Hon. Lt. (temp. Maj.) W. J. D., R.F.C.

FROM THE COURT CIRCULAR.

The King has forwarded to Alderman Albert Ball, of Nottingham, father of the late Capt. Albert Ball, V.C., R.F.C., the following letter :—

Buckingham Palace, July 28th.

It is a matter of sincere regret to me that the death of Lieutenant (Temporary Captain) Albert Ball, D.S.O., M.C., late 7th Battalion, Notts and Derbyshire Regiment, and the Royal Flying Corps, deprived me of the pride of personally conferring upon him the Victoria Cross, the greatest of all rewards for valour and devotion to duty.

George R.I.

Alderman Ball received his son's decoration from the King at a recent investiture.

* * *

Buckingham Palace, August 3rd.

The following Officers had the honour of being received by the King, when His Majesty conferred decorations as follows :—

The Distinguished Service Cross and Bar.

Flt. Comdr. Charles Scott, R.N.A.S.

The Military Cross.

Capt. Douglas Gawler, Royal Scots and R.F.C.
Capt. Robert Holme, Somerset Light Infantry and R.F.C.
Capt. Robert Saundby, Royal Warwickshire Regt. and R.F.C.
Lt. Thomas McConkey, Canadian Infantry, attd. R.F.C.
Lt. William Meggitt, Wlesh Regt. and R.F.C.
Lt. Arnold Phillips, Royal Fusiliers and R.F.C.
Lt. Lionel Beevor-Potts, South Wales Borderers and R.F.C.

NAVAL.

The following appointments have been made ni the Royal Naval Air Service :—

July 31st.—Eng. Lt.-Comdr.—A. Leamon-Berry, graded as Proby. Sqdn. Comdr., seny. July 21st.

Lts. (R.N.V.R., tempy.).—B. T. Hamilton, W. F. Vernon, S. T. Baker, W. E. Plaister, J. R. Erskine-Murray, all promoted to Lt.-Comdr. (temp.), seny. April 1st. W. H. Yeatman-Biggs, promoted to Lt.-Comdr. (temp.), seny. July 28th.

Sub-Lt. R.N.V.R. (temp.).—W. H. Bedford, promoted to Lt. (temp.), seny. July 28th.

The following temp. commns., R.N.V.R. have been granted, seny. as stated :—Lts.—D. R. Lyson, July 15th. F. H. Burgess (A.C. II), July 26th. W. A. Herbert, J. C. Ainsworth, and L. E. West, July 28th. H. Spink, G. Haslam, J. H. Ball (temp. W.O. II), and E. Stroud, all July 30th.

Lt. (temp., R.N.V.R.).—W. C. A. Meade, graded a temp. commn. as Observer Lt., seny. Oct. 26th, 1916.

A.C. II F. H. Burgess granted a temp. commission as Lt., R.N.V.R., to date July 26th.

Temp. W.O. II J. H. Ball granted a temp. commission as Lt., R.N.V.R., with seny. June 30th.

August 1st.—Sub-Lt., R.N.V.R. (temp.).—W. Venables, promoted to Lt., R.N.V.R. (temp.), seny. June 23rd.

Messrs. J. W. Moore and L. Murphy have been entered as Lts, R.N.V.R. (temp.), seny. respectively July 24th and 29th.

Temp. commissions (R.N.V.R.) have been granted to the following, seny. as stated :—Lts.—A. L. Edwards and J. M. Auger, July 29th; J. L. Parsons, A. E. Hartley, and A. D. Wigram, July 31st.

August 6th.—Mr. R. Forbes-Bentley, D.S.C., granted temp. commission as Observer Lieutenant, seny. April 1st.

(*Continued on page* 397.)

THE NEW STEEL

COBALTCROM PATENT AIR HARDENING HIGH SPEED STEEL

(TUNGSTENLESS HIGH SPEED STEEL).

BRITISH PATENT No. 106187. **Patents applied for in all Foreign Countries.**

THIS Steel is specially suitable for Milling Cutters, Twist Drills, Reamers, Taps, Automatic Forming Tools, Screw-cutting and Finishing Tools in general, and for these purposes is **fully guaranteed** to give equal endurance to Best Tungsten High-speed Steel, producing, however, a better finish and tougher tools.

For rough Turning Tools, on mild and medium hard materials at continuous extreme speeds, the Patent Cobaltcrom Steel can only be applied as a Substitute for Tungsten High-speed Steel when run under less forced conditions.

FOR machining Gun Metal and Yellow Metals in general, for High-endurance Drawing and Blanking Dies, Lathe Centres, Shear Blades, Press Tools, Valves for Aeroplane and Automobile Combustion Motors, and all kinds of Gauges and Instruments in general which have to resist abrasion, the Patent Cobaltcrom Steel is clearly superior to Best Tungsten High-speed Steel.

For turning Chilled Rolls and Skidded Railway and Tram Tyres at customary speeds, it equals in efficiency Best Tungsten High-speed Steel.

ALSO recommended for Machine File Cutters' Chisels, Engravers' Chisels, Pneumatic Tools, Trimming Dies, Drop Hammer Dies, Needle Swaging Dies, Coin Dies, Cutters and Dies for Nails, Tack and Tingle Manufacturing, Cold Heading Dies, Hot Bolt Forging Dies, Rivet Dies, Snaps, Pipe Cutters, Mandrels, as well as for inserted teeth for Saws and Milling Cutters.

Tool Makers who have thoroughly tested Cobaltcrom Steel for **press tools**, declare it a **wonder of simplicity, utility and economy,** and predict its universal adoption in preference to any other known brand of press tool steel, as its use assures complete absence of cracking risks in the hardening of the most intricate shaped tools. Shrinkage and deformation of Cobaltcrom steel tools during hardening being practically nil, the saving in rectification costs alone, when compared with carbon tool steel, compensates for any difference in the price of material. In addition to this, at least 6 to 8 times greater cutting duration is obtained with Cobaltcrom Steel, the tools producing glassy, non-burring cuts.

Cobaltcrom Patent Air-Hardening Tungstenless High Speed Steel is supplied in bars of all commercial sections and sizes, in sheets from 1/32 in. and thicker, and in round bright drawn polished lengths.

Annealed Castings for Cutters, Gauges, etc., to customers' approved patterns are also supplied.

The cutting efficiency of tools made from castings annealed and hardened is quite equal to that of similar tools made from forged or rolled bars.

Hurry orders for blanks for Milling Cutters, rough machined to within 1/16 in., can be executed within 48 hours after receipt of telegraphic or telephonic instructions.

Finished articles supplied from Cobaltcrom Steel:—Power Hacksaw Blades, Milling Cutters, Shear Blades, and Twist Drills.

Air Hardening is effected at 1000° Centigrade, a considerably lower and less risky heat than required for Tungsten High Speed Steel.

As the specific gravity of Cobaltcrom Patent Air-Hardening Tungstenless High Speed Steel is 10 per cent. below that of Tungsten High Speed Steel it means that, taking weight for weight, a greater bulk of material is obtained, resulting in an appreciable gain to the user.

GENERAL TREATMENT INSTRUCTIONS.

This steel should ALWAYS be hardened from the Normalised state.

TO NORMALISE:—Heat the tools 800° Centigrade and allow to cool slowly in still air.

TO HARDEN:—Heat the tools slowly and thoroughly to 1000° Centigrade (except pneumatic tools and those subject to extreme shocks, which only heat to 900° Centigrade) and allow to cool naturally suspended in still air. Blast or air currents must not be used. As an alternative, quench in oily boiling water.

Salt or lead baths pyrometrically controlled are advantageous where large quantities of tools have to be hardened.

If this steel is shaped by forging it must be annealed before normalising.

FORGING TEMPERATURE:—1000° Centigrade.

Thorough annealing is effected by heating to 850 to 870° Centigrade in closed muffle and allowing to cool very slowly.

Rapid annealing on hurry jobs is effected by slowly heating to 650° Centigrade in muffle, or in blacksmiths' fire and allowing to fall there to a black heat, afterwards cooling naturally in still air or quenching in oily boiling water.

To users who have not the necessary heat controlled furnaces Pyrometer sentinels which melt at the required heat can be supplied.

Concerns who are interested in Cobaltcrom Air-Hardening Tungstenless High Speed Steel are invited to send members of their Staff dealing with the hardening of tools to the Sheffield works where modern hardening shops are equipped with specimens of the principal types of hardening furnaces.

Expert hardening instructors are daily at disposal of visitors.

Where desired, expert tool hardeners will be sent out to initiate users in heat treatment of Cobaltcrom Steel.

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The Production of Aeroplanes and their Components

(Eighth Instalment.)

BY STEPNEY BLAKENEY.

Making the Ailerons.

The spar can now be sent to the works Inspection Department, and, if passed, sent to the A.I.D. Inspector for final inspection, and then sent to the finished parts stores, ready for issue to the erectors.

The ribs for the aileron will be constructed in jigs similar to the rear portions of the ordinary long wing rib jigs, previously described and illustrated, as the aileron forms a part of the outer end of the wing, and is of the same contour and streamline section. About six ribs will be required, including the outer tip rib, which will be of slightly different constructon from the rest, being made with ¼-in. three-ply web.

The Trailing Edge.

The trailing edge consists of an ash bend terminating in a long straight portion which forms the whole of the trailing edge of the aileron, the width being about 1 in., of tapering cross section, which is about ⅜ in. thick at the leading edge side, and tapering to the trailing edge to ¼ in. thick, this being rounded on the edge, these being the finished dimensions.

Unless the firm carrying out contracts involving steam-bending are used to doing this sort of work it is best to obtain the bends from firms who specialise in this class of work.

In ordering up the required ash bends, we should have to specify that the ash bends be made out of 1¼ in. by ⅝ in. ash. This size would allow of all imperfections being machined out, when being machined up on the spindle.

A surplus of about 15 per cent. should be allowed for breakages, bad wood, bad bends, etc.

Machining Bends.

Having received the ash bends from the steam-benders, they can be taken from stores and passed into the wood machining department. The next thing to do will be to get the cutters for the vertical spindle made, together with the metal gauge of the section; these having been passed by the Inspectors, the work can be proceeded with.

This will be done by passing the bends past the cutter, in a manner similar to that used when spindling the leading edge of the wing.

The trailing edges of the ailerons when finished will then be examined by the Inspectors, and stamped by the A.I.D., if passed.

Assembling the Aileron.

The first thing to do now will be to assemble the aileron. To do this it will be best, if many are to be made, to make a couple of jig tables, left and right-hand, similar to those used for the fuselage erection. This table will be made, and cramped together, out of 6 in. by 1 in. flooring, covered with about ½ in. three-ply sheets.

The spar can be laid on this jig table, and the necessary stops glued and screwed around it to keep it in position, taking care to miss the position of the ribs. The ribs can now be put on to the spar and squared up carefully, this being of considerable importance, after which they can be glued and screwed into their final position.

The ribs are held in their place square to the spar, and prevented from moving, by additional stops at the trailing end of the ribs, and also at their end next to the spar, thus ensuring their being square with the spar.

The trailing edge can now be threaded through the ends of the ribs, and the curved end of the ash bend attached and jointed to the spar. This should be done first, in case the jointing affects the radius of the curve. This procedure allows of any adjustment being made.

The next thing to do now is to complete the fixing of the ribs, this being done by the usual method of glueing and screwing. After this, the flanges can have their surplus ends cut off and rounded. The last part to be fixed is the spruce stay from the spar to the end rib, at the opposite end to the ash bend. (See Fig. 15.)

The aileron can now be inspected, and if passed by the Works Inspector, can be inspected by the A.I.D. and passed—with luck.

Finishing.

The skeleton aileron is now ready for varnishing, after which the hinge fittings can be attached, when the varnish is dry. It can then be inspected, and is ready for going to the covering shop to have the fabric put on and stitched up, exactly as in the wings.

The doping and varnishing only remains to be done.

The next thing to be constructed will be the tail-plane, elevators, the fin, and rudder; as they are constructed principally of metal, they will be constructed in the metal department, and to this department we shall now have to turn our attention.

PLAN OF AN AILERON.

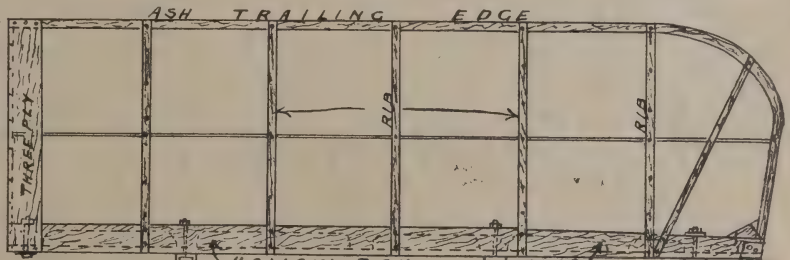

FIG. 15.

A Retrospect.

We will, however, for a few minutes, retrace our work back to the fuselage, with which we commenced. The wood work is all completed, and the process of assembling with fittings which we had not made, has all been dealt with, and it is now necessary for us to consider the various methods of making a few of the required fittings.

On referring to Fig. 8, we see from the drawing that 12 strut fittings are required. In the fuselage, these consist of wiring plates, with a square steel shoe welded on, which takes the strut end. These fittings are simple, but require considerable care in making, as aeroplane parts consist usually of light designs with small factors of safety. Which means that what is made must without doubt be made from material strictly in accordance with the specification, and absolutely not under the sizes and dimensions shown on the drawings.

The slightest disregard of this will render all parts scrap; scrap means waste of labour and money, so don't forget this, it may save time. It is useless to try substitutes; go for absolutely the right thing first time, and have it.

Metal Fittings.

As we have only a small order with which to deal, it will be useless to consider, at this stage, the production and use of punches and dies for the production of these parts, as the quantity is insufficient.

The die and punch would cost almost more than the fittings, and probably take longer to make than making all the fittings more or less by hand. When I say by hand, I mean by sawing out on the metal jig saw and filing up to a scriber line or a template, whichever method is adopted. The template, which is case-hardened, is no doubt safer, but it involves time in making templates, which could be more usefully employed in this case on actual production, namely, all hands being employed on filing up wiring plates to a scriber line, and finishing off with a fine smooth file, preferably by the most skilled hands.

Wiring Plates.

Having considered the three methods of production, namely, stampings; rough cutting-out, and filing up to a case-hardened template; or filing up a rough cutting to an accurate scriber line, I propose, in this case, to use the last, as speed is everything in our days. Therefore, I propose to detail the organisation and operations of producing the wiring plates and similar parts by this method.

We should now refer to the general arrangement drawing of the fuselage, and from the particulars given thereon ascertain the drawing and part number of each fitting, and obtain the necessary drawings. They will be sent to the planning department, who will examine the drawing, and ascertain its particulars, such as the material required.

In this case it will be mild sheet steel, the specification mentioned in the schedule, and passed by the A.I.D.

They will also detail out the operations on the instruction card to be sent into the works, the best way of producing the fittings and the sequence of operations, and full particulars of the gauge, etc., to be used. They should also, before issuing the instruction card to the works, ascertain if the material is available in the stores.

If it is, then they will fill in and issue to the stores a material requisition for the amount of the metal required to complete the fittings and the parts, as ordered for the first batch.

Having done this, the order goes to the foreman of the metal shop, and the metal is also sent from the stores to the metal shop.

(To be continued.)

RESULTANT FORCES.

The following question has been received:—

On page 13 of "Mechanics of the Aeroplane" (Duchene) will be found:—"If during horizontal flight, the engine is stopped (without interfering with the elevator), the aeroplane glides—but its velocity of flight remains *practically* the same as before."

Further down:—Engine started whilst gliding. "But if the elevator remained untouched, that is, if the angle of incidence were not varied, the speed of the aeroplane would *always remain the same.*"

Firstly, the two conditions of flight (horizontal) mentioned in the above paragraphs are more or less identical, therefore, to what extent do "practically" and "always remain the same" hold good?

Now when the machine is in horizontal flight due to the thrust and through the angle of incidence of CD, an upward force is exerted on CD at P = PQ, and also a backward force, PS at P. PQ must be equal and opposite to PO (gravity).

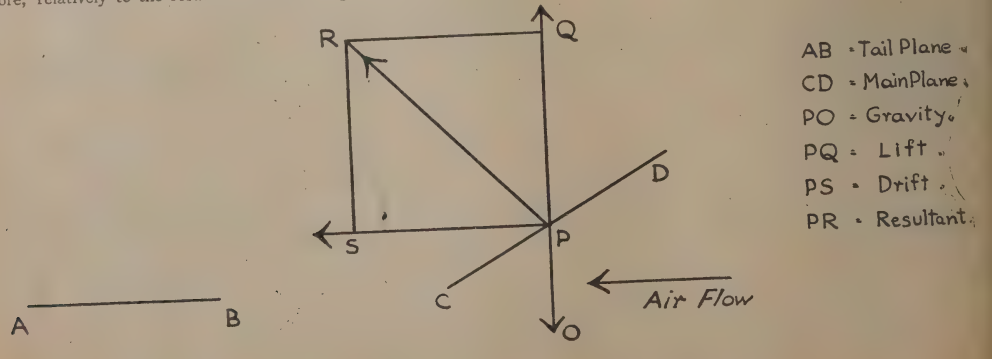
These two forces can be transformed into the parallelogram of forces PQRS, giving the resultant PR. PR is therefore greater than PQ. But PQ equals PO.

Therefore, obviously, PR is greater than PO, which is O.K.

But when the engine is off and the machine glides:—It can be seen that PR will assume (if not directly opposed to PO) certainly a more vertical position than PQ.

Now if it be true that the speed remains constant, then all the forces will remain constant. Therefore, PR will be opposed to PO. But (as per above) PR is greater than PO (gravity). Therefore, why does the machine come down at all?

The following reply is given by our side-rule specialist:—



If the speed and angle of incidence remain unaltered—then, whether gliding or flying, the resultant forces on the aeroplane remain unaltered relatively to the machine.

Since the altitude of the machine, relative to the earth, will alter according to the flight path of the machine—the direction of the gravity force will alter relatively to the machine, and, therefore, relatively to the resultant forces acting on the wings.

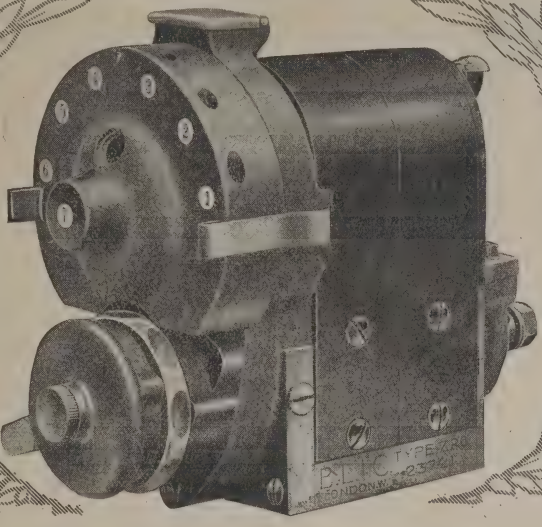
If, therefore, the machine is in equilibrium when flying horizontally—it will be so no longer if gliding downwards at exactly the same speed.

But the change in the value of the strictly vertical component of the total reaction on the wings changes by a relatively small amount with the change of altitude of the machine, and the variation in speed required to bring the vertical component back to equality with the weight is smaller still— hence, for practical purposes, it may be said that the speed remains constant.

From the strictly mathematical point of view the statement is not correct however.

THE BRITISH PETROLEUM CO., LTD.

The Directors of the British Petroleum Company, Ltd., and the Homelight Oil Co., Ltd., announce to their clients that the whole of the issued share capital of these Companies has been purchased by the Anglo-Persian Oil Company, Ltd., and that no other Company or persons have now any interest direct or indirect in the management or control.



In the Anglo-Persian Oil Co., Ltd., His Majesty's Government holds a controlling interest, the balance of the capital being entirely in British hands, consequently the British Petroleum Company and the Homelight Oil Company will be absolutely free from all foreign influences.

There will be no alteration in the conduct or management which will be carried on under the control of the new Board with the present officials and staffs of the Companies, all of whom are British.

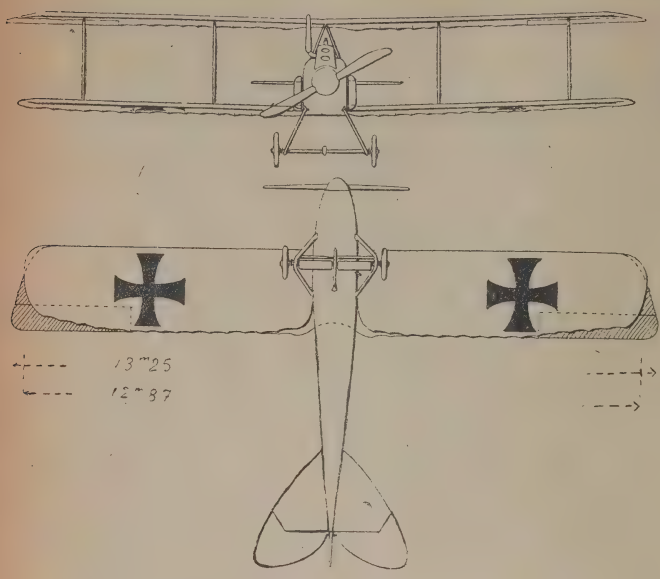
National interests have made it necessary for these Companies to curtail their business for the time being, but it is intended to resume with increased activity the full business of the Companies as soon as normal conditions prevail.

A QUESTION OF BUYING.

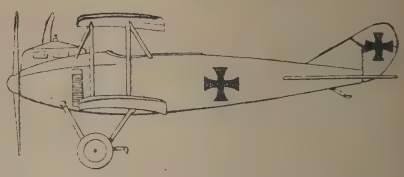
An aircraft firm of the first class requires an experienced buyer of aeronautical stores. If there happens to be such a person at liberty, he would do well to communicate with the Editor of this paper.

The High-grade British-built Magneto!

B·L·I·C



THE BRITISH LIGHTING & IGNITION Co LTD



The "B.L.I.C." Magneto is produced by an organisation with many years of practical experience in the manufacture of magnetos of the finest type.

The most careful scientific research into every detail, and the absolutely accurate standards of construction employed, have placed it in an unassailable position as the most perfect magneto yet produced.

THE BRITISH LIGHTING & IGNITION CO., LTD.
Proprietors: VICKERS, LIMITED)
204, TOTTENHAM COURT ROAD, LONDON, W.1.

GERMANY'S MODERN AEROPLANES.

THE D.F.W AVIATIK, TYPE C.V.

Span.—Upper, 13.25 metres (43 ft. 8 in.).
Span.—Lower, 12.85 metres (42 ft. 5 in.).
Chord.—1.75 metres (5 ft. 9 in.).
Surface.—42.5 sq. metres (421 sq. ft.).
Gap.—1.7 metres (5 ft. 7 in.).
Engine.—228-h.p. Benz.

POINTS TO NOTE.

Wings of almost equal span. Two pairs of struts per side. Rounded lower plane. Fin to end of fuselage, with rudder-balance above it. Heart-shaped tail, with elevator balance on each side. Round-backed fuselage with pot on propeller.

THE D.F.W. AVIATIK, TYPE CV.

The Deutsche Flegzeug Werke Gesellschaft was well known in peace-time for its somewhat ungraceful aeroplanes, some of them with crescent-shaped wings, and others with arrow-shaped wings similar to those of the Austrian Lohner biplanes.

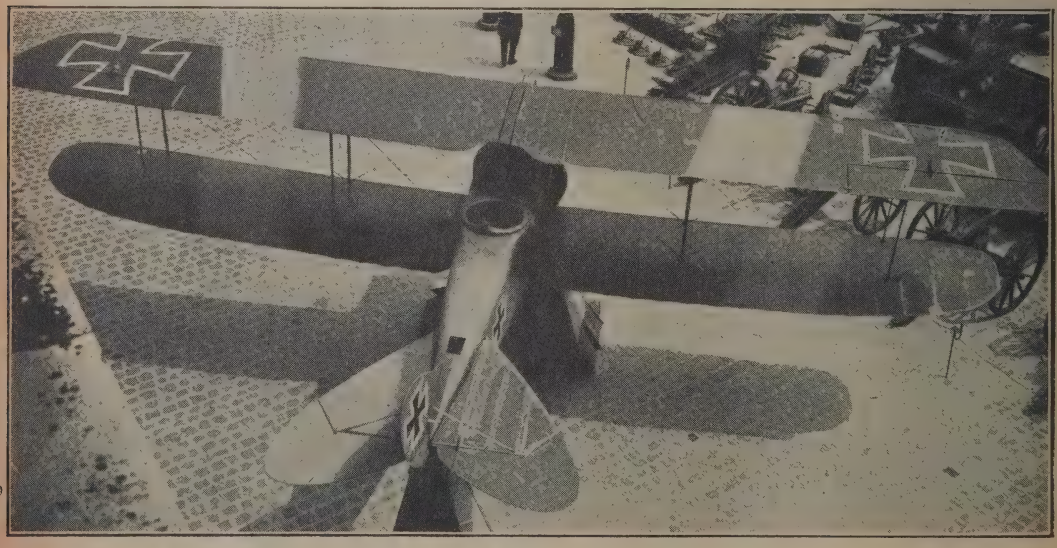
This firm has since produced a somewhat different machine, which, according to M. Lagorgette of "L'Aérophile," is in favour in Germany, and is not only constructed in the firm's own works, but also in those of the Aviatik und Automobil Aktien Gesellschaft, at Leipzig-Heiterblick.

The wings have a dihedral, but are not swept back. The span of the lower wings (12.85 m. or 42 ft. 5 in.) is nearly equal to that of the upper wings (13.25 m. or 43 ft. 8 in.).

The ends of the upper planes are oblique, those of the lower planes retreating and rounded.

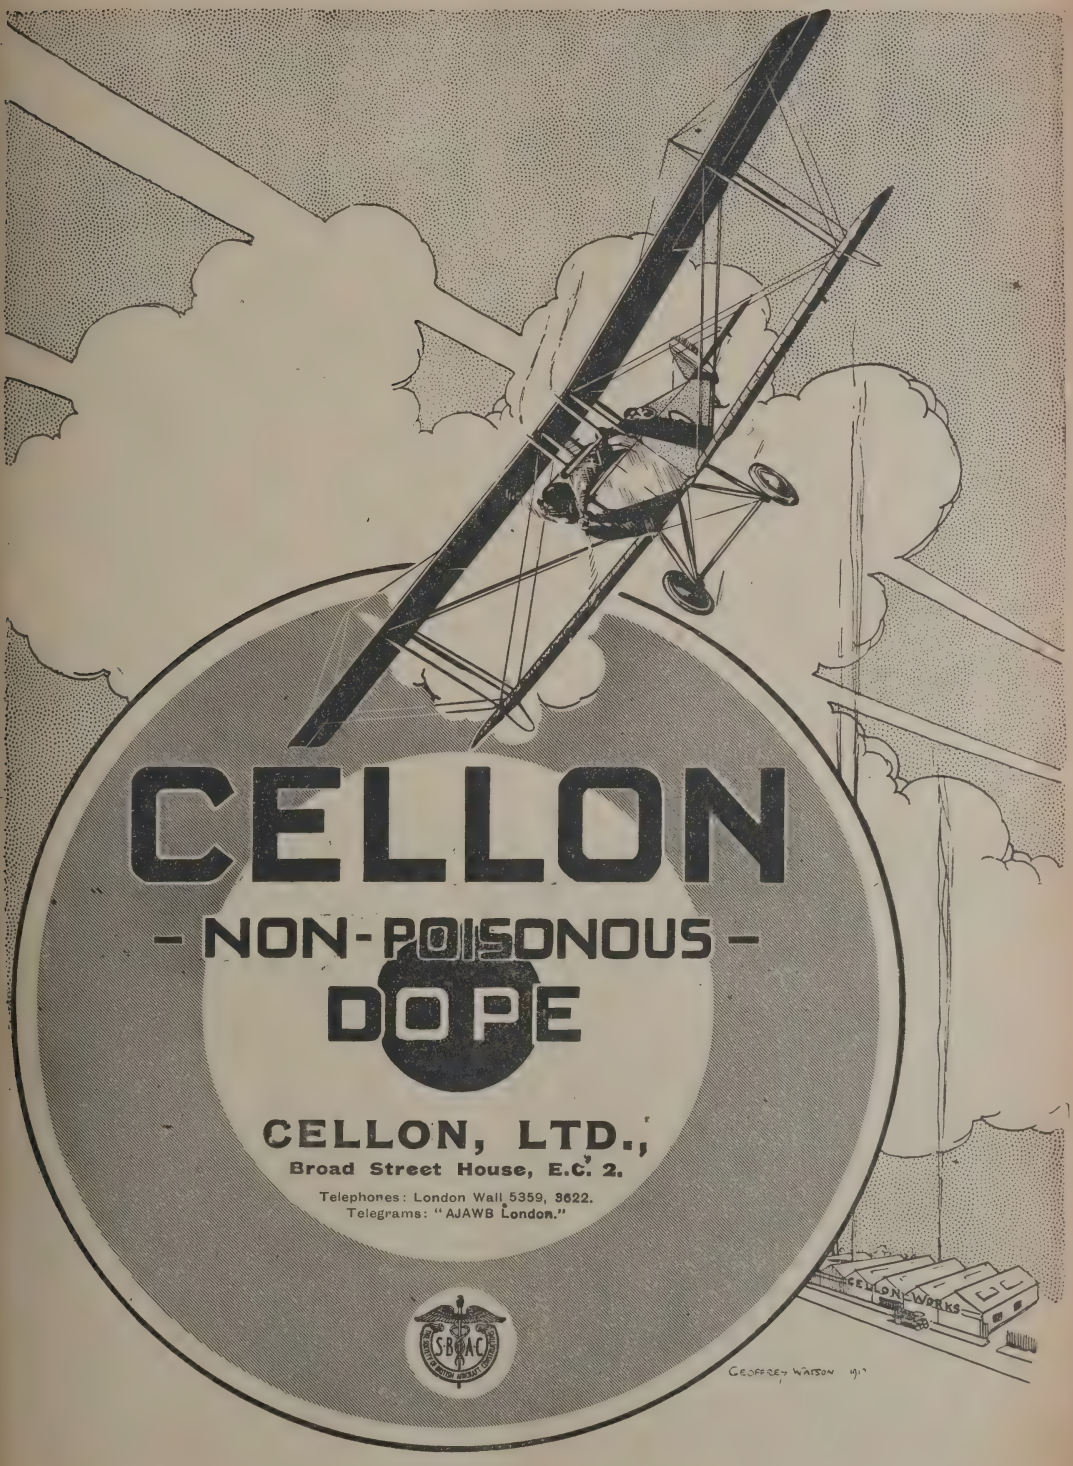
Their maximum chord is 1.75 m. (5 ft. 9 in.). The total lifting surface is about 42.5 sq. m. (421 sq. ft.). The gap is considerable, namely, 1.7 m. (5 ft. 7 in.), which gives the machine a tall appearance.

The wings progressively wash out from root to tip. The lower wings have an incidence of 6 deg. near the fuselage as far as the third rib. This decreases to 4.3 deg. at the 13th rib, which is placed 0.4 m. beyond the external struts.



The incidence of the upper plane is 5 deg. from the cabane to the sixth rib, and 3.3 deg. at the 13th rib, where the aileron commences. The incidence on the right and left wings is uniform.

The cabane is of traditional D.F.W. type, trestled-shaped, and constructed of four struts 1.25 m. long.



Above the cabane is a central wing section, 13 centimetres wide, to which the upper main planes are attached, and which contains a small reservoir holding about 3 litres.

There are two pairs of struts on each side of the fuselage.

The distance between the front and rear spars, and consequently between front and rear interplane struts, is 0.76 m.,

GEOFFREY WATSON 1917

considerably less than half the chord of the wing. The spars taper considerably towards the ends, and are lapped with fabric.

In addition to the four cables which connect the wing attachments on the cabane and the fuselage to the summits and bases of the inner struts, there is a cable which runs between the top of the front chassis strut and the top of the rear inner interplane strut.

The rectangular ailerons are 2.45 m. by 0.5 m., with rounded ends. Their frame is metallic, as are the frames of the fixed tail planes.

The control planes preserve the appearance of the early models. The fixed stabilising plane is 1.72 m. long and is supported by two tubes, and together with the elevator flaps has a heart-shaped appearance, with a span of 3 m. The rudder, fixed vertical fin, and the end of the fuselage together present the contour of a spatula, a trifle elevated.

The controls differ, however, from earlier models, in that the elevator flaps and the rudder are balanced by triangular extensions which conform to segments cut from the fixed planes.

The fuselage terminates in a vertical knife-edge, rather shallow in depth. The section is rectangular with rounded edges.

As in earlier models, it is entirely covered with three-ply, which is painted with green and brown camouflage streaks. The underneath of the wings is a bright yellow. The rest of the machine is green and brown.

The nose of the machine, and its propeller pot, are somewhat pointed, thus avoiding blanketing the centre part of the propeller.

The landing-carriage is standard, the wheelbase being 2 metres wide. The suspension is rubber cord. The cross-axle is streamlined. There is cable cross-bracing between the front chassis struts. There is a claw brake.

The motor is a fixed Benz, giving 228 h.p. at 1,410 r.p.m. The cylinders are almost entirely enclosed in a special cowl.

The propeller, a 3-metre "Wotan," is made of ash and walnut in alternate layers.

The radiators are placed on the sides of the fuselage, where they form rather deep projections (14 cm.), and are 75 cm. high and 21 cm. from front to back. Their base is found between the front chassis strut and the leading edge of the lower wing. They are made by Hans Windhoff.

The water reservoir on top of the engine is triangular like that in the Albatros D.I.

The pilot sits upon the petrol tank, which also forms a back and arm-rest. He has a machine-gun placed to the right of the motor.

The passenger sits behind, surrounded by a gun-ring.

There is only one bomb-release for six bombs, placed one above another.

The full load is 950 kgs. (2,100 lbs.), of which, 300 kgs. (660 lbs.) is useful load.

THE REX FIGHTING BIPLANE.

The chaser-biplane, constructed by the Rex Company of Cologne, is not definitely known to have been used on active service on the Western Front.

The information available shows it to be a single-seater fighter of the D.II type.

The machine offers a striking resemblance to the Nieuport, the more especially because the lower wings have a span slightly less than that of the upper wings (about 9 metres), and a much smaller chord. In fact, the lower plane is smaller and lighter in all its aspects.

Contrary to Nieuport practice, the lower wings have no dihedral, and it is almost certain that they are not swept back. The upper wings are trapezoidal in plan view.

There is only one pair of interplane struts on either side of the fuselage, which are arranged "V" fashion as in the Albatros D.III.

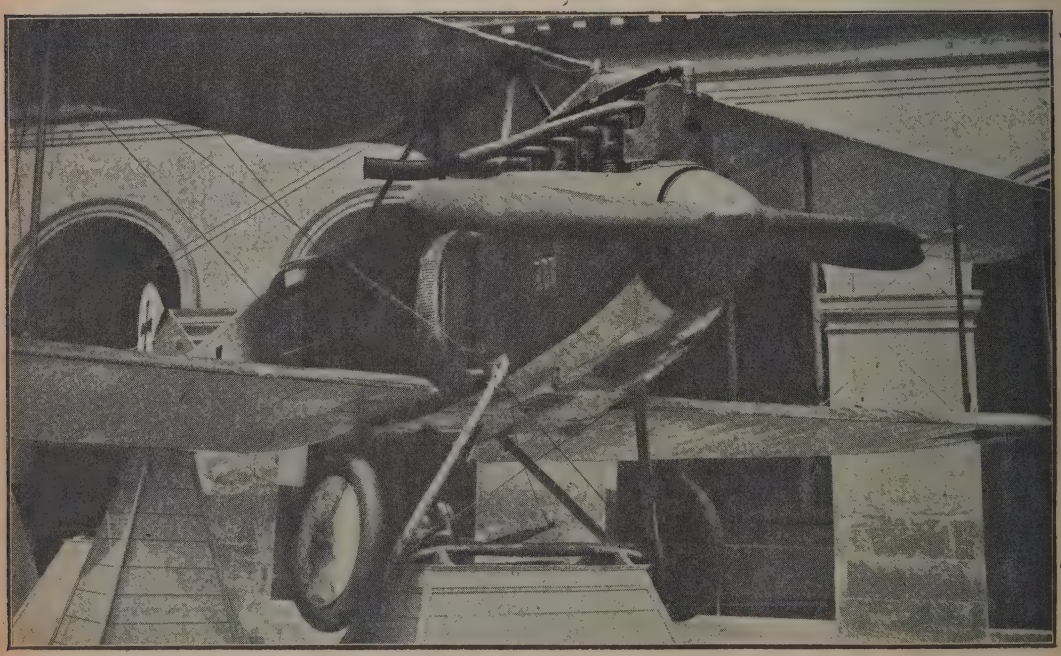
The upper wings are placed very close to the fuselage, and are attached to a central section, which is supported by short splayed-out struts reinforced with wire bracing.

The elevating planes are placed in line with the axis of the motor, and have no incidence.

The rudder is very tall, and is believed to be placed entirely above the fuselage, as in the Albatros fighter.

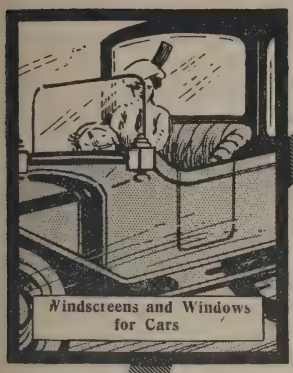
The fuselage is a three-ply monocoque, with projecting flats for the attachment of the lower wings.

The landing-carriage is ordinary "V" type, with cable cross bracing.



The Rex is apparently always fitted with a rotating monosoupape Rex engine (Gnôme type), and carries a machine-gun placed to the right and synchronised with the motor.

This machine may be distinguished from the Albatros D.III by the absence of a dihedral to the lower plane.

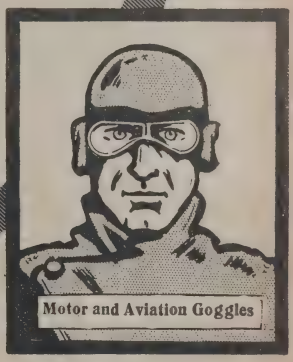


THE AGO FIGHTING BIPLANE.

Aeroplanes built by the Aktien Gesellschaft Otto are not seen at the front in large numbers. In addition to the large twin fuselage machine, which has not been very successful, the firm constructs general purpose two-seater machines of medium size, with two pairs of interplane struts on either side of the fuselage, and small single-seat biplanes, with one pair of struts on either side.

These last machines differ from the Nieuport in that they

FRONT VIEW OF THE CAPTURED D.F.W. AVIATIK IN PARIS.—The shape of the nose shows clearly how the Germans obtain better propeller efficiency than we do, and also how, by fitting their radiators directly in the slip-stream, they manage to run big engines with small radiators. These points contrast favourably with our own methods.



The Wonderful Properties

of Triplex Safety Glass have made it a commercial necessity in every branch of automobile and aeronautical engineering. Absolutely unsplinterable; cannot "fly" if broken, and yet is as clear as plate glass.

TRIPLEX
SAFETY GLASS

THE FOKKER FIGHTING BIPLANE.

Span.—30 ft.
Length.—24 ft.
Chord.—5 ft.
Motor.—100-h.p. Oberursel.

POINTS TO NOTE.

Raised centre section of top plane.
Equal span of top and bottom planes.
Hexagonal sectioned fuselage.
Morane type elevator.
"Comma"-shaped rudder.

have a dihedral to the upper plane, but the wings are not swept back. The chord of the lower wings is small, and, therefore, they appear to be narrow. The struts are parallel and not V-shaped as in the Nieuport.

THE FOKKER BIPLANE.

M. Jean Lagorgette, writing in "L'Aérophile" of June 15th, points out that the Fokker monoplane is no more used except on the Eastern fronts, and that this make is now represented on the Franco-British front by a single-seater biplane, which differs from the 1915 biplane with small lower wings.

The newer biplane with lower wings equal to upper wings was illustrated by Mr. Geoffrey Watson many months ago in THE AEROPLANE, but a detailed description of the machine is not without interest.

Various models have been built, some with the 100-h.p Oberursel rotary engine, and others with the 175-h.p. stationary six-cylinder Mercédès. No specimen is available in sufficiently good condition for exact dimensions to be procured.

The span of the machine is about 9 metres; length, 7 metres; height, 2.5 metres; chord of wings, 1.5 metres.

The lower wings are exactly similar to the upper wings, neither have a dihedral nor an "arrow." The tips are slightly oblique, the gap is very small (1.3 metres).

The upper wings are attached to a low cabane of Nieuport type, and almost touch the top of the fuselage, to such an extent, in fact, that they have to be raised in front, and very much cut away at the rear to permit the use of the machine-gun.

There is a marked stagger. The two pairs of struts on either side are made of steel tube with streamline fairings, as is the landing carriage.

The lateral control is not obtained by ailerons, as in other biplanes, but by warping of the upper and lower wings by means of two cables which connect the control lever with the tops of the four rear interplane struts, and two others which attach to their base, and pass over the top of the cabane. The struts are not braced fore and aft.

Between each pair of ribs, the fabric is kept in place from the leading edge to the front main spar by three intermediate beadings.

The rudder is in the form of a comma, but a trifle like the Nieuport, and projects farther back towards the rear than in the Fokker monoplane.

The elevators are similar to those of the Morane.

The big Morane type fuselage, hexagonal in section, flattens off towards the rear, but the whole thing has the form of a monocoque, and the general appearance of a whale.

The landing carriage is of simple form, no longer an "M" seen from the front, as in the Morane, and with complicated tubes behind, but two simple "Ys" pointing towards the front as in certain later Moranes.

The motor is a monosoupape type Oberursel—practically a Gnome—with a cowl identical with that on the monoplane, but with its cheeks cut away at the bottom.

The propeller is usually a Garuda.

A fixed machine-gun, in the case of the stationary type motor, is placed to the right of the motor. In the case of the type with rotary engine, the gun is mounted above the cowl, slightly to the right. In some cases there are two machine-guns.

The wings, fuselage and tail are painted green and brown, and the underpart of the wings a clear sky-blue, which, one gathers, is quite effective at high altitudes.

This machine is likely to be confused with the Nieuport, though it is a mixed copy of Nieuport, Spad, and of British machines, and of the single-engined Morane biplane, a machine which is not used on service by the French Army, nor is it much more in fashion in the British Army.

The Fokker differs from the Morane biplane in that its wings have two pairs of struts on each side of the fuselage, instead of a single pair, and in that it is slightly staggered (less so than certain similar British biplanes), and it is less trapezoidal in plan view. Contrary to previous practice, in these cases the French machine possesses a vertical tail fin as well as a rudder, and the German machine has no fin, but only a comma-shaped (balanced) rudder.

If its control members resemble those of a Nieuport—(which they do not.—Ed. THE AEROPLANE)—the machine differs in the absence of an overhang on the top plane of the dihedral, and of the small appearance of the lower wings, also because of the two rows of struts, which are not "V" shaped, and, again, because of the narrowing of the fuselage towards the tail, when viewed in side elevation.

THE L.T.G. "TORPEDO BIPLANE," TYPE D.

The Luft Torpedo-Gesellschaft of Johannisthal, a company which has recently been established, manufactures a fighting aeroplane, nearly similar in appearance to the Albatros fighter.

The wings have no dihedral nor are they swept back, and the chord of the lower planes is slightly less than that of the upper.

The upper wings meet the top of the fuselage.

On either side there is one pair of interplane struts; placed closely one behind the other (the rear spar has behind it more than half of the wing), and the struts approach one another slightly towards their bases.

The ailerons do not project, and are compensated by a forward projection, as in other new German machines.

The tail planes are like those of the Albatros fighter. The rudder and fixed fin are similarly placed above the fuselage, but are slightly more oval.

The landing-carriage, especially its rear members, is placed somewhat farther forward than usual. The propeller has a revolving pot. The motor is of the fixed variety and gives 175-h.p.

AERO-MOTORS
IN KIND AND CONSTRUCTION

By Geoffrey de Holden-Stone

Suggestions and Queries.

What every woman—and an occasional author—knows, is that sustain anything like protracted interest, you must keep ople guessing. Only do that, and all will be forgiven. So the ement of surprise—even to the ultimately handed lemon—be- mes essential. And to none more, I imagine, than myself in spect of these discourses on the diversities and perversities of ro-motors, kind or unkind.

Here it is then. So far it may have been noticed, that I have erely described how the Chadderton mechanical scheme re- mbles that other. And how it differs. Also, wherein its ysical cycle is different from any other two-stroker. And like- ise, how the Chadderton motor is intended to work, as compared ith that other; which I have beheld at work by the hour; not leating its full," indeed, but to the extent of skewing the eaviest of official wind-sticks hopelessly out of truth, such was power output. I have also suggested that the Chadderton stem might work as a V-type; of which, and also the working its special pressure controlled dual-purpose valve, I am confi- nt enough.

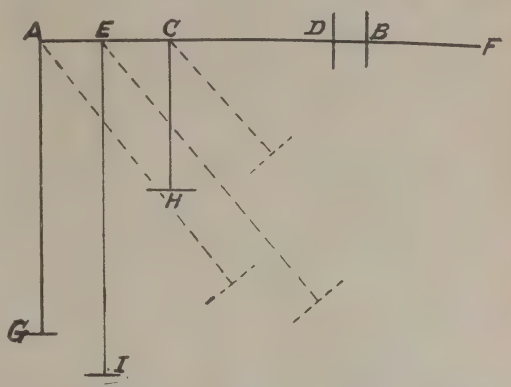
But if you will notice carefully, I have never actually said that e Chadderton motor, *as a rotary*, did or would work. Or as *air-cooled* proposition in any shape or form. Both questions re arguable, it seems. And of the latter, I am frankly doubt- l. As to the former, let us see.

The Rotary Position: Mechanically.

Regard now that crank-shaft, with its opposed throws, as a xed affair in the rotary manner. Either throw is eccentric to e common axis of the shaft and crank-chamber—of which the linder length is the radius, of course—and doubly so to each ther. But both pistons are tied to these throws rigidly, and ave only freedom of side-wise motion: so the outer one becomes s it were the cylinder, and the inner, the ordinary piston of, t us say, a Gnôme.

So imagining the firing to have taken place, it is evident at so far from the double-ended explosion shock having any floating" effect on the crank-shaft—which is the supreme merit of at other design, as a V or a vertical—or being balanced itself— merely stresses it none too evenly, on all three cranks, half pon the middle one and a quarter to each side one.

Actually, the respective proportions of the shock dispersion are to half on the crank-shaft and half on the piston heads: at is, a quarter to the middle crank, an eighth to each side ne, and a quarter each to the two piston heads.



The Proof of Adequate Motion.

But what about the motion part of it? To prove this, it is nly necessary to draw a line A B representing the distance etween the lower crank-axis and the outer piston head. Then ithin these points, and on the same line, to mark off a distance orresponding to the length between the upper crank-axis and e inner piston head: as C D. And then likewise on the same ne, from a point E—midway between A and C to correspond ith the shaft and crank-chamber axis, to continue the line as ar as a point F for the cylinder length or radius from E.

Now the particular point to notice is that points D and B— he piston heads—will be comparatively close, as at the instroke f full compression before firing: while B and F, outer piston ead and cylinder top, are remote.

Assume then firing to have occurred: and on that assumption rm the basic points A, C, and E, and at *right-angles* to the ine, draw lines of *equivalent lengths*, A G, C H, and E I.

Now it will be seen that the distance between G and H— epresenting the piston heads at full outstroke, the distance is now great as the original distance A C between their respective rank-axes, *plus* their original slight distance D B. Thus roving that motion must have occurred relatively between the iston heads B G, D H. Notice also that the outer piston head G, is now quite near to the cylinder top I, proving the occur- nce of an outstroke to the beginning of the exhaust. So the ylinder must have moved relatively to the outer piston accord- ng to schedule, if merely as a container. Drawing still other ines from A, C, and E, at an angle of 45 deg. to the original ine, would only show the relative distances between the other nds of those lines to be half of what they were at a rectangle: hus proving the progression of the stroke: and, finally, that here can be no question of the Chadderton motor's mechanical vorking as a rotary.

A B—Diagrammatic length from crank-pin to piston-head of outer piston at end of instroke.
C D—Diagrammatic length from crank-pin to piston-head of inner piston at end of instroke.
E F—Diagrammatic length from crank-shaft axis to cylinder-head.
A G—Same as A B on outstroke.
C H—Same as C D on outstroke; both showing the new relative distance between the piston-heads G and H (formerly B and D respectively), and both from
E I, towards which G has now approached, and H received from.

The Physical Aspect.

On the other hand, I am inclined to doubt its successful physical working as an air-cooled motor—and, therefore, as a rotary at all—for this reason. It is true that the outer piston head G and the inner one H, during the entire exhaust-stroke, are coming to their original positions B and D: and hence are scavenging the exhaust between them through the valve, effectively enough.

But they are not scavenging it direct into the open—as when the exhaust valve of a Gnome opens—but only into the pot B F. That is to say, into the entire cylinder area, through which the working stroke of the outer piston travels. The surface of this space must therefore be lubricated, yet will be perpetually burnt dry. For note that, whereas in a four-stroke motor during the exhaust stroke, not only the rush of the exhaust gases helps them out into the open air, but the piston is actively pumping them out. Whereas nothing is expelling them from the pot in this case. Therefore, it seems to me that the pot must soon overheat, besides having every vestige of the oil burnt off its walls. Hence I fear, no rotary.

The Preferable Alternatives.

As a water-cooled V-type, or a radial—merely a multiplication of V's—the Chadderton design looks better, since any initial extra heat, due to any lingering of the exhaust in the pot, would be absorbed by the water, and any residual gases would be immediately scavenged from the pot by the next outstroke of the outer piston. And well water-jacketed it would indeed need to be. For notice that the outer piston-head is subjected to exhaust heat during the entire instroke, and to the far greater combustion heat during the whole of the working outstroke. And that only for a fraction of a moment—during the charge injection—does it get a chance to cool. That is to say—taking the speed at 1,200 r.p.m.—during 1/40 of a second or less. instead of the 1/20 or more in the conventional cycles, two or four stroke. I should say that in these circumstances, it is just possible to escape pre-ignition, even during that instantaneous charge-injection. No air can enter the "pot" against the exhaust-flow, so the piston-head cannot suck in air during the instroke; and there is no perpetual flow of cool mixture over its head—as in the other motor already referred to—during the primary induction; because that part of the Chadderton cycle is effected internally, centrally of the motor.

The Conditions: and the Prospect.

One sees, then, how hopeless it is to consider the Chadderton as a rotary proposition, whatever the merits of its design—if modified—in any stationary shape, adequately water-cooled.

Nothing short of that will suffice; for even air-blast cooling through air-jackets would hardly suffice. So one sees, in any case, of what a special metal, with what a low coefficient of expansion must the piston, and particularly that channel valve, need to be made. Also how essential it would be to adhere to the valve-less ideal in all other respects.

Still, all this is merely a statement of the conditions and difficulties of the proposition as they appear to me; not at all saying in the approved official way "the thing cannot be done." Victories that count are won, after all, by forcing an ideal through in spite of difficulties that seem insurmountable. But you must have obtained the most photographic survey of your battle-ground to know precisely what it contains, before you begin fighting. Theoretically, the Chadderton cycle appears to me to possess singular merits, and to have been conceived with exceptional perception of the basic requirements. As a two-stroke proposition, its wagon is hitched to a star. Practically, too, the design displays the greatest promise of achievement, provided that every obscure mechanical obstacle or defect be foreseen and overcome. And, in fine, one may say this, that, given this success, the physical efficiency, heat-engine result, the fuel-economy and the power output should be extraordinary.

The Purpose of the Cycle.

Coming, then, to the actual inspiration and purpose of the Chadderton cycle, as expressed in its charge-injection under pressure, one finds that it is a three-fold one: apart, of course, from its minor aims of cold-gas delivery, shock balance—very questionable, as already explained—a less noisy exhaust, greater flexibility, and less weight. In the first instance, the intention is to provide constant and certain self-starting; a convenience, but not an essential.

The second part of it is to keep the carburation so remote and locked up until the absolute instant of use, that the motor shall not be able to catch fire in any circumstances; for it is to be noted that it does not involve pressure in the petrol-tank in the least. To support this, one does not remember any case of the Antoinette motor—embodying much the same principle—ever taking fire in any of the accidents that befell its death-trap mo plane

But the third part of the idea is by far the most import from a military standpoint, for it aims at nothing short of abolition of the roof. Which is the motor's limitation, ra than the plane's. One need not quote any inside facts—incid ally well known to the Huns and to everybody but ourselves- support of the statement that the high-speed geared down a mobile type of motor is no use at high altitudes, because chokes to death like a fish out of water, so that you cannot another 100 revs. out of it, let alone on the propeller; wher the Huns use a direct-coupled motor with a 1,000 to 2,000 r.p normal and an acceleration—with a consequently direct effe to 1,600 r.p.m. or better in the thin air.

And its Partial Success. Why?

The Chadderton cycle obviously aims to eliminate this ind tion choking, with its five-atmosphere-pressure charge injecti and obviously, that principle must succeed to a great extent. wholly, as I shall show. But sufficiently to have at once arou official interest, and immediately active support, instead of ev ing nothing more than the official promise "to inspect" when the outbreak of war, the whole scheme was laid before both W and Admiralty, and—turned down; although public money thousands was forthcoming to foster "official" designs.

Yet, why not wholly? For the simple reason of the nature the air at high altitudes. You cannot work with other t your surrounding element, deficiencies and all, unless you pose to remedy those deficiencies. What those chemical d ciencies are, is no business of mine to discuss. We hear a gr deal of the wonderful aeromotor developments that were inspi at Brooklands. So it is a curious coincidence that a little de which was once practised at Brooklands—and forever barred, so forgotten—should supply the answer and key to the full h dred per cent. of the roof problem so far as the motor is concern Which the clever Huns do not yet seem to know, judging fr what has not been found on any captured machine. You can it at most chemists.

(To be continued.)

MARKET REPORTS.

Prices given are for quantities on usual terms.

August 2nd, 1917.

COPPER.—The position in America is still most difficult, and it is hoped that the authorities there will realise that maximum production should now be the goal, prices taking a second place.

If the labour situation does not soon improve it is quite probable that it will have an effect upon prices, as the output has suffered a very serious check. The position here is unaltered, and prices of Ingot Copper remain the same. It will be observed that in consequence of the reduction in the prices of Ingot Copper the prices for Sheets and Tubes have now been adjusted.

Copper Ingot (Standard)	£125 per ton Cash.
Copper Sheets	£160 per ton Cash.
Copper Tubes, S.D.	19½d. per lb.
Brass Sheets, 24 Gauge	15½d. per lb.
Brass Tubes, S.D.	16½d. per lb.

TIN.—The market is a little brighter although prices are again on the upgrade. America is now buying, and the business is likely to increase. There is every indication that the demand for English Tin will continue to improve.

Comparative Prices.

To-day	£246 0 0
July 26th	241 10 0
Last Week	238 15 0
Last Month	245 10 0
Highest Last Year	205 0 0

LEAD.—Prices are still unaltered, and the chief interest centres round supplies. It is gratifying to note that there is sufficient to meet national requirements.

Comparative Prices.

To-day (Official Average)	£30 0 0
Last Year (Official Average)	27 7 6
1915 (Official Average)	23 17 6
Highest Price, 1916	36 10 0

STEEL.—The Steel situation remains the same. Supplies are certainly improving, but there is still an enormous accumulation of orders for Aircraft Steels; furthermore, there will be a colossal increase in the demand, and it will be an impossi task anything like to fulfil the orders unless the authori quickly arrange for a great increase in the output of Spe Aircraft Steels. There are ample supplies of Sheet Steel, H.S. Steels and Cast Steels are most difficult to procure.

Current Average Prices.

R.A.F. 3B	Steel, 36s. to 40s. per cwt., Basis. (Black or Blue Reeled).
R.A.F. 1E	Steel, 78s. to 80s. per cwt., Basis. (Black or Blue Reeled).
R.A.F. 9A	Sheet Steel, 30s. to 32s. per cwt.

ALUMINIUM.—The position remains unaltered.

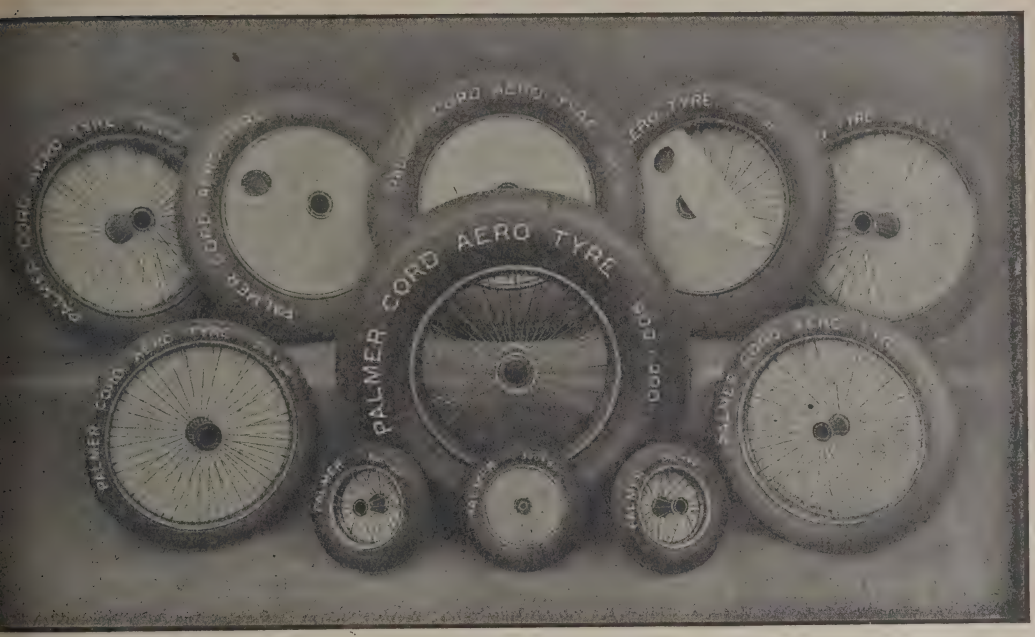
Official Prices.

Ingot	£225 per ton.
Remelted	£210 per ton.

TIMBER.—The question of supplies is now being taken in earnest, but chiefly in unofficial circles. If the production aeroplanes has to be very considerably increased, then the Ti ber problem will be the most difficult to solve. The Uni States have already tackled the situation, and are now carryi out systematic experiments with obtainable woods. Apparen the only way to solve the whole difficulty is to find substitut We learn that the Silver Spruce which the Government supplying to contractors is very unsatisfactory, and if Mahogany and Walnut is no better, it is more than likely t the whole of the wood will be left on their hands. Pri naturally continue very firm.

Current Average Prices.

Silver Spruce,	17s. 6d., c.f.
English Ash,	13s. 6d. to 15s., c.f.
Walnut,	2s. 3d. to 2s. 6d., s.f.
Mahogany,	2s. 2d. to 2s. 4d., s.f.



Prices are for selection and delivery.

FABRIC.—Supplies are fairly good, but there is still so doubt surrounding the official prices for the 17C Linen Fabr The price of 2s. 8d., 36 in. wide, is certainly out of all reas and we are strongly of the opinion that some official has made serious error.

SUCCESSFUL FLIGHT can only be attained by ensuring maximum efficiency in all departments. **FOSTER PYROMETERS** place maximum efficiency in Heat Treatment within the reach of relatively unskilled operators. **CATALOGUES & QUOTATIONS ON REQUEST.**

FOSTER INSTRUMENT COMPANY, Letchworth, Herts. CHARLES EDWIN FOSTER, Sole Proprietor. British.

THE CASE OF AUTOGENOUS WELDING.

By Artifex.

Some months before the war, in the course of a visit to a large firm of motor-carriers, I was shown a large heap of fragments—motorous fragments—in one corner of their garage. "That," said the manager, "is the most expensive exhibit in our show. Guess how much it represents? Just a little over £10,000." Now only a motor-trader or a Bucklersbury financier can talk about such large sums unmoved; to say nothing of their apparent loss. I at least could not, so forthwith examined this Golgotha of uncoined capital in curious detail; only to find, after a mere five minutes' raking, how fully justified is the present phrase "apparent loss." For there was nothing, no two matching bits, that a good autogenous welding plant, handled by a man of experience, could not have converted into a profit: if we may agree to call "profit" that which is represented by the normal working of the efficient machine, or one thus restored to efficiency.

So the newer, truer commercial economics—though one does not remember seeing the matter so sensibly put before—really amount to this, that there is no actual wealth in raw material *per se*, not even in all the idle gold in any bank: but only in the judicious employment thereof. Which is just another way of saying, in the experience that belongs: the super-efficiency which spells success being merely experience sublimated into a fine art.

Here, for instance, are the tubes of paint. There—no doubt they might have been better used—is this year's Academy: or better still—any motor-trader could say—a fine carriage panel. Here are the steel blooms, the ingots of bronze; there the £1,000 motor-car. What is the magic that has translated the one into the other? Nothing but experience.

Somewhere then, in the dim offing of comprehension, arrives the case of the autogenous welding-plant.

Surveying that scrap-heap and all its forsaken possibilities, between whiffs, I proceeded to set forth the foregoing facts; not so ornately, but in those plain, Saxon pavement-phrases most suited to the managerial hide. His reply, as to the employment of such a repair-plant, was likewise "Not——likely!"

"Here," one thought, "is the rare wise man who knows not, and knows that he knows not"; but far from embracing him as the proverb recommends, I assailed him in still more vigorous language for his reasons, since it is only in the seat of the foolish that one can gain true instruction on any matter. They came—sorted and washed of their colour—to the effect that "surely nobody thought it would pay him to keep an incarnadined blow-pipe fakir loafing about the place at three quid a week waiting for accidents that weren't supposed to happen. Or did anyone imagine that any of the fitters, or the yard man, could handle the plant in his spare time? For if so, he knew better than to ask for more trouble in that way. No, that was what the scrap-heap was used for, in his business as a crimson common carrier. He believed in getting new parts right away, to save time and give the insurance company a chance to make good. But wasn't that scrap-heap enough to drive any man to drink?" It was; or did.

Such is the wisdom of the practical man, whose practice is the eternal compromise of the imperfect, for he is the beaver who just *has* to climb the tree of commercial solvency. There, at least, however, was the appreciation of the wage-worth of experience, and the utter fatuity of employing anything else. Yet coupled, as usual, with the inability to see round his immediate troubles. But, from the detached onlooker's standpoint, there was the fact of the scrap-heap, as proof that accidents do happen; and will, whether "supposed to" or not. Also, its merciless reduction of ten thousand good sovereigns to a fiver's worth of scrap metal. There surely must be some alternative. There is, actually. What man, who, after great adventure, has ever lain face downwards for urgent hindward patchings, will deny the greater economy—to say nothing of quicker freedom for new excursions—of sound repairs executed by a specialist. Given these, no insurance for his penny. It is only in after life that such delusions crowd upon us to cloud the sane judgment of seven years. And losing our imagination of the Ought-to-Be, we no longer strive to make it come true.

That is why, in the case of autogenous welding, while we rightly decline to trust its results in casual hands, we do not see that the more we believe in its possibilities, the more we shall encourage specialism to make a business of the work, because of the livelihood offered by the amount of the work thus made available. There is assuredly no branch of constructive craftsmanship less overcrowded at present; equally none, of which the products are more in demand—almost essential demand—in motor-car and aeroplane engineering, quite apart from actual repair work. That is to say, IF they are reliable.

Yet to assure reliability—which is only to ensure an extraordinary margin of safety—there must be a long apprenticeship to the work even when allied to the keenest intelligence and natural aptitude on the part of the practitioner. Not only must theory be studied assiduously—any amount of it, as anyone with the slightest knowledge of metallurgy or chemistry will readily understand—but all the theory on the subject in existence is utterly useless if not simultaneously accompanied by actual hand-practice. Consequently, it is not only from the workshops of a firm that specialises in autogenous welding that we can expect to see reliable work turned out, but it is only there that learners, by seeing examples of such work and the craft-practice of the oldest hands, can form their own standards, and expect to become equally proficient. There are, it is said, tricks in all trades. In autogenous welding, however, there are none in the ordinary sense of trickwork—which, in this case, only means slumming a job—but there are numberless "turns" of practice, apparent mysteries, to be personally solved under the guidance of older hands; judgments and appreciations to be formed as to the nature of any one of a hundred given jobs; in all of which precision and certainty—which are essential to turning out reliable work—can only be acquired by personal experience. Obviously it is only such firms that can constitute anything like a nucleus of craftmanship and of reliable hands. Just as obviously, it is vain to look for them elsewhere. Occasionally, the self-taught genius may occur: but in ninety-nine cases out of a hundred the self-taught man will have to unlearn most of his practice.

(To be continued.)

DESIGN AND PRODUCTION OF AIRCRAFT IN WARTIME.

By Wing Commander J. W. Seddon, R.N.

Reproduced from "Automobile Topics," New York, June 30th.

One of the proved facts of aerial warfare is that the command of the air rests very largely, indeed, with the side producing the best single-seated fighter, provided it is produced and used in sufficient quantity, and the Allies are devoting particular attention to the improvement of this type. Hitherto popular designs have survived on the Western front from three months to a year; those lasting for a year have always overstayed their welcome, and it is probable that the period of the single-seater fighting plane in the future will be not more than six months because this is sufficient time to permit the enemy to obtain all information about a given model and copy or improve it. The same line of progress applies to other types, but to a much less extent.

It is clear that the designer, particularly of the small fighting aeroplane, whether in France, Great Britain, or America, is always confronted with the problem of designing a type that is an advance on any contemporary machine of a similar type. A machine can be an advance on a similar type in one of two main respects: (a) Because it possesses a better performance. (b) Because its fighting facilities are better. Each of these main headings includes a number of subdivisions; thus better performance may mean better climbing only or better speed only or greater endurance or any combination of these, while better fighting facilities may mean better manœuvring capacity or better view or better positions for guns or improved weapons or any combination of these.

The design of a new type involves procedure along one of the following general lines: (1) Increase the horse-power weight ratio; (2) decrease the wing or structure resistance; (3) devise a new arrangement of the supporting planes with regard to the position of pilot or crew. After enlarging somewhat upon the methods to be followed, the author returns to the subject of wing resistance, and points out that wing resistance has been notably reduced by the employment of low resistance aerofoils and by the proper shaping of wing tips. Wind-tunnel research has given a good range of aerofoils varying from the low resistance type carrying about 5 lbs. per square foot at 45 miles per hour at its maximum lift angle to the high-lift aerofoil which carries 7 lbs. per square foot under the same conditions. When the minimum speed is specified if the aerofoil carrying 7½ lbs. is utilised in place of that carrying only 5 lbs., both at the usually specified speed of 45 miles per hour, there will be a large saving in area and consequently in weight by using the high-lift variety. The weight-saving extends to the whole plane, and is roughly approximated at 1½ lbs. per square foot of area saved, which materially increase the horse-power weight ratio in favour of the high lift machine. Improvement is also obtained in ease of handling and in view. The author then points out the limitations that restrict high-lift design, and states that it is quite possible that the super-scout of the near future with a low resistance type aerofoil will have a speed range of 50 to 150 miles an hour, while the same machine with a medium lift type curve would probably achieve 50 to 125 miles an hour, and with the highest lift aerofoil 50 to 100 miles per hour only. The point is brought out that while excess horse-power is of value in the low resistance aerofoil it becomes increasingly wasteful as the lift is increased.

It is most desirable that designers in this country (U.S.A.) be encouraged to compete in the race of producing the best fighting scout. Ultimate judgment is in the hands of the pilots who demand the best and the best only.

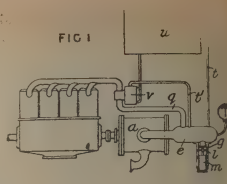
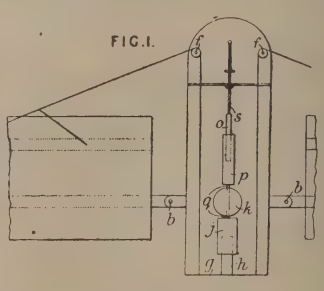
Abridgments of recently published Specifications.

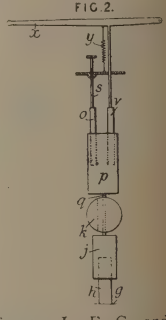


106,612. Aeronautics. Mary A. C., 27, Cours Lieutand, Marseilles, France. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act.

Propelling; Steering.—Relates to aerial screw propellers for a dirigible balloon, the shafts of which are adapted to be turned through 180 degrees in a vertical or horizontal plane. Fig. 1 shows two propellers mounted on rotary caps *f* carried by a transverse girder *a*, the flanges *g* of the caps being toothed to engage pinions *h* on a transverse shaft having a worm-wheel *i* engaged by a worm on a shaft provided with a hand-wheel *j*. The propellers are driven through gears *e* from horizontal shafts *d*, which are geared, as shown, to engines *c* on the car. A propeller-shaft adapted to be turned through an angle in an horizontal plane is used at the front and rear of the dirigible, the rotary caps corresponding to the caps *f* being turned by tubular members concentric with vertical driving-shafts.

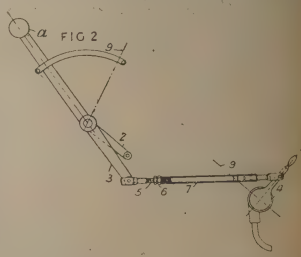


106,635. Internal-combustion engines. Watson, H., 38, Marlborough Road, Wimbledon Park, Hay, J., 159, Castellain Mansions, Maida Vale, and Jonques, L. A., Hythe Road, Willesden Junction, all in London.



Reservoir Pressure, Regulating; Driving-gear; Pumps; Carburetting.—Engines are supplied with air at sea-level pressure independently of the altitude at which they work, by means of apparatus comprising a pump *a* which will deliver sufficient air at the highest altitude and a reservoir *e* with a safety-valve *g* which is loaded and balanced by a cylinder *m* and piston of the same area as the valve and containing air at sea-level density and apparatus *l* to compensate for variation in the length of the valve spindle under varying temperatures. Expansible chambers filled with air and springs may take the place of the cylinder and piston; or the valve may be loaded by a spring which is adjustable by hand to a pressure gauge. The petrol tank *u* and float chamber *v* are connected to the air reservoir by pipes *t*, *t*¹, and the induction pipe *q* may be fitted with a sliding valve which will allow the engine to draw air directly from the atmosphere, in case of a breakdown of the pump. The Provisional Specification also states that the air may enter the chamber through a funnel facing in the direction of movement, that the pump may be driven by variable-speed gear controlled by an aneroid, and that the air chamber may be heated by the exhaust.

106,639. Aeronautics. McGregor, G. S., Fort Grange, Gosport, Hampshire.



Steering and Balancing.—For steering and balancing an aeroplane in a vertical plane, the wings are adapted to be swung longitudinally against the elastic pressure of pneumatic cushions. Fig. 1 shows an aeroplane in plan having its rear spars pivoted at *b* to the frame. The front edges of the wings are connected by cords led over pulleys *f* to a cross-piece *g* carried by the plunger *h* of a cylinder *j* containing oil or glycerine, etc. The cylinder *j* communicates through a pipe *q* with a chamber *k* having an air space which constitutes the elastic cushion resisting backward movement of the wings under wind pressure. The pipe *q* is continued to a second chamber *p*, in which two plungers *o*, *v*, Fig. 2, are provided. The plunger *o* is moved by a screwed spindle *s* to effect adjustment of the system, and for setting the machine in a desired altitude, and the plunger *v* is moved by a hand-lever *x* for ordinary control. A spring *y* normally balances the pressure of the plunger *v* on the hand-lever. A modification is described in which the front spars of the wings are pivoted, the rear spars being connected to plungers working in a single transverse cylinder. The control may act upon the cables instead of on an auxiliary plunger.

106,744. Internal-combustion engines. Butler, L. F G. and Brazil, Straker, & Co., Motor Works, Fishponds, Bristol.

Regulating.—Control mechanism, particularly adapted for the engines of aircraft, comprises means by which the throttle valve and the fuel-supply valve or the supplementary-air valve are opened independently, the backward movement of the throttle-valve lever returning the air-valve or the fuel valve to a closed or predetermined position. In the arrangement shown in Fig. 2, a lever *a* has an arm 2 connected to the throttle-valve, and an arm 3 carrying a rod 5 which slides freely in a tube 7 connected to the supplementary-air valve or fuel-valve lever 4, which may be moved into its fully open position 9 after the throttle-valve lever *a* has been moved into its corresponding fully

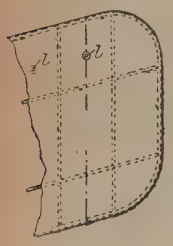
BEARDMORE
AERO ENGINES

"BEARDMORE"—a name famous throughout the world of engineering.



This historic name on AERO ENGINES is a guarantee of general excellence and highest possible efficiency.

THE BEARDMORE AERO ENGINE LTD.
London Showrooms and Depots:
112, GREAT PORTLAND STREET, LONDON, W. 1.
Telephone: Gerrard 238.

C.D.C.

open position. The closing movement of the lever *a* brings a nut 6 into contact with the tube 7 and returns the lever 4, thus shutting off the supplementary air or fuel supplies. A modification is described in which the control levers are adjacent; in returning, a projection on the throttle-valve lever engages the other lever and moves it into its closed position.

FIG 2

106,645. Aeronautics. Quick, W. B., "Belmont," Station Road, Wootton, Isle of Wight.

Planes, Construction of; Aerostats.—The whole extent of the planes of aeroplanes and seaplanes is divided into a number of spaces containing air-tight containers adapted to be inflated with air, hydrogen, or other gas to render the planes more buoyant. The containers have each a nozzle *l* and a valve by means of which they are inflated separately or by a common supply pipe.

WORKMEN'S UNEMPLOYMENT INSURANCE.

HOW TO OBTAIN A REFUND OF A PORTION OF THE EMPLOYER'S CONTRIBUTIONS.

By T. Kemp Walton, A.C.I.S.

Section 94 of the National Insurance Act, 1911, as amended by Section 5 of the National Insurance (Part II Amendment) Act, provides for certain refunds to the employer of a portion of the amount he contributes to the National Insurance Fund by the affixing weekly of Unemployment stamps to his employees' Unemployment Books, and as there are now in the Aircraft Industry many employers whose workers were not prior to the outbreak of war in an insured trade, but who now, owing to being engaged on a different class of work, have to contribute to the Unemployment Fund, it is hoped that the following notes will be of assistance by explaining how such refunds may be obtained.

The Act stipulates that the Board of Trade shall, on the application of any employer made in the prescribed manner within two months after the termination of an Insurance Year, refund to such employer as soon as practicable out of the Unemployment Fund the sum of three shillings in respect of each workman in respect of whom he has paid not less than forty-five contributions.

The Insurance Year is the period of not more than fifty-three weeks, which ends on the Saturday nearest the 14th July in any year. As this year the 14th July falls on a Saturday, it is upon this date that the 1916-1917 Insurance Year ends, and claims must, therefore, be submitted before 14th September next, otherwise they will not be considered.

Claims can be only in respect of the period since 16th July, 1916, as applications for refunds for the year preceding this date had to be sent in before 15th September, 1916.

A "Contribution" is considered as 2½d., and it, therefore, follows that to the Unemployment Book of each worker included in the claim not less than forty-five fivepenny stamps must have been affixed during the Insurance Year, or the equivalent of that number may be made up by stamps of other denominations, a fourpenny stamp being four-fifths and a twopenny stamp two-fifths of a contribution.

The application for refund must be worded in the manner set out in the first schedule of the Unemployment Insurance (Refunds to Employers) Regulations, 1915—Statutory Rules and Orders, 1915, No. 514, and which is as follows:—

NATIONAL INSURANCE ACTS, 1911 TO 1915, UNEMPLOYMENT INSURANCE.

Application by Employer for Refund under Section 94 as amended.

I (We), the undersigned, hereby apply to the Board of Trade for a refund as set out below in respect of the workmen whose names are set out in the Schedule(s) annexed hereto; and I (we) hereby certify:—

(1) That not less than forty-five contributions (otherwise than by virtue of the last sub-section of Section 5 of the National Insurance (Part II Amendment) Act, 1914, have been paid by me (us) during the insurance year ending on in respect of each of the workmen whose names are set out in the First Schedule annexed to this application, and

(2) That not less than forty-five contributions by virtue of the last sub-section of Section 5 of the National Insurance (Part II Amendment) Act, 1914, have been paid by me (us) during the insurance year ending in respect of each of the workmen whose names are set out in the Second Schedule annexed to this application; and

(3) That the particulars set out below and in the Schedules annexed to this application are to the best of my (our) knowledge true and accurate, and are in accordance with the records contained in my (our) books of account.

Date ..... Signature of Applicant .....

Particulars.

Full name and address of employer. .....

Business of employer. .....

Day of week:—
(a) on which wages are paid .....
(b) up to which wages are paid. .....

Has the employer had an arrangement with the Board of Trade during the insurance year for stamping at extended intervals, or for stamping in the week after payment of wages? If so, give particulars. .....

Number of workmen in respect of whom application is made. First Schedule. Second Schedule.

Amount of refund claimed. First Schedule. Second Schedule.

Total amount of refund claimed. £ : :

This must be accompanied with a statement (in duplicate), giving the number of each worker's Unemployment Book and the letters appearing thereon indicating the Division to which the Book belongs, and the surnames and initials of the workers.

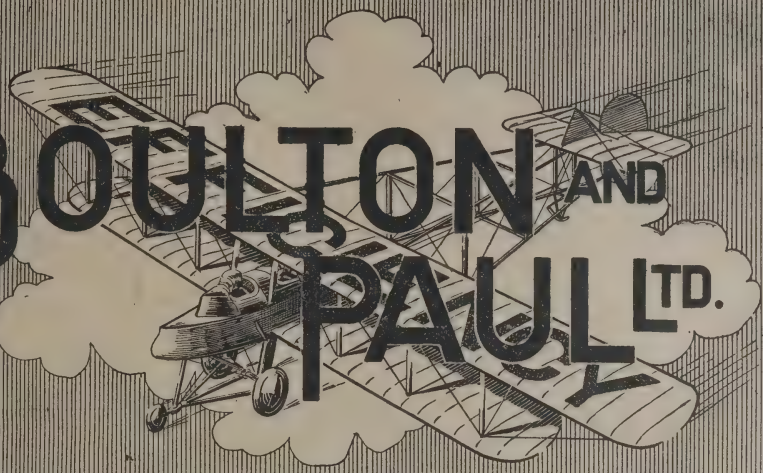
These particulars are usually given in the following form:—

Name of employer .....

First Schedule—Particulars of Claim.

Employer's Distinguishing No. of Worker.	Name of Worker.		Unemployment Book.	
	Initials.	Surname.	No. of Book.	Division.

It is not necessary to show the number or value of stamps affixed to each book, as only men in respect of whom not less than forty-five contributions each have been paid should be included, and the amount of refund is fixed, viz.:—three shilling each person.



It will be noted that the prescribed form of application set out above refers to amount of refund claimed under First Schedule and Second Schedule.

The First Schedule is that illustrated, while the Second Schedule is for particulars of men in respect of whom refund is claimed at a reduced rate. As the reduced rate is allowed only in exceptional circumstances, i.e., where employers and employed have been exempted during the insurance year from paying full contributions owing to working systematically short time; and where men have been absent while training with the Territorial Force or Naval, or Army Reserve, neither of which circumstances now operate, owing to the war, the Second Schedule can be ignored except by those employers who have an arrangement under Section 99 of the Act whereby the Unemployment Books of their workers are stamped by the Labour Exchange, and not by their own Wages Department, and, even in this case, it will not be necessary to submit the Second Schedule if at least forty-five contributions of 2½d. have been paid by the employer in respect of each man.

As many employers do not enter upon their records the numbers and letters appearing on the Unemployment Books, it is essential, if the employer wishes his claim to be considered, that this information be noted before the 1916-1917 books, which expire on the 14th July, 1917, are returned to the workmen or to the Labour Exchange.

When completed, the applications must be sent to the local Labour Exchange, or to the Controller, Claims and Record Office (Minister of Labour), Unemployment Insurance, London, S.W.1. The claim will be acknowledged, and, in the ordinary course, the application being in order, the employer will receive a remittance for the refund a few months later.

Temp. Proby. Observer Officer G. H. Millar promoted to temp. Observer Lt., with seny. June 17th.

August 7th.—Flt. Comdr.—R. B. Ward, reapptd. as Act. Sqdn. Comdr., seny. July 26th.

Flt. Lts.—C. Murray and J. Forgon-Potts, reapptd. as Act. Flt. Comdrs., seny. July 26th.

Temp. commissions as Lt. (R.N.V.R.) have been granted to the undermentioned, seny. as stated:—J. Sydenham (P.O.), August 2nd; M. G. Jones, J. G. Levy (A.C., 1), and F. J. Todd, August 4th.

The Casualty List.

Reported Aug. 1st.

Accidentally Killed.—Denholm, Prob. Flt. Officer R. M., R.N.

Missing, believed Killed.—Chadwick, Actg. Flt. Comdr. A. J., R.N.
Roach, Flt. Sub-Lt. G., R.N.

Wounded.—Forman, Flt. Sub-Lt. J. H., R.N.

Accidentally Killed.—Collins, M. G., P.O. Mech., F.4670.
Lightstone, S., Aircraftsman, 2nd Gde., F.15791.

Died of Wounds.—Allen, W., Air Mech., 1st Gde., F.1053.

Drowned.—Tunnard, J. H., P.O. Mech., F.6012.

Reported August 2nd.

Missing.—Reid, Flt. Sub-Lt. E. V., R.N.
Austen, Flt. Sub-Lt. V. G., R.N.

Slightly Injured.—Luckham, Flt. Sub-Lt. P. F. T., R.N.

Reported August 3rd.

Previously reported Missing (believed Prisoner), now officially reported Prisoner in Germany.—Paine, Flt. Sub-Lt. Leo P., D.S.C., R.N.

Reported August 4th.

Missing.—Richardson, Flt. Lt. (Lt., R.N.R.) W. H., R.N.
Allaway, Flt. Sub-Lt. W., R.N.

PERSONAL NOTICES.

Death.

DENHOLM.—At an inquest on the body of Robert Miller Denholm, aged 18, a young aviator, of Greenock, who was killed while flying over Essex, it was stated that a wing of his aeroplane collapsed in mid-air, and the aviator was thrown from the machine.

Marriage.

COPE—ROBINSON.—The wedding took place at Datchet parish church on August 1st, of Flt. Lt. T. L. Cope, R.N., son of the late Mr. Thomas Cope and Mrs. Gardiner, and the Hon. Norah Robinson, eldest daughter of Lord and Lady Rosmead, of Westfields, Datchet. Flt. Lt. Cope is well known as a member of Sir Ernest Shackleton's Expedition to the South Pole. On returning from the expedition Mr. Cope at once got a commission in the R.N.A.S. The bride has only recently returned from working in a French hospital, and was back on short leave when the marriage was arranged. The wedding ceremony was performed by the Rev. Canon Edgar Sheppard, Sub-Dean of the Chapels Royal, assisted by the Rev. J. H. Davis, of St. Mary's, Datchet. The bride was attended by Miss Diana Knight (her cousin). The best man was Mr. R. Pines.

Rules have been issued by the Commissioners of the Admiralty for securing the safety of airship and kite-balloon stations under their control. These forbid smoking, except as authorised by the officer in charge; and the taking into any danger building or danger area of tobacco or any contrivance for smoking, or of any matches or lights, except as authorised. Police officers are given the right to search anyone entering or in the station, and the entry of any person in a state of intoxication is forbidden.

MILITARY.

G.H.Q. Communiqués.

August 1st, 10.10 p.m.—Yesterday, in spite of weather which made flying almost impossible, our aeroplanes kept contact with our advancing infantry throughout the day.

The enemy's aerodromes, transport, and infantry were also successfully attacked with bombs and machine-gun fire.

The few enemy machines that attempted to fly were attacked, and six of them were brought down.

Three of our machines are missing.

August 6th, 9.6 p.m.—Yesterday, after several days of inactivity due to unfavourable weather, our aeroplanes were again able to carry out successful bombing raids and other work.

In air fighting, five German aeroplanes were brought down, one of which was forced to land behind our lines, and three others were driven down out of control.

One of our machines is missing.

War Office Communiqué.

Aug. 2nd.—The G.O.C. the British Forces in Macedonia reports:—

Our aeroplanes have bombed hostile camps and dumps at various points north of Seres, between Lake Butkova and the Rupel Pass and east of Petric (all places east of Struma).

The Casualty List.

PERSONAL NOTICES.

DEATHS.

AIRTH.—Lt. Rennie Alexander Airth, Bedfordshire Regt., attached R.F.C., who was killed on active service on July 29th, was the beloved elder son of Mr. and Mrs. George Rennie Airth. He was 23 years old.

BLACKBURN.—Lt. Harry Dudley Blackburn, Royal Berkshire Regt., attached R.F.C. (previously reported missing on April 5th, now reported killed on that date), was the son of the late Henry Bingham Blackburn and Mrs. Henry Bingham Blackburn, of Danehurst, Eastbourne. He was educated at St. Augustins, and Hill Brow, Eastbourne, and at Wellington (Mr. Bevor's House). On the outbreak of war he joined the Artists Rifles, and served with them at home and in France for over 10 months, when he accepted a commission in the Royal Berkshire Regt., with whom he saw a good deal of fighting till he was invalided home. He joined the R.F.C. later, and went out again to France as an observer with his squadron on January 13th. He obtained his "wings" a few weeks before he was killed.

CONRAN.—Major Owen Mostyn Conran, R.F.C. and "King's Own" Regt., and late attached Egyptian Army, who was killed on a night bombing expedition on July 28th, was the son of the late Major Conran and of Mrs. Conran, Brondyffryn, Denbigh. He was 36 years of age.

CURPHEY.—Capt. W. G. S. Curphey, M.C., R.F.C., son of W. S. Curphey, Local Government Board, Whitehall, and 87, Canfield Gardens, Hampstead, was reported as missing on May 14th. News has subsequently been received that he died on the following day in a German field hospital at Bouchain. He was 21 years of age.

Educated at Glasgow Academy and at University College School, London, he joined the Royal Berkshire Regt. in 1914, transferring to the R.F.C. in 1916, in which year he was awarded the Military Cross.

The "London Gazette" of Nov. 19th stated: "He brought down an enemy machine, and two days later attacked and brought down another. He has frequently attacked formations of hostile aircraft and brought them down." In February he was awarded a bar to his M.C. The "London Gazette" of March 12th stated: "He, with a patrol of four machines, attacked a hostile formation of 10 machines. After a prolonged fight he drove one enemy machine down. Later, although wounded, he again led another attack on a hostile machine, and succeeded in bringing it down. He has on many previous occasions done fine work."

His Commanding Officer writes: "He is a very great loss to the squadron, in which he was absolutely adored by officers and men alike, and the R.F.C. loses one of its most capable, gallant, and valuable members."

ELLIS.—Mr. George Ronald Ellis, R.F.C., who died on July 26th as the result of a flying accident in Scotland, was the eldest son of Mr. and Mrs. George Ellis, "Easthorpe," Mirfield, Yorkshire.

FITZGERALD.—Sec. Lt. William Wilks FitzGerald, R.F.C. (killed in action on July 27th), was 22 years of age, and the only son of Mr. and Mrs. M. F. FitzGerald, of Fairholme, Kill-o'-the-Grange, County Dublin. He received his commission in Sept., 1916, and was an observer in the R.F.C.

HART-DAIVES.—Lt. Ivan Beaclerk Hart-Davies, R.F.C., whose death was recorded last week, was educated at a school at Maidenhead and at King's School, Canterbury, and began life as a schoolmaster at New Beacon, Sevenoaks. Afterwards, however, he worked up a wide life insurance and motor insurance business in the Midlands.

He held the "end-to-end" "record" for motor-cycles and light cars, and in 1913, with three other motor-cyclists, won the Mürren Cup, though none of the four had done any bobsleighing before.

A brother officer writes:—"A gallant fellow whom we all liked immensely, and are deeply grieved that he should have been fatally injured when he so much wished to go to France, where, doubtless, he would have won honours."

JAMES.—Lt. James, attached R.F.C., a Canadian officer, was killed on August 3rd owing to his aeroplane falling near Brooklands. Mr. James was born in Canada, and it is not yet known whether he had any relatives in this country.

A verdict of death by misadventure was returned at the inquest on August 6th.

Capt. Fuller, R.F.C., stated that when at a height of 150 ft. deceased seemed to get into trouble. The machine swung to the right and then nose-dived to the earth. Other evidence was given that deceased died two hours after the accident (without having recovered consciousness), from fracture of the skull. Deceased was an expert pilot and was learning artillery observation work.

LOVELL.—Sec. Lt. William Leslie Lovell, Royal West Kent Regt., attached R.F.C. (killed in action on July 27th), was 21 years of age, and the only son of Mr. and Mrs. Edgar Lovell, of The Gables, Cheyne Walk, Croydon. He had his commission in the West Kents in October, 1916, and, joining the R.F.C., was given his "wings" in April of this year.

McPHERSON.—Sec. Lt. Leonard Alfred McPherson, R.F.C., who was reported missing, and later killed, on July 28th, was 19 years of age, and was the eldest son of Mr. A. McPherson, late principal of the Printing Office, Bank of England, and Mrs. McPherson, of 203, Rosendale Road, West Dulwich. He was educated at Dulwich College, where he held the rank of Colour Sergeant in the O.T.C. He left Dulwich in July, 1915, when he was 17 years of age, and joined the Inns of Court O.T.C., being gazetted to a commission in the R.F.C. in January of this year. He obtained his wings and left England for the front early in May.

His commanding officer writes:—"I have lost a most promising and brave young pilot, who already had done much valuable work for his 'side.' He met his death with an aerial gunner on the evening of July 28th. He must have seen some enemy troops on the road, and came down low in order to fire on them with his machine-gun. In doing this brave act he was evidently fired on from the ground, and must have been killed instantly. The machine came down in No Man's Land, and the bodies were recovered with difficulty. . . He died like a gallant English gentleman in the execution of his duty."

MORGAN.—Sec. Lt. Ronald Charles Wybrow Morgan, South Wales Borderers and R.F.C. (died on July 28th in hospital from wounds received the preceding day), was the only child of A. Herbert Morgan, of Westgate-on-Sea, and Mark Lane. Born in September, 1897, he was educated at Doon House, Westgate-on-Sea, and at Uppingham School. In July, 1915, he obtained his commission in the South Wales Borderers, was attached a year later to the Royal Flying Corps, and secured his pilot's certificate early in the present year. In April last he went out to France, and remained there until his death.

MORRISON.—Sec. Lt. Lindsay Morrison, R.F.C., who died on July 28th as the result of a flying accident in England, was the son of Mr. and Mrs. J. A. Morrison, Bairnsdale, Australia.

NORRIS.—Sec. Lt. Harold Aubrey Blurton Norris, R.F.C., whose death was announced last week, was 21 years of age. He joined the London Regt. on the outbreak of war, and went to France in February, 1915, being invalided home in the following July. He received his commission in July, 1916, gained his wings in December, and proceeded to France in May last.

O'BEIRNE.—Lt. Arthur James L. O'Beirne, Yeomanry, attached R.F.C. (died on July 27th of wounds received in action the same day) was the elder and only surviving son of Major O'Beirne, late Royal Warwickshire Regt., and of Mrs. O'Beirne, of Astrop Grange, near Banbury, and Ougherea, County Longford. He was gazetted Second Lieutenant in the Yeomanry in July, 1915, and was afterwards attached to the R.F.C.

PROTHERO.—Capt. Phillip Bernard Prothero, Argyll and Sutherland Highlanders and R.F.C. (killed in action on July 26th), was second son of the late the Rev. Edward Douglas Prothero and of Mrs. Prothero. He was 23 years of age, and was Lieutenant in the Argyll and Sutherlands in May, 1916; in the following September he was given the rank of Captain whilst a Flight-Commander in the R.F.C.

RODOCANACHI.—Sec. Lt. Paul Rodocanachi, R.F.C. (killed in action on July 27th), was 19 years of age, and had a commission in February this year; he was gazetted Flying Officer in May.

ROSS AND MICHENCI.—Major Arthur Justin Ross, D.S.O., R.E., the Commander of an Air Station in the Eastern Counties, met his death on the night of August 2nd when piloting a biplane. He was accompanied by a pupil, Lt. Leo Michenci, Canadian Engineers, attached R.F.C., who was also killed. The machine appears to have got into a spinning nose-dive when about 300 ft. from the ground.

Arthur Justin Ross, D.S.O., R.E. and R.F.C., was the only surviving son of Mr. G. E. A. Ross, K.C., and of Mrs. Ross, of Warwick Road. He was born in July, 1881, and passed out of Woolwich into the Royal Engineers in May, 1900. He was promoted in May, 1903, and after being on half pay rejoined the Corps of Royal Engineers, and had his captaincy in 1910. In January, 1911, he was seconded for service with the Egyptian Army.

Major Ross, who had his majority in June, 1915, was appointed Flight Commander R.F.C., in June of last year. His award of the Companionship of the Distinguished Service Order was in the Birthday Honours List of 1916, and he also held the Egyptian Honour of the Nile (4th class).

The father of Major Ross has been well known in real tennis at Prince's and Queen's for many years, and is Chairman of Queen's Club.

SCAIFE.—Lt. Thomas Earle Gordon Scaife, M.C., Dragoon Guards, attached R.F.C., who was reported missing while flying over the enemy lines on September 26th, 1916, is now officially presumed to have died on that date. Born at Leicester in 1892, he was the only son of Mr. T. E. Scaife, M.Inst.C.E., Cape Town, and Mrs. Scaife, Earles Dyke, Camps Bay, C.P. He received his education at the South African College School, Cape Town, and was farming in South Africa when the war broke out.

He was a trooper in the Mounted Rifles of the Union Defence Force, but having received a nomination he entered Sandhurst in May, 1915, and in September of the same year he was attached to the R.F.C. In December he went to the front and was continuously flying, with the exception of a few days' leave, until he met with his death.

On the day after he was missing, his brigade commander wrote:—"Your boy had been covering himself with glory during the whole of the fighting. He was the best exponent in my brigade of some new and very important work, and the corps for whom he was observing were full of his praises."

In August, 1916, Mr. Scaife was awarded the Military Cross for skill when on contact patrol work during active operations. On one occasion, when flying at 1,000 ft., his petrol tanks were pierced by shell fire. He managed to stop the holes and enabled his pilot to bring the machine home. He had been several times mentioned in dispatches.

SMITH.—Capt. Geoffrey Cholerton Smith, M.C., A.S.C., attached R.F.C., who died of wounds on July 31st, was the younger son of Mr. and Mrs. Alfred Smith, of 11, Magdalen Road, Wandsworth Common. He was born in April, 1897, and was educated at Emmanuel School, Wandsworth Common, and Strand School, Brixton. He was a member of the school O.T.C., entered Sandhurst in April, 1915, and was gazetted to the Army Service Corps in August, 1915. He was sent to the front in September, 1915, was attached to a French mortar battery in June, 1916, and took part in the battle of the Somme. He was awarded the Military Cross for gallant conduct in an engagement. He was transferred to the R.F.C. last January, and took part in the Wytschaete and the present offensive.

TURNER.—Lt. W. G. D. Turner, R.F.C., whose death was announced last week, was educated at Heath Mount, Hampstead, St. Cuthbert's, Malvern Link, and at Malvern College, where he was a member of the college O.T.C. He went up to St. John's College, Oxford, in October, 1914, where he joined the University O.T.C., from which he obtained the next month a commission in the Middlesex Regt. After serving for about a year and a half he exchanged into the R.F.C., and gained his "wings" in July, 1916, being appointed an instructor on the day he became pilot. For many months he acted as an instructor with various squadrons, and last May he went abroad.

On May 24th he was returning from a reconnaissance over the enemy lines when he was attacked by hostile aircraft. He was then reported missing only, but is now reported killed. The C.O. of the squadron which he left when he went to the front writes:—"It was with the greatest sorrow that I heard of the death of your son. As you know, he was extraordinarily popular here, and I feel his loss very much, both as a personal friend and as an officer who had worked hard and well for this squadron. I wish that he were still here and going overseas with us, but one could not expect one of his temperament to wait so long; it was only natural of him to want to go. . . . I am more sorry than I can express." His Squadron Commander in France wrote:—"Your son had been with this squadron only a few days, but I had already come to look on him as one of my best officers, and I shall miss him very much, as will all my officers."

WALTER.—Capt. and Flt. Comdr. Stephen Reginald Parke Walter, the Queen's and R.F.C. (killed in action on August 1st), was only child of Stephen Walter, late Captain 3rd Dragoon Guards, and of Mrs. Walter, The Parsonage, East Farleigh, Kent. He was 20 years of age, and received his commission in the Queen's (Royal West Surrey Regt.) in December.

WEBB-SMITH.—Sec. Lt. Charles Webb-Smith, who died as the result of an accident while flying on July 28th, was the eldest son of Mr. and Mrs. A. L. Smith, of Tenbury, and the husband of Gwladys (née Hillsdon) Smith, of 12a, Latham Terrace, Bedford Park. He was 25 years of age.

D'ERF WHEELER.—Capt. Percival Francis Crommelin d'Erf Wheeler, Dorset Regt., attached R.F.C., whose death was announced last week, was born at Jerusalem in April 1894, and was educated at Clare House, Beckenham, and Trent College. In August, 1913, he was gazetted to a commission, and in September, 1914, he was sent to France in charge of a draft, and a month later was severely wounded at La Bassée. This incapacitated him for active service for the next 14 months, but for the last six months he was able to do duty with the regiment at home.

He was promoted Captain in February, 1915, being then not yet 21, and in December of the same year he took a draft to Mesopotamia, where he served for eight months, at the end of which illness compelled his removal to hospital at Bombay. When about to return to Mesopotamia he was recalled for training in the R.F.C., and he returned home last January. He had completed his course, and was on the point of receiving his wings when he met his death while flying at an aerodrome in England.

WILLIAMS.—Sec. Lt. Vaughan Floyer Williams, R.F.C., whose death was announced last week, was educated at St. Edmunds, Hindhead, and at Rugby (Mr. St. Hills), and joined the R.F.C. a few days after leaving school in July, 1916. He obtained his wings in the following October, and went to the front at the beginning of this year. He was home on leave in the latter part of March, and was killed the day after he rejoined his squadron.

ENGAGEMENT.

SKIDMORE-JONES—TOTTENHAM.—An engagement is announced between Clifford J. Skidmore-Jones (Corporal, R.F.C. Wireless), only son of Mr. and Mrs. Skidmore-Jones, Cromer House, Halesowen, and Muriel Tottenham, daughter of the late Rev. Mr. Tottenham, formerly rector of Thurning, Oundle, and of Mrs. Tennant-Austen of Glenfarne, Astwood Bank, Warwickshire, and Bournemouth.

* * *

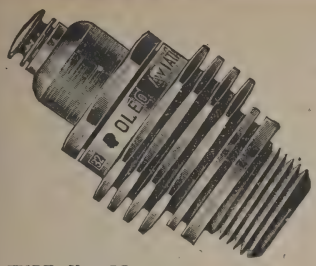
The marriage arranged between Mr. Ralph Knott, R.F.C., and Miss Josephine Sullivan will not take place.

MARRIAGES.

BARRINGTON-BAKER—NEAL.—On July 30th, at St. Mary Abbott's, Kensington, Lt. Montagu Barrington-Baker, R.F.C., son of the late Rev. Charles Baker, was married to Dorothy Francis, youngest daughter of Mr. and Mrs. Neal, of Kensington, by the Rev. Herbert Allen, M.A.

FERGUSON—FERGUSON.—On August 2nd, at St. Peter's Church, Regent Square, Lt. Ronald Ferguson, R.F.C., youngest son of the late Capt. Hugh Ferguson and Mrs. Ferguson, New Brighton, was married to Dorothy, youngest daughter of the late Capt. H. S. Ferguson, Rosario, Argentine Republic, and Mrs. A. Ferguson, "Boxholme," Buxted, Sussex, by the Rev. C. W. Steffan.

HOLLAND—BREACH.—On July 28th, at the Parish Church, Steyning, Capt. Sydney Henry Holland, the Queen's R. W. S. Regt., attached R.F.C., son of Mr. and Mrs. Arthur Holland, Dunedin, Horsham, was married to Cicely, daughter of W. Powell Breach, J.P., Sussex, and Mrs. W. Powell Breach, Newham, Steyning, by the Rev. A. Congreve-Pridgeon, B.A., Vicar.



MILNE—HANMER.—The marriage of Capt. John Milne, M.C., R.F.C., elder son of Mr. and Mrs. Jack Milne, of The Brook House, Sutton Courtenay, Berks, to Joan, younger daughter of Mr. Thomas Hanmer, took place at Sutton Courtenay on July 24th, the Rev. E. B. Mackay officiating. The honeymoon was spent at the Norman Hall, Sutton Courtenay, kindly lent by Mr. and Mrs. Dudley Cory-Wright.

SEELY—NICHOLSON.—The marriage of Brigadier-General the Right Hon. J. E. B. Seely, C.B., D.S.O., M.P., of Brooke House, Isle of Wight, to the Hon. Mrs. George Nicholson, widow of Capt. George C. N. Nicholson, R.F.C., and youngest daughter of Viscount Elibank, took place on July 31st at St. Ethelburga, Bishopsgate, the Rev. Dr. Cobb officiating. The bride was given away by her father-in-law, Sir Charles Nicholson, Bart., M.P., and Major Sir Archibald Sinclair, Bart., 2nd Life Guards, acted as best man.

Sec. Lt. R. J. Grandin, A.S.C., attached R.F.C., has been missing since May 18th. Will those communicating with R.F.C. officers now prisoners in Germany, either in hospital or camp, kindly inquire as to the fate of the above?—Any information will be gratefully received by Mrs. R. J. Grandin, 58, Anson Road, N.

CHADWICK, SON AND NICHOLSON, Solicitors,
Dewsbury.

The special correspondent of the "Morning Post" writing from the British front of the offensive operations then in progress on the Ypres front on August 1st, says :—

The battle has been a signal triumph for the gunners as well as for the infantry, while the Flying Corps, prevented by the weather from playing their usual part, took part in the operations in a new guise, and as "cavalry of the air" many venturesome pilots distinguished themselves in the advance against the enemy. Flying extremely low, owing to the haze, they engaged machine-gun redoubts and posts single-handed, and several hostile strong points were silenced by their fire.

It was the first great battle of this war fought entirely without the assistance of aeroplane observation—the opposing armies were as blind as though aircraft had never been invented—and our machines did not turn in a single battery call. Nevertheless, they did great service as "flying cavalry." Some intrepid craft dropped so low that they nearly brushed the concrete forts with their wings, and they raked the trenches around them before the occupants could try to reply.

* * *

The special correspondent of the "Morning Post," writing from the British Front on August 2nd of the present offensive, says :—

The part played by "the Cavalry of the Air" in Tuesday's battle included some of the most remarkable exploits yet performed by the adventurous young gentlemen of the Flying Corps. Rain and low-lying clouds rendered them useless for scouting in their usual positions high above the advancing armies, so they fought the Germans in the mud instead of in the air.

Heedless of "Archies," machine-guns, revolvers, and wild barrages by rocket batteries, they sailed low over our mud-stained infantry, noted their position, and came back with their accurate sketch maps of ground which they had hastily pencilled in the cloud with blind shells cracking all around them. But most wonderful of all were the duels with motor-cars on the roads, German troops in column, aerodromes, and miscellaneous units discovered by these keen-eyed scouts in the Flemish fields and villages behind the enemy's battle-front.

It must be remembered that the weather was extremely bad, with cloud banks only five hundred to a thousand feet above the plain. Yet, despite conditions which could hardly have been worse, one formation alone flew for 396 hours on Tuesday, fired over 11,000 rounds of machine-gun ammunition, all at ground targets, crashing down six Hun aeroplanes, and setting alight one balloon.

Here is the experience of one fighting pilot. He started at four o'clock in the morning, at the beginning of the battle, when the light was still bad, and flew over canals and roads in the invaded territory to a certain German aerodrome. One workman was walking across the ground, and he paid no attention to the sky, evidently confident that it was impossible for a hostile machine to attempt an attack. Lieutenant X. dropped a bomb neatly on one shed. Men appeared running in all directions. The machine sailed along one side of the aerodrome low enough for the pilot to fire his machine-gun into the open doors of the sheds as he passed, then swerving across to the other side he bombed a second shed. Hardly had the bomb exploded before the pilot was back again, bombing a third shed opposite. Lieutenant X. aimed a bomb at a fourth shed, but the release lever did not work, so he went up into the clouds and leisurely adjusted it, dropping a few moments later into clear air just above the aerodrome. His fourth bomb fell between a shed and a railway train, damaging both of them.

By this time the Germans had recovered sufficient presence of mind to bring a machine-gun into action, so the aeroplane flew angrily at the gun, firing in reply, and scattering the enemy crew in all directions.

Then Lt. X. sailed once more past the open sheds, firing into them until the ammunition in his gun was exhausted. Again he climbed into the friendly clouds just above, changed his drums, and slipped down with his machine-gun replenished, actually touching the ground between the sheds. He emptied the drum into the aerodrome at various angles—not a soul was to be seen—and apparently this satisfied him. He flew away. A little distance down the road he came upon two German officers indulging in a morning ride. He dived at them and fired, and their horses bolted.

Then he sighted a column of about 200 infantrymen marching along the muddy road. He flew just above their heads, and his machine-gun chased them into the fields and hedges. Again he changed his drums in the clouds. When he came back for a third bout in the open country, two enemy machines, which were apparently seeking him at the frenzied request of the harassed aerodrome, drove at him, but he sent one crashing down and the other thought better of it and went away. As he circled back he saw German soldiers collecting around the wrecked machine in a field, so he fired into them. A number ran away, others lay down, and he undoubtedly killed some of them. This appears to have exhausted Lt. X's. ammunition, and he came home.

Even more remarkable was the morning flight, in the first hour of the battle, of an eighteen-year-old aviator, who was allowed out alone for the first time. He started with another machine, but soon lost sight of it in the clouds and was entirely left to his own resources. The first target that caught his eye behind the German lines was an open motor-car containing three officers. He dived down and fired into it. The car swerved drunkenly into the side of the road, nearly overturning, and when the boy saw

THE VICKERS "GUN-'BUS."—The first successful aeroplane designed specifically for fighting. During 1915 and 1916 these machines, with 100-h.p. Monosoupape Gnôme engines, did excellent work in France, and continued to do so long after they should have been considered out of date by any thoroughly organised supply department.

this he circled back, swooped down, and recommenced firing. An officer in the back seat pulled a revolver out of his holster and returned the fire.

Here was a real duel. Our young knight of the air shut off his machine-gun and responded with his own automatic pistol—generously determining to meet his adversary with his own weapons. He was only twenty feet behind the car when it drew up suddenly in front of a cottage, and he saw the occupants of the car carrying one of their number, dead or badly wounded, into the house. He wheeled and fired repeatedly into the roof of the cottage with his machine-gun. Then he returned and fired a Véry light into the motor-car, hoping to set it on fire.

Another aviator, who went out in the dawn to bait German aerodromes, found a camp of tents around a cottage, where men were washing in the open, and sent them panic-stricken to every point of the compass. Still another, who dropped at an aerodrome, saw mechanics working inside a shed, and poured a stream of bullets through the open doors.

* * *

On August Holiday Monday at Aldershot, the administrative wing of the Royal Flying Corps held a successful meeting. Among the winners were: 100 yards, Air Mechanic Copp; half-mile, Air Mechanic Chapman; quarter-mile, Sergeant Bennett; long jump, Cadet Portman; high jump, Cadet Phelps; mile, Air Mech. Smith; 220 yards, Chief Mechanic Perry; 660 yards, Air Mechanic Chapman.

FRANCE.

Official Communiqués.

August 1st.—Captain Guynemer has won his 50th victory.

August 2nd.—Between July 21st and 31st, 20 enemy aeroplanes and two kite balloons were brought down. During this same period 21 aeroplanes were hit and fell in their own lines.

Lt. Marcel Hugues has brought down 5 German machines.

During the above-mentioned period a dozen of our squadrons made numerous raids and bombarded, among other places, the railway stations of Roulers, Metz, Thionville, Montmédy, and Bétheniville, the Hagondange Works, the cantonments and bivouacs in the Forest of Houthulst and Spincourt, and in the Valley of the Suippe, and munition dumps in the Laon district. About 40 tons of bombs were dropped in these raids, which caused much damage.

Army of the Orient.—Bombardments of enemy installations have been carried out by British aviators in the Ghevgeli and Demirhissar zones and by French aviators to the north of Monastir and to the north of Koritza (in Albania).

August 3rd.—Army of the Orient.—Allied aviators bombarded the enemy camps in the region of Demirhissar and that of Lake Malik (south of Lake Ochrida).

* * *

The French Ministry of War announced on August 1st that Capt. Guynemer has won his 50th air victory.

As the successes of French aviators are most scrupulously investigated before they are credited to them, it may be taken that the official announcement means that Capt. Guynemer has destroyed 50 German aeroplanes. It does not at all follow that this is the total number of enemy machines that he has driven down. Guynemer's wonderful record is the work of about two years. As a Sergeant-Aviateur he had brought down his fifth machine at the beginning of February in last year, and, in the interval, he has accounted for 45 other enemy aviators, and been promoted progressively to the rank of Captain. He heads the list of victorious French aviators, and has been decorated with the Legion of Honour, the Medaille Militaire, and the Russian Cross of St. George. He has also achieved the distinction of bringing down four of his enemies in one day.

* * *

It is reported that a German aviator dropped bombs on the German prisoners' camp at Amiens on July 30th.

GERMANY.

Official Communiqués.

August 1st.—Front of Crown Prince Rupprecht.—The brilliant bravery and dash of our infantry and pioneers, the heroic endurance, and the excellent effect of the artillery, machine-guns, and mine-throwers, the intrepidity of our aviators, and the most faithful fulfilment of duty on the part of scouts and other auxiliary arms, and especially the purposeful, quiet leadership, offered certain guarantees for the termination of the battle day in our favour.

August 6th.—In an aerial fight, Lt. Gontermann shot down his 25th opponent.

* * *

A message from Amsterdam, dated August 5th, states that, commenting on the recent speeches of Mr. Lloyd George and Sir Edward Carson, Count Reventlow says in the "Deutsche Tageszeitung": "Our best answer to each of these insolent speeches would be sprinkling London with bombs every time they are delivered."

RUSSIA.

Official Communiqués.

August 2nd.—On July 31st a number of enemy machines appeared seven times at various points along the coast and the islands of the Gulf of Riga. At Mentoi and Arensburg they dropped 20 bombs without results. The enemy machines flew as far as Kujvast (near the mainland), where they were met by artillery fire.

An enemy Zeppelin flew over Tserel (southern extremity of Oesel Island, north of the Gulf of Riga).

A squadron of our aeroplanes, consisting of 24 machines under the command of Lieutenant-Colonel Konovaloff, made a flight over St. Voigiany (on the Lida-Molodetchno railway); over 60 bombs were dropped.

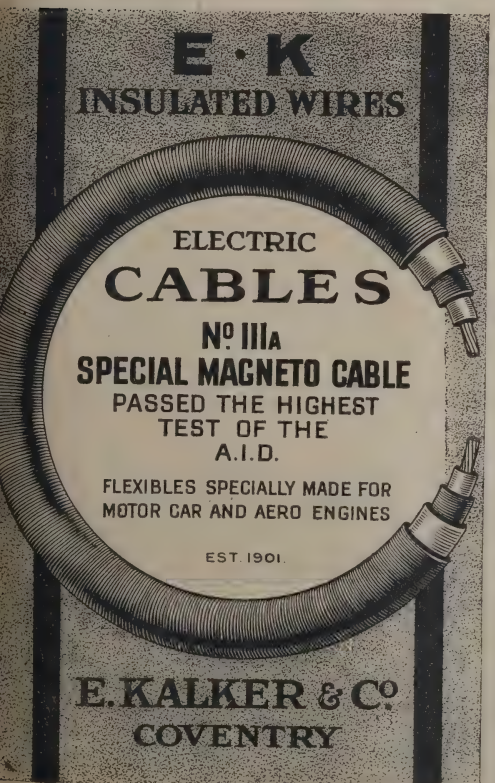
Enemy aviators dropped bombs on the village of Mikh Nev (to the south-east of Smorgon) and on Sinaev.

August 3rd.—Aviation.—In the region of Khotin our aviator, Sec. Capt. of Cavalry Kozakoff, brought down his 15th enemy aeroplane, the Austrian occupants of which were taken prisoners.

August 6th.—Aviation.—On the night of August 5th our aeroplanes made a flight over the railway station of Baranowitschi and dropped a number of bombs. Direct hits on the station were observed.

ITALY.

Official Communiqués.



July 31st.—This morning an enemy machine was brought down in flames near Podgora (on the right bank of the Isonzo, opposite Gorizia).

August 3rd.—Above Tolmino one of our aviators brought down one enemy machine in flames and obliged another to land in its own lines, where it was afterwards destroyed by our artillery. Last night our large flights effectively bombed the arsenal and

Back View of the Vickers "Gun-'Bus," with 100-h.p. Monosoupape Gnôme engine. The most successful two-seater "pusher" machine of the 1915-16 period of the war.

military works of Pola, all returning safely to their bases. Enemy machines carried out a bombing raid on some inhabited localities on the Lower Isonzo, causing a few casualties and doing slight damage.

August 4th.—During the air fights of the 2nd inst. a third enemy machine was brought down besides the two already reported.

Last night our flights renewed the bombardment of the arsenal and military works of Pola, causing great destruction and big fires, which they were able to observe before returning safely to their bases.

August 5th.—During the night of the 4th enemy aircraft carried out bombing raids on various inhabited centres on the plain between the Isonzo and the Tagliamento, but there were no casualties, and only slight damage was done. An enemy seaplane was brought down by our anti-aircraft guns and fell in the River Po, near Ponte Lagoscuro, the aviators being made prisoners.

* * *

The following account is taken from the dispatch issued by the Italian General Staff at General Headquarters of the aerial operations on the Italian fronts from March to June, 1917:—

During this period of the offensive the Italian aviators took a conspicuous part in brilliant air fighting, in patient and continuous reconnoitring flights, and in successful bombing raids.

Thirty-five Austrian machines were brought down in air fights or by anti-aircraft guns.

Large quantities of explosives were several times dropped on the Austrian railway lines and on their points of assemblage at Volcia Draga, Rifemberga, Opcina, S. Daniele (Branizza), S. Lucia (Tolmino), in the Adige and Brenta valleys, and on the Asiago plateau.

The Vipacco valley, where Austrian troops and hutments were massed, and where there was intense convoy and artillery traffic, was bombed day and night by airships and aeroplanes with successful results.

Veritable air battles took place on May 23rd over the Austrian lines at Medeazza and Flondar, and on June 19th during the fighting in the Mt. Ortigara area. During these battles reconnoitring aeroplanes preceded in the vanguard to discover the enemy guns, the big battle-planes followed closely, dropping immense quantities of explosives on the enemy's trenches, and even flying low enough to attack with their machine-guns, while chasing 'planes effectively carried out their work of protection by engaging the numerous enemy machines who attempted to repulse them.

The Italian Army has thus victoriously entered on its third year of war, proving by its great increase in material and continued progress in organisation that it is ably seconded by an incessant display of physical and moral energy on the part of the entire nation in arms, which, conscious of the value of the work done and of its own strength, has perfect faith in the final victory.

HOLLAND.

The "Telegraaf" (Amsterdam, August 5th), learns from Nes, Ameland, that a German aeroplane has landed there owing to engine trouble. The two occupants have been interned and the aeroplane, numbered 931, has been taken to Nes village.

A German seaplane came down at 6 a.m. on August 6th near Cocksdorp, on the Island of Texel, after it had been fired at by Dutch soldiers. The seaplane, No. 1,101, was a large biplane, built at Friedrichshafen in April. It came from the North Sea and was short of petrol. The aviators have been interned.

U.S.A.

Charles Fleischmann, son of Mr. Julius Fleischmann, the multi-millionaire yeast manufacturer, and his companion, Harry Witts, were drowned on August 3rd while flying a seaplane at Great South Bay (between Fire Island Beach and Long Island). Something went wrong with the engine, and the machine dived from 600 ft. into about 6 ft. of water, the aviators' bodies being driven right down into the mud and completely buried. It is presumed that something went wrong with the controls of the machine.

THE AERONAUTICAL SOCIETY.

New Members.—The following have been elected members of the Society in the various grades:—

Associate Fellows.—William Herbert Hatfield, D.Sc.; Edgar Alfred Allcutt, A.M.I.C.E., M.Sc., A.M.I.M.E.; Samuel Turner; Ivan Owen Williams, B.Sc., A.M.I.C.E.; Henry Edgar Broadsmith.

Members.—Frank Bernard Harford, Capt., R.F.C.; Albert Edward Banert; Carleton George Chapman, Capt., Aviation Service, U.S.A. Army.

Associate Members.—William R. Catesby; William Stevenson Storie; Arthur W. Cutbill; C. H. Wallis.

Student Members.—Charles Watson Hall; Laurence Dove; Edwin H. Moyes; George Isaac Price.

THE N.P.L. AGAIN.

The following letter has been received:—

Sir,—In their report for 1912—13, page 77, the "powers that be" at the National Physical Laboratory have applied the term "Phillips Entry" to the underside of an aerofoil. This is not only incorrect, but very unfair. The term should, of course, be applied to the forward upper portion as set forth in my 1884 patent. It is a curious fact that in spite of great expenditure in time and money nobody has yet succeeded in "getting round" the subject-matter of my patent of 1884.

(Signed) Horatio Phillips.

West Barnham, Sussex.
4/8/17.

[Mr. Horatio Phillips was the originator of the "Phillips Entry," which is the shape of leading edge very generally used on the most efficient aeroplanes. His complaint brings to notice another example of the careless or unfair way in which the N.P.L. goes about the work for which its officials are so highly paid by an innocent nation.—Ed.]

THE HOME SECRETARY AMONG MUNITION WORKERS.

Sir George Cave, the Home Secretary, and Sir Worthington Evans, Secretary to the Ministry of Munitions, visited the works of Messrs. Gordon Watney and Co., Ltd., on August 2nd.

The visitors were impressed by the splendid results achieved during the past couple of years, especially since the erection of the additional huge workshops, and they could not fail to appreciate the enthusiasm and assiduity of the workers. Throughout their inspection Sir George Cave and Sir L. Worthington-Evans were accompanied by the Hon. R. C. Butler (Chairman of the

Directors of Messrs. Gordon Watney and Co., Ltd.), Major Gordon Watney (Managing Director), Messrs. J. Costigan (General Manager), Cyril Chamberlaine (Assistant General Manager), Dews (Chief Engineer), and H. M. Zillwood (Works Manager).

Passing through the drawing and general offices, the visitors next visited No. 1 machine shop. Here, dealing with the lighter work, women predominate in numbers. Sir George stopped some time to inspect the work on aeroplane engine cylinders, and was much interested in the automatic and milling sections. Passing into No. 2 machine shop, he found a big range of Herbert automatics doing good work in the heavy lathe section. Here, again, women labour was well represented, although the percentage is not so high as in the former shop.

In the tool shop the visitors were shown how the gauges, jigs, and special tools required are produced. No. 3 shop is a heavy section, consisting principally of boring machines, centre lathes, radial drills, and the grinding section. The Home Secretary stopped some time to inspect Clerget crank cases in various stages of manufacture.

The fitting shops were the next call, the visitors being welcomed with the engineer's greeting—the banging of tools on metal.

Evidence of the diversity of the firm's work was shown when the testing stands were visited by the fact that in the stands were a 140-h.p. R.A.F., a 120-h.p. Beardmore, a 130-h.p. Clerget, and two 80-h.p. Gnomes, all being finally and thoroughly tested prior to leaving the factory.

Subsequently, the visitors were much interested in the heat-treatment shop. The brief visit must have convinced the officials that Messrs. Gordon Watney and Co., Ltd., turn out aeroplane engines, right from the bar material to the finished article, and that experts are in charge of every department.

Towards the conclusion of the inspection, the employees, to the number of about 700, assembled in one of the Beardmore sheds for a few brief addresses.

Major Gordon Watney, in a short speech, remarked that Sir George Cave and Sir L. Worthington-Evans were two gentlemen whose whole lives had been devoted to the service of their country. He (the speaker) was anxious that it should be thoroughly demonstrated to Sir George Cave that many of the remarks made in the daily papers did not appeal to the employees of that factory; he was referring to the unrest amongst the engineers. He thought they would agree with him when he said that as between himself and those present there was nothing except the friendliest possible relations, and it was their intention to give the maximum amount that they could possibly give to His Majesty's Government.

Sir George Cave, who was enthusiastically received, said he did not like to make speeches, nor did he suppose they wanted to listen. He had come down with Sir L. Worthington-Evans to see something of the work of a great factory like that. There was no work in the country which could interest them more than such work. They talked, and they talked rightly, of the splendid work their men were doing at the Front both on land and in the air. (Hear, hear.) They were all thinking that day of the great battle which was going on in France and in Flanders—good luck to our soldiers over there. (Hear, hear.) As they knew, unless those men and women and girls, and hundreds and thousands like them, were doing their work at home, they could not hope to win the great victory which they were going to win in France.

Without the support of the men and women in munition works those splendid fellows abroad could not fight their enemies. They had got some grousers in the House of Commons. (Laughter.) He did not find any grousers here. They had got pacifists, too, though he did not find any of them here. They must defend their country and they must fight through this war, cost them what it might.

No trouble justified the cessation or suspension of work of this kind in this country. If there be trouble or if there were grievances, let them hear what they were and they would be met, and for heaven's sake let no man take the grave responsibility of stopping that work, which was essential to the success of our men at the Front, for a week or for a minute. He congratulated the management and themselves on the work which his friend and he had seen that day, and he hoped and knew they would go on with that work till the victory for their country was won. (Loud cheers.)

Sir L. Worthington-Evans congratulated the management and the workers of that factory heartily on the magnificent results of their combined efforts. He congratulated the skilled men, who had been educated to the work, and the "dilutees" upon the quickness with which they had picked the work up, which was not their work before the war, and which was work of the highest skill. He congratulated that happy diluted family from the bottom of his heart. (Loud cheers.) Three cheers were then given for the King, Sir George Cave, Sir L. Worthington-Evans and Major Watney.

THE LABOUR QUESTION AND AEROPLANE OUTPUT.

A correspondent writes to the editor of this paper:—

Sir,—Having read your article under the heading of "Aeroplane Supplies" in the "Observer" of Sunday, July 29th, I am presuming to write to you to express my appreciation of such an able, absolutely truthful, and, to my mind, plucky expression of opinion.

For some years previous to the war, and for some little time after, I was manager for a firm of building contractors and joinery manufacturers, a business which had to be closed down owing to the conditions prevailing. I have since been working as an operative woodworker in aircraft construction, and that is the reason I so appreciate your article.

Waste of Labour.

The wastage of labour that I have experienced is appalling; it is, in fact, wantonly wicked. On every hand one hears the same cry from a large majority of the workmen—"don't do too much"—and so far at no time I know of has any effort been made by the management to get anything like a fair and proper day's work done by an operative.

How these firms are paid I do not know, but this I do know, that neither of the firms I was with could have carried on a month under proper and fair competitive prices. For weeks I and hundreds of others booked 90 hours per week. In actual time made this means working (or going to work) four days at 12 hours, one day at 11, one day at 9, and one at 8 hours, 76 hours actual time, the balance being the extra allowance for overtime. Many has been the week that not 10s. worth of work has been done by any one of us, and we received close on £5.

Waste of Time.

My first experience was on a machine engined with a 80-h.p. Gnome, giving 73-83 m.p.h., fitted with machine-gun and bomb-dropping gear. The machines were elaborately finished, emblazoned with the coat-of-arms of the city in which they were made. What each one cost I do not know, but were they worth 2d. each? And to the brave fellows who had to fly them, I contend, they were a danger. I expressed this opinion there, and was taken off them. I do not know that my expression had anything to do with this—in all probability not.

There were a number of seaplanes in for overhauling and repair—eight, I think. I and seven others were put to work on one of them, and for 16 weeks we fiddled about this machine, and in addition there were three or four fitters, several girls, two trimmers and two painters, all of whom put in about the same time. When we had finished with it, and had wasted another two days while it was tested, the planes were removed and it was trundled to a railway station, taking another day, and as it was late when we came away from the goods yard we were booked 15¾ hours for that day, 15 of us, I believe. Then four men were sent to Dover, I believe, to re-assemble it, taking another week to ten days.

That machine was out of action for six months all told, and I fully and honestly believe that all that was really necessary was for the fabric's removal, a repair to the fuselage owing to a previously made bad joint, the planes tuning up, the engine and controls overhauled, and bomb-dropping gear fixed, at an outside cost of £200, and she ought not to have been out of action for more than a month.

Waste of Material.

I asked for my discharge and left this firm, starting for another one in the same city, only to find pretty much the same conditions prevailing. A little improvement, perhaps, in the management, and they certainly were turning out a machine that was speedy and serviceable, with not so much attention paid to spit and polish, so dear to the heart of the A.I.D. But this firm under good management could increase their output very materially without employing a bigger staff; in fact, I believe, double it.

I believe the cause of a lot of the labour unrest in aircraft factories is owing to the fact that men have too much time to brood over their grievances and to chatter to one another about them. I have had quite a lot to do with management of workmen, and I fully believe in paying them well, and the pay at present applying in this industry is not quite what it ought to be for the skilled and industrious workman.

Further, I feel certain that the hours worked, such as I have indicated, are not conducive to quick and economical production.

Your suggestions are, I think, excellent, and I sincerely hope will receive the consideration they deserve. It is more than likely I have bored you with a good deal of what I have written, and my only reason for writing you at all is that you are the only writer of all whom I have read who has hit the nail in the right place. I should like to say all I have written of has happened during this year, and the machine I first refer to is still being made.

Aeroplane Construction

In aeroplane construction the vital factor is "how many machines can be turned out in a given time." This depends entirely upon the efficiency of the machinery employed. And no machine reaches its highest point of production until its clutches, brakes, etc , are fitted with Ferodo Fabric.

Ferodo Fabrics are the most efficient transmitters of energy. Leather, wood, textile beltings, etc., are out of date for Friction drives and Braking purposes. The moment they become soaked with oil they are useless; Ferodo Fabrics never slip, never seize; are not affected by water, oil or acid, and are absolutely reliable under all conditions.

THE CURTISS CORRUPTION CHARGE.

At Bow Street Police Court on August 3rd William Augustus Casson and Wing Comdr. John Cyril Porte, R.N.A.S., were charged before Sir John Dickinson with un'awfully conspiring together and with Lyman J. Seeley to contravene and set at naught the provisions of the Prevention of Corruption Act, 1906, in respect of large sums of money received by Porte, as agent of the Crown, in respect of contracts made between the Lords Commissioners of the Admiralty and the Curtiss Aeroplane Company, of New York.

The Attorney-General (Sir Frederick Smith), Sir Archibald Bodkin, and Mr. Roome represented the Director of Public Prosecutions; Sir George Lewis appeared for Comdr. Porte, and Mr. W. J. Synnott for Mr. Casson.

In his opening statement the Attorney-General said the Act under which the proceedings were taken was obviously directed against secret gifts by which a principal was practically made to pay a commission to his own agent. The matters involved in this case were discovered in the course of an inquiry made by direction of the First Lord of the Admiralty and presided over by Mr. Butcher, K.C., relating to transactions between the Admiralty and the Curtiss Aeroplane Company.

Sir F. E. Smith related how in 1914 Comdr. Porte went to America in connection with a scheme for flying in a seaplane across the Atlantic. The defendant Casson was also interested in that scheme, and was an old and intimate acquaintance of Comdr. Porte. The machine that was to fly across the Atlantic was one of two boats constructed by the Curtiss Company in July 1914, but the outbreak of war in the following month put an end to the project. Lyman J. Seeley (whose name was mentioned in the charge) was an American citizen who in 1914 was appointed publicity manager of the Curtiss Company in England, with a salary of £200 a year and 1 per cent. on all sales effected by him. There seemed to have been a verbal arrangement between Comdr. Porte and Seeley by which Comdr. Porte was to receive 20 or 25 per cent. of the selling price of all flying machines for which he obtained the order.

[This was before the war when Comdr. Porte was on the retired list, and had been engaged in the Aircraft Industry for some years.—Ed.]

When the outbreak of war put an end to the project of flying across the Atlantic, Comdr. Porte returned from America to England, and it was then proposed that the Curtiss Company's twin flying boats should be brought over here and offered to the Admiralty. From that point the case to be presented against the defendants depended very materially on the evidence given at Mr. Butcher's inquiry to which Sir F. E. Smith had already referred.

Comdr. Porte, after the outbreak of war, received a commission from the Admiralty in the R.N.A.S., and he was also commissioned to get an estimate from the Curtiss Company not only for the twin seaplanes or boats, but also for other machines. The result was that the seaplanes were bought by the Admiralty and delivered in October. All this time Mr. Casson and Comdr. Porte were in close association, and Comdr. Porte informed Mr. Casson of the 25 per cent. arrangement between himself and the Curtiss Company.

Mr. Casson knew of the favourable opinion the Admiralty had formed of the Curtiss machines, but he was also alive to the difficulties which might arise under the first section of the Prevention of Corruption Act. An arrangement was therefore made that Comdr. Porte should ostensibly give up all his business connection and transfer to Mr. Casson all his interests in the Curtiss productions under his agreement with Seeley on condition that Mr. Casson should discharge all duties in connection with that matter, and proceed when necessary to America at his own expense.

The object of this arrangement obviously was that if ever any question was raised it could be made to appear that Comdr. Porte had not benefited during the war from any transactions with the Curtiss Company, and then, after the war, Mr. Casson could, if he felt inclined to do so, deal fairly with Comdr. Porte. Such was the arrangement in writing, but the real arrangement between these men was a verbal one. It was to the effect that Mr. Casson should be put forward as the person dealing with the Curtiss Company; that Comdr. Porte's name should be kept out of it, and that all the profits—20 or 25 per cent.—should be nominally received by Mr. Casson, but should be afterwards divided in the proportion of three-fourths to Comdr. Porte and one-fourth to Mr. Casson.

Sir F. E. Smith went on to state that, needless to say, nothing in regard to that secret arrangement was disclosed to the Admiralty. A number of orders were subsequently given by the latter to the Curtiss Company through Comdr. Porte. At some time during the execution of these orders Seeley arrived in London and had interviews with Mr. Casson, with whom he made further arrangements about dividing commissions—that is, between Seeley as agent for the Curtiss Company and Mr. Casson as agent for Comdr. Porte, or as intermediary between the Curtiss Company and the Admiralty.

The ultimate arrangement was that Mr. Casson was to receive 15 per cent. on all the Company's Admiralty orders, but was to divide this 15 per cent. with Seeley, who would also get his direct commission of 1 per cent. from the Curtiss Company. This arrangement having been made, Comdr. Porte introduced Seeley to the Admiralty as the representative of the Curtiss Company, and large orders for aeroplanes, seaplanes, etc., were sent through him. The arrangement between Mr. Casson and Comdr. Porte was that of the 15 per cent. the former received from the company 7½ per cent. should be returned to Seeley, and that of the other moiety three-fourths should go to Comdr. Porte and one-fourth to Mr. Casson.

So large was the business done between the Admiralty and the Curtiss Company that in 1916 the orders placed with the latter reached eleven million dollars, of which five million dollars' worth had been delivered and six million dollars' worth paid for. Under the agreement already described, the remittances to Seeley by way of commission seemed to have totalled some £64,000, and of three-fourths of that sum Mr. Casson appeared to have regarded himself as the holder in trust for Comdr. Porte, on whose behalf he had meanwhile made certain payments and some investments, whilst he had retained about one-fourth, or £16,000 odd, for his (Casson's) own benefit.

Sir F. E. Smith argued that for that he had done nothing beyond acting as recipient of money which he had not earned, and as to Comdr. Porte, there could be no doubt that he knew all about the commissions which were being paid on the goods supplied by the Curtiss Company. Whether the prices paid by the Admiralty were reasonable or not had no relevance to this matter of corrupt commissions. It was not contended that Comdr. Porte was not a skilled aeronaut and seaplane expert, nor that he possessed valuable knowledge which at the outset of the war he had placed at the disposal of the Government. There could be no doubt that these persons knew that the Admiralty were paying enormous sums of money, some of which went to Mr. Casson for doing nothing. Mr. Casson was on the point of going to France when he was arrested, but it was not suggested that he was absconding. He had in his possession a letter from Comdr. Porte in which the latter suggested that things were going to move.

The case was adjourned until Friday next, and Comdr. Porte was allowed out on his own recognisances in £2,000. Mr. Casson was admitted to the same bail as before.

During Sir F. E. Smith's indictment, Comdr. Porte was seized with a fit of coughing, caused by the lung trouble through which he was invalided out of the Navy in 1911. This brought on hæmorrhage of the lung and he collapsed in Court. It will be remembered by those who have served with Comdr. Porte that he has suffered from tuberculosis for some years, and took to flying largely in the hopes of improving his health.

AVIATION IN JAPAN.

"L'Aérophile" for July 1st-15th contains some interesting notes about aviation in Japan, extracts from which are reproduced hereafter.

The part played by Japan in the development of aeronautics has been small, but private and public enterprise has achieved something. The visit of the American pilots, Art Smith and Charles Niles, did a great deal to stir up interest.

There have been differences of opinion in Europe and America as to the relative merits of airships and aeroplanes. So in Japan. The first Japanese aeronaut preferred the "lighter than air machine," and the balloon, "Yamada," played a great part in the Russo-Japanese war. Yamada, who died about two years ago, and who had studied much, was at the time of his death experimenting with various kinds of silk and other material with which envelopes are usually constructed. He remained until the end a fervent supporter of the airship.

The world, meanwhile, has decided in favour of "heavier than air," and Japan has wisely followed its lead.

The country has much for which to hope from the National Aviation Society, which was founded in 1914, and has since been very active. Other associations have been founded for the encouragement of particular activities.

The National Society has grown largely, and now possesses many thousands of members who believe firmly in aviation, and that Japan should take part in its development.

On several occasions the Society has announced the existence of three prizes from 20,000 to 50,000 yen for the best Japanese motor, as encouragement to the indigenous engineers. The results of these offers have not yet been made public. A large number of plans have been sent in, but apparently none have materialised. There is, however, no doubt that the Japanese are paying great attention to aeronautical motors, and are convinced

PORTABLE

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

that their country should not rest content to copy, and that the active brains of the Eastern World should solve the great problem of the air.

Meanwhile, a machine built by Dr. Kishi, fitted with a motor also built by him, has done extremely well. It recently flew over Tokio, and it is said that numerous examples are to be built for the Army.

Encouragement is not lacking in other directions in Japan. The Imperial Aero Club recently received 10,000 yen from Mr. Soga Osaka to construct an aeroplane for looping the loop. This machine, whose construction is nearly complete, is equipped with a 90-h.p. motor, and will be flown by Mr. Osaka, son of the late Minister of Justice, who is learning to fly in Japan, and who will teach himself to loop.

Military aviation is developing. The grand military manœuvres have taken place at Kyushu in the presence of the Mikado. Several new methods were introduced on that occasion. In previous manœuvres only seven or eight machines figured in the operations. Last time 17 machines took part. The offensive and defensive armies had eight machines each, and the investigations of the officer pilots assisted the success of the two armies. The machines were used for night operations, and illuminating bombs were employed for watching the movements of the opposing troops.

A military review at Fukuoka succeeded the manœuvres. The 16 aeroplanes which took part flew overhead in battle formation at intervals of 300 metres.

Four Japanese (military) aeroplanes flew recently from Tokorozawa to Fukuoka, about 420 miles, without landing.

At the present time there is only one aviation station at Tokorozawa, but credits have been requested for the establishment of a station at Kagamiliara Jifu. It is believed that the whole aviation service will be reorganised very shortly.

OPPORTUNITIES IN CHINA.

A regular reader of The Aeroplane in China writes:—

On the subject of aviation in general in China, I regret to have to say that up to the present very few have taken an active interest in this science. Very few people could tell you the difference between a biplane, monoplane, and triplane, and I could almost say that the number who could correctly name a dozen differents parts of an aeroplane could be counted on one's fingers.

Folk in China have nevertheless had one or two opportunities of seeing actual flying. As far back as 1913 Shanghai was visited by an aviator, who, unfortunately, came to an untimely end on the Shanghai racecourse during a meeting there. Although I was not out here at the time, I can well remember reading about this, and since I have been out here I have endeavoured to obtain details of the catastrophe, but, as indicated in my previous remark on the ignorance of the people on the question of aviation out here, the details are somewhat confusing. Some say the machine was a monoplane of the Blériot type, others a biplane of the Farman type. From the various accounts that I have heard I have come to the conclusion that the cause of the fatal accident was that the aviator was trying to do things with a machine that although as good a one as was then made, was absolutely a death-trap when asked to perform feats that our present-day pilots would think twice about doing. However, this is old history now, and I will come to more modern events.

Miss Katherine Stinson, a Canadian aviatrix, has recently been touring this country with two biplanes of American design, and has met with quite a fair amount of success. Her exhibition included looping the loop, volplanés with engine stopped to within a few feet of the ground and then switching the engine on again and rising over the heads of the assembled crowd, etc. This latter performance I consider was an extremely dangerous exhibition, both from the spectators' point of view as well as from the pilot's, and one that should have been discouraged.

In Shanghai Miss Stinson unfortunately had bad luck with her engines, Gnômes, and was unable to fly on the advertised dates, but she showed her ability to fly about a week later when things had been put right.

The Chinese are a peculiar people, and I would advise anyone who may contemplate giving exhibitions in this country in the future to see that everything is in order before they advertise themselves, for inability to fulfil one's contract when Chinese have paid to see something might lead to ugly demonstrations. This latter piece of advice might well have been given to Miss Stinson, as it was only through the good offices of some of the police authorities and foreigners that her machines did not get badly damaged.

At Pekin Miss Stinson met with great success, and was the recipient of several tokens of appreciation from the powers that be in that place. At Hankow Miss Stinson's contemplated exhibition was knocked on the head by a misunderstanding of her manager, a gentleman who evidently thought that as Pekin had shown so much enthusiasm he would only have to say "I want this place for the exhibition," and no one would say him nay, but he found otherwise.

The only suitable ground was the Chinese racecourse, and on arrival in Hankow Miss Stinson's manager advertised that an exhibition would be given on that ground. Unfortunately the Chinese Race Club Committee thought otherwise and politely informed him that as they had made arrangements to have their course and approaches put in order at the time when Miss Stinson required it, they were very sorry, but they could not let the exhibition take place. The exhibition had therefore to be given up, much to the regret of a large number of would-be spectators.

The moral of this incident is, Don't think that you have only to tell Chinese that you want something and it is yours. The Chinese have a thing that they call 'loss of face,' and if they think that there is any chance of losing face they will do their best to do away with the chance. Approach a Chinaman through the proper channels, and there is very little that one cannot do; approach him through the wrong channels, and there is very little one can do.

From Hankow Miss Stinson went to Nanking, where successful flights were made. This is our most modern example of the science of aviation that we have had in this country.

At Pekin I believe the military authorities do attempt to run an aviation school, but with what success I am afraid I can't tell you. I don't believe any aeroplanes, apart from Miss Stinson's, have been imported into this country for a long time past, so if they are running this school at Pekin it must be with very antiquated machines.

In my opinion there is a great field for an enterprising firm of aeroplane makers in this country, and I feel convinced that should any British firm take the opportunity of being the first firm to manufacture aeroplanes and to establish a school they would find it a very paying proposition. I sincerely hope that you will be able to interest some good firm to take a trip, at all events, out to this country to see for themselves the possibilities. If a British firm does not do so, it is a ten to one chance that an American firm will, and after they have fully established themselves some one in the old country will wake up and find that what might have been a good market has been lost to them through lack of enterprise.

LANDSHIP versus AIRCRAFT.

Mr. Philip Gibbs, of the "Express," writing of the tanks in Flanders, says:—

One fight did take place with a tank, and it is surely the most fantastic duel that has ever happened in war. It was queer enough, as I described a day or two ago, when one of our aviators flew over a motor car and engaged in a revolver duel with a German officer, but even that strange picture is less weird than when a German aeroplane flew low over a tank and tried to put out its eyes by bursts of machine-gun bullets. Imagine the scene—that muddy monster crawling through the slime, with sharp stabs of fire coming from its flanks, and above an engine with wings swooping round and about it like an angry albatross, and spattering its armour with bullets. It was an unequal fight, for the tank just ignored that waspish machine-gun fire, and went on its way with only a scratch or two.

[This deserves to go on record as the first example of a fight between aircraft and land-ships. Reference to The Aeroplane of a year or so ago will disclose a statement that war in the future will consist largely in fleet actions between forces of land-ships with aerial scouts. So far the land-ship question has been even more grossly mishandled than the aircraft question, but eventually both will come into their own, and open warfare will result. The passing phase of trench war will then pass for ever.—C. G. G.]

AN ACADEMIC HONOUR.

The research medal awarded annually to an old boy of University College School for original work in any branch of experimental science has this year been granted to Captain and Flight Commander Geoffrey Terence Roland Hill, R.F.C., attached to the Experimental Flying Department, whose researches have added in many important ways to the efficiency of aircraft construction. He is not only a scientific constructor of aeroplanes but a practical pilot, and was awarded the Military Cross last October for having "attacked an enemy kite-balloon under very difficult circumstances, and continued firing until he was within 20 ft. of it. He was then only 1,000 ft. from the ground, and under heavy fire from anti-aircraft and machine-guns, but on looking round he saw the burning wreckage of the balloon on the ground."

Mr. Hill was unable to attend the prize distribution of University College School on Friday, and the medal was taken on his behalf by his father, Dr. M. J. M. Hill, Astor Professor of Pure Mathematics in the University of London.

PRESENTATION AEROPLANES.

Already 100 war aeroplanes have been presented to the R.F.C. through the instrumentality of the Over-Seas Club, General Buildings, Aldwych, W.C.2, and its members and friends in all parts of the world. On August 3rd, to mark the completion of the third year of the war, a cheque for £13,500 was handed to the Director-General of Military Aeronautics. This represents eight additional machines, namely :—

No. 101.—Mr. Walter Greenacre, of Durban.
No. 102.—"Shanghai Race Club No. 4," per Mr. H. H. Read.
No. 103.—"Hong-kong No. 7," given by Mr. A. R. Lowe, per Mr. J. J. Bryan.
No. 104.—"Hong-kong No. 8," per Mr. J. J. Bryan.
No. 105.—"The Henrietta," given by Mrs. Stromberg, New York.
No. 106.—"Chicago," from several Chicago citizens.
No. 107.—Christchurch branch of the Over-Seas Club.
No. 108.—"The Chiefs of Ashanti No. 3."

The money for these eight machines has been received during the past eight weeks, so that practically the Over-Seas Club and its members are adding one machine every week to the equipment of the R.F.C.

GALLANTRY REWARDED.

The following account from a "Times" correspondent supplements the story recently told in The Aeroplane of the heroism of the French Naval aviators who went to the rescue of British Naval aviators who were brought down off Zeebrugge, one of whom was ultimately captured by the Germans with the men whom he rescued.

The French Commandant, in writing to the captured Enseigne's father, described the son's conduct as heroic. The fire was terrific, the young man's action was watched with the greatest anxiety, and the escape of the whole party from wounds was miraculous. After speaking in the highest terms of the young officer's conduct, the Commandant added that, as orders had been disobeyed, it would have been necessary, had he returned, to place him under arrest. The further duty had remained to report his conduct, with the result shown in the orders of superior authority. These included an Army Order of the day, recounting the exploit, and adding a palm to the Croix de Guerre, already earned by the Enseigne, and a decree appointing him Chevalier of the Legion of Honour.

An order of the Minister of Marine of a few days later date promoted the Enseigne de Vaisseau to the rank of Lieutenant as a specially deserving case.

His services have also been recognised by the King, who has been pleased to create him a member of the D.S.O. and to confer upon his observer the D.S.M. The King has also conferred the D.S.M. on the crew of the companion seaplane.

The young officer is the son of a French nobleman of the South of France, connected with a British family well represented in the Services.

[It is curious that no mention of the incident appeared in the Press—other than The Aeroplane. There seems no reason why awards to our Allies should not be gazetted equally with those to our own people. The promotion and reward of the peccant aviator, following a reprimand for disobeying orders, is essentially French.—Ed.]

THE RAFANASIAN CREED.

Various inquiries as to the authorship of a particularly telling effort entitled "The Rafanasian Creed," which appeared in this paper some weeks ago, make it desirable to state that the "Creed" arrived anonymously from some person or persons unknown, and that, therefore, it is impossible for the Editor of this paper to give any indication as to the original perpetrator of the outrage.

A STRANGE CASE.

[The following strange case may not appear to have anything to do with aviation. Those who know will know, and others need not know. It is published in order to dispose of wild rumours.—Ed.]

On August 1st Mildred Deborah Platt, 29, of Buckingham Gate, appeared at Marlborough Street on a charge of stealing brooches, value £175, belonging to Joseph Chaumét, a New Bond Street jeweller. Other articles were found at her residence.

The accused, who appeared to be ill, was attended by a nurse.

Dr. Reginald Nitch-Smith, of New Bond Street, said he had attended the prisoner since January last, and had occasion to prescribe heroin for her. It was a drug taken internally or hypodermically, and belonged to the morphia group.

He had seen her on a number of occasions from January to July. He had never seen any ill-effects from the drug.

Mr. Gill said the accused was not in a fit state to give evidence, and she would hand a written statement to the magistrate.

She did so, exclaiming in a low tone, "I am not guilty."

Mr. Denman looked at the statement, making no comment.

Miss Mary Wilson, of Maidenhead, said she had been governess to the accused, who used to take heroin. At times she consumed a bottle of whisky or brandy a day.

Dr. Bulkeley Gavin said he had seen the accused many times. Owing to the drug he did not think she was responsible for her actions. He had done his best to prevent her obtaining it.

Dr. T. B. Hislop described heroin as a most pernicious drug, which robbed its victim of all moral sense. Accused was sent for trial, bail being allowed.

BURBERRYS' WAR SERVICE.

In every business organisation is the root of adaptability, which fits men, implements, and materials to the national needs of the moment. To systematic organisation, perfected by long experience, Burberrys owe their present position as manufacturers of naval and military equipment.

Burberrys, as experts of long standing, are well qualified to give information and advice on all matters pertaining to naval and military outfits. The present Service Dress for Army Officers was designed by them at the request of the War Office, being adapted to military specifications from the Burberry Sports Suit, which, in the opinion of the authorities, completely embodied the ideal qualities with which they wished to invest the new field uniform. As the original designers of this model, with large experience of fitting out Officers of both Services for duty in every part of the world, Burberrys are naturally capable of materialising their own suggestions with great success.

For every branch of the Services Burberrys have designed some special garment or personal accessory, which makes duty easier, and directly contributes to the preservation of health.

Their intimate association with the most famous aviators and sportsmen, combined with their own practical knowledge of details, enables Burberrys to deal effectively with every new condition arising on land, or sea, or in the air, that requires the provision of some novel garment or accoutrement to counteract the effects of weather or climate.

Burberrys have just published two new catalogues—one for Military and the other for Naval kit—which will be sent post-free on application to their Haymarket house.

ON THE UNIFICATION OF THE FLYING SERVICES.

Under a new heading, but with the same hankering er ultimate perfection in the Flying Services, we y proceed this week to consider some further lessons the past three years of war.

Of course it is obvious that the ideal air force would nsist of a Unified Flying Service, embracing both e Royal Naval Air Service and the Royal Flying rps under one omniscient and omnipotent head. ch a force would be mounted on aeroplanes of about r types, a small fighter, a bigger fighter, a recon-ssance machine, and a very big bombing machine. these types would be standardised to the last ounce, h machine of a type would be exactly like its fellows, l woe betide the maker who dared to vary the thread a screw, or a shade of pigment in the paint on any of products. Every part of every engine would be olutely interchangeable with like parts on every er engine.

Every pilot would be equally standardised. Each uld weigh the same amount, so that every machine uld have a like performance. Every pilot's legs uld be the same length, so as to have a standard gth between seat and rudder bar. We should evolve ndards of audacity and of initiative, so that in action ry pilot would behave exactly like every other. d so forth.

Every pilot would be trained in exactly the same way, that every pilot would know exactly the standard ount about seaplanes and shore-going machines; flying r sea and over land; spotting for ships or spotting for llery; bombing submarines, bombing ammunition ips, bombing defended cities or bombing suburban dences; fighting aeroplanes or dodging Archies; ing photographs of trenches, shell-holes, battle s or lady friends. Thus we should produce per-ly standardised pilots, fitted to man a unified ing Service for operation on land or sea as might required,—that is if the poor little beggars' brains ld stand the strain without bursting. Anyhow, standarised and unified pilot is just as attainable ideal as is the unified and standardised Flying Ser-. And without the unified pilot I fail to see how unified Flying Service is going to do its work. lso the omniscient and omnipotent chief,—complete omniscient staff, as fitted,—is just as easily attain-as are all our other ideals. But let us consider our ng Service Ideals in the light of our three years' erience.

Specialisation versus Omniscience.

ow, one of the things which were for ever being mmed into us before the war was the doctrine of ialisation. We were bidden to take up one subject specialise therein, if we wished to become success-The ultimate evil of a man's career was that he ld be jack of all trades and master of none, so we told.

"Jack-of-all-trades" has been a term of reproach for centuries. Yet those who would have us unify our Flying Services have such faith in modern teaching that they would have us believe that we can produce aviators who are at once jacks and masters of all trades.

In the early days of the war, which were also the early days of flying, there was but little known about the science or practice of aviation. Under stress of war our knowledge increased rapidly, in spite of all hindrances, and as the aggregate amount of knowledge increased, so the difficulty of acquiring it all increased also.

In the early days one man might know all there was to know about piloting seaplanes or land machines, design, construction, and naval and military flying. As knowledge grew, the theory of design alone became, in many cases, more than one mind could contain. Construction alone also became enough to occupy a man's whole time. And naval and military flying expanded till either without the other demanded the whole attention of a really capable aviator.

It is true that one finds pilots who can fly the smallest and fastest fighter, or the biggest and heaviest bomb-dropper or seaplane with equal skill, but the mere art of flying is in itself the least part of a Service aviator's work. The more flying developed the greater became the need for specialisation, and the less possible became omniscience, even in this limited sphere of activities. Consequently we find already that aviators show more and more inclination to devote themselves to one branch of their particular Service.

Intensive Education.

For example, one finds pilots becoming specialists in air fighting, and, as a natural consequence, neglecting other sides of flying. Probably if one took a first-class fighting pilot and put him on to do ordinary reconnaissance he would fail lamentably, simply because in concentrating on all the tricks of the air fighter he had left himself no time in which to learn the science of soldiering, and so would know nothing about troop movements. Likewise he would probably fail completely as an artillery spotter.

Equally the first-class artillery spotter would fail as an air fighter, and all of them would fail as sea scouts if sent on a long patrol in a big flying-boat.

At the first meeting of the rejuvenated Aeronautical Society in January last, General Brancker in his admirable lecture on Training gave us a very good idea of the multiplicity of subjects which it was then necessary for the R.F.C. pupil to learn. Since that date still greater developments in air work at the front have taken place, and the amount to be learned has increased accordingly. Consequently there must be a stronger and stronger inclination to specialise as time goes on.

A Critical Point.

I make the suggestion with all humility, but I venture to ask those in charge of the training of aviators to consider very seriously whether we are not close to the critical point at which pupils are expected to learn too much. Pilots are needed in thousands, some for fighting machines, some for reconnaissance machines, and some for bomb-droppers,—those are practically the three specialised classes, the other phases of aerial activity come practically under one or other of those heads. Might it not be wise to give a pupil, or a cadet, on joining the option of choosing the class in which he would specialise?

It seems possible that a specialist in bomb-dropping, for example, would be better at his job, and would be more quickly trained, if he were left entirely ignorant of fighting tactics or of reconnaissance. Thus the total output of pilots might be increased, and the efficiency of each in his own line might also be increased. Complete knowledge of his own job might well make a man more valuable than a smattering of so many different subjects as he has to learn.

For example, the pilot of a big bomb-dropper has entirely wasted all the time which he has spent in learning about rotary engines, photography, troop-movements and reconnaissance generally, machine-guns, and so forth. That time might have been better spent in increasing his knowledge of ballistics, as applied to the fall of bombs, and in studying the behaviour of big engines, and the science of navigation.

Please do not think I am in any way criticising the system of Home Training, as hitherto carried on, for it has been marvellously efficient and at the same time effective. I merely wish to suggest that perhaps the time has come for still further specialisation, purely as a war measure.

So long as the training of young pilots remains in the hands of the officers who have been responsible for it during the past year or so, it is happily possible to look to the future with complete equanimity.

Possibilities of Error and Correction.

Naturally such specialisation as I have indicated might lead to some errors of judgment. For instance some youngster, full of ambitions towards M.Cs. and D.S.Os. and consecutive bars, might choose the air fighting course, and turn out to be utterly ham-fisted, and incapable of handling a fast fighter, yet he might have plenty of pluck and endurance, and be an ideal pilot of a big many-hundred-horse bomb-dropper. It should not be difficult to shunt him back to the next bombing class as soon as his failing was discovered, and he would only suffer to the extent of having his seniority in the Corps decreased by the time he had wasted in the wrong class.

At any rate it might be better than the kind of thing which occasionally happens to-day, where a pupil who shows that he has good hands is put on to fast fighters, whether he likes it or not, and discovers later that though he can fly anything, he cannot do the loops and corkscrews and "split-air" spirals and spins necessary in air fighting, simply because his inside will not stand it. The late Gustav Hamel, for all his trick flying, was frequently seized with air-sickness, and his best tricks were merely the elementary evolutions of every fighting pilot of to-day. I know of similar instances where sheer delicacy of their internal economy prevents otherwise excellent pilots from continuing as fighting pilots. Yet, apparently, instead of sending them back from the front for a refresher course of training in reconnaissance or bombing, it seems that such cases are liable to be turned over to become infantry officers, thus wasting all the time and labour spent in teaching them to fly.

To Save Waste.

I venture to suggest that unless a pilot has a black mark against his character, or unless he is proved incompetent, his flying knowledge should not be wasted. Also, I further suggest that no pilot should be turned down on the report of one senior officer, for it takes two to make a quarrel, and the man who cannot work without disturbance under one senior officer may work quietly and brilliantly under another.

Undoubtedly sheer incompatibility of temper has cost us quite a number of very good fliers, and there was more than a little sense in the suggestion made in the House of Commons recently that special squadrons should be formed of pilots who have been turned out of the R.F.C. because of rows with senior officers, and who do not want to give up flying. A strong but sympathetic senior officer might do a great deal with these "difficult" characters. The French have their way of handling them, and before the war the *Légion Etrangère* was full of them and their like.

It is rather a pity we do not pay more attention to matters of psychology. I can name off-hand three or four men who have been turned out without any really serious charge against them, and simply because they were a bit of a nuisance, yet I would guarantee to get valuable work out of any or all of them. They are quite good chaps at heart, though they would certainly be a nuisance to some people, especially the stodgy and solid sort, yet with proper handling they would be really useful.

The School of Experience.

However, I am getting rather wide of my purpose, which was to discuss the question of unification of the Flying Services. So far I have endeavoured to show how the tendency to specialise is increasing. It must be fairly obvious that the greater the specialisation the less is the possibility of producing aviators who could operate at will with either the Navy or Army.

The obvious reply of the ignorant is to point to the R.N.A.S. bombing squadrons in Flanders and the R.N.A.S. fighting squadrons, and to quote the high praise they have won from the Commander-in-Chief of the British Armies in France. The equally obvious answer, from anyone who knows, is that these gallant young gentlemen are not Naval aviators and are not Army aviators. They are simply highly efficient specialists in bomb-dropping and air fighting. They happen to have been taught to fly by the R.N.A.S., and they happen to be paid by the Admiralty, but what they know about bombing and fighting they have taught themselves.

The senior officers of those detachments have been so long in France that they have learned their jobs in the same school of experience as that in which the R.F.C. pilots have learned, and that experience has been handed back to R.N.A.S. schools at home, so that their newly joined subordinates are taught on their lines. But none of the work done by these detachments has anything particular to do with Naval aviation as such.

The "Giddy Harumphrodites."

They measure their speed in knots, which complicates comparison of their performances with those of the R.F.C. They talk about "going ashore" when they leave their aerodromes for a little relaxation in the nearest town. They call the car that takes them there the "leave-boat." They wear Naval rank-stripes, plus the new R.N.A.S. rank-stars, on a khaki uniform, which resembles that of a soldier. They measure time by "bells" and "watches," which also complicates co

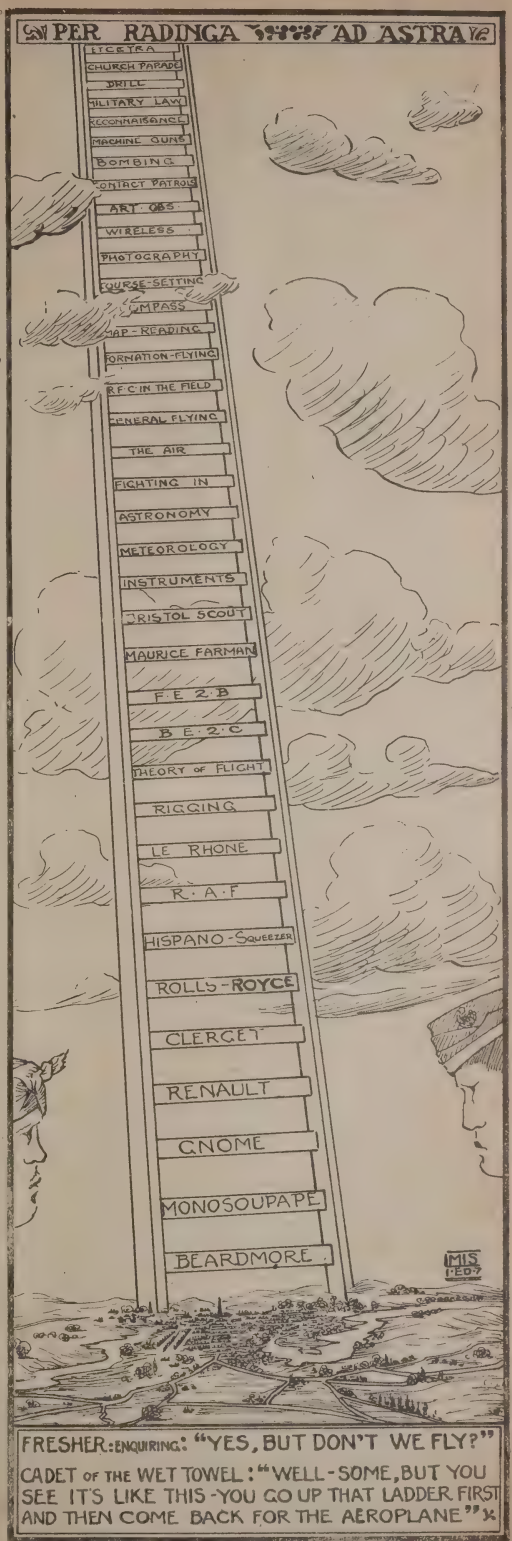
operation with the Army. But they are neither Naval nor Military aviators.

Comparisons are odious, but it seems possible that in their own jobs as bombers and air fighters they are perhaps a trifle superior to the average of the R.F.C., not because they are individually superior—they would be the first to resent any such claim—but just because they are specialists, and have not had to learn any part of the Navy's job or of the Army's job in addition to their own.

One cannot say that none of them has done any reconnaissance, because one knows something of their photographic work, but in this branch again the work is done by specialists, and the time in which this super-photography has been developed has been so short that any really brainy man who has specialised on it has got as far as any other. And, furthermore, aerial photography is not exclusively the job of the Navy or of the Army, but is common to both. Nevertheless, the information deduced from those same photographs would probably differ very considerably according to whether they were studied by a sailor or a soldier, or by an aviator who was neither.

Naval Aviation.

Having considered briefly the work of Military aviators and of R.N.A.S. aviators, whose work is strictly neither Naval nor Military, it may be well to point out what is really the work of a Naval aviator. At present, if one may judge by occasional brief paragraphs in the daily news-sheets, the R.N.A.S. proper is somewhat intimately concerned with the anti-submarine campaign which is being carried on with varying success by what one may call the *guerilla* branches of His Majesty's Navy.



It is fairly evident that such work distinctly calls for specialists. Doubtless bomb-dropping and machine-gun work comes into the operations, but both in ways very far removed from those practised by the R.N.A.S. bombers and air fighters in Flanders. Moreover, the seaplanes used in these operations differ materially from the machines used in Flanders, and call for specialist pilots.

Your first-class pilot of a big bomber would find himself very much at sea, in all senses, if called upon to bring a huge flying-boat, or a twin-float seaplane, smartly alongside a jetty, or to the end of a slipway, with a strong side wind blowing across a tide-rip. Your pilot of the small fast single-seat fighter would be equally puzzled to bring a "Schneider," or a "Baby," or an A.D. boat alongside a ship, preparatory to being hauled inboard by a derrick. Both would have to learn something of seamanship, as well as learning airmanship of a kind entirely different from that to which the over-land pilot is accustomed.

Furthermore, this 'long-shore submarine-chasing phase of flying is closely allied to the work which will have to be done by pilots operating on the High Seas in such time when the Fleet takes the Royal Naval Air Service to its bosom and regards it as an integral part of the British Navy, as it will do some day. Only probably by that time we shall have only submersible battleships, and our seaplane motherships may then launch their air scouts by the simple process of sitting them on deck and leaving them afloat when the ship submerges.

A Childish Fancy.

There was a time—some four and a half years ago—when I strongly advocated in print launching aeroplanes by catapult from the fore-decks of ships. The fuselages of the machines were to be unsinkable, and they were to be hauled aboard any old how when they

The R.F.C. Cadet's Progress at Reading.

flopped into the water alongside on their return. In the light of later knowledge, and of the development of submarines, this process now seems insufferably crude and out of date. I can only plead that progress has been rapid since I held those elementary views, and that the process would have had some practical use if it had been put into operation just about when war broke out—as it might well have been. To-day, of course, it would merely seem childish to anyone with any considerable knowledge of modern possibilities.

The Real Naval Air Service.

In those days to come the real Naval Air Service will be as far remote from over-land flying as the Navy to-day is from the Army. The Naval aviator will be merely an officer of the Navy who flies, and will be a specialist of the Navy in the same way that the gunnery jack, and the torpedo lieutenant, and the navigator is a specialist, as distinct from the watch-keeper. The simple act of flying will be only a part of his job as a sailor.

Possibly I am lacking in imagination, possibly I am growing old and conservative in my notions, but I fail utterly to see how the real Naval aviator can possibly be a member of that unified Imperial Air Service which so many well-meaning people wish to bring into existence.

The Artillery Aviator.

In a somewhat analogous way there seems good reason to argue that the Army aviator of the future must be wholly a soldier if he is to be efficient at his job. In my ignorance of military detail I may be wrong, but it appears to me unlikely that a forward observation officer, or F.O.O., as he is generally called in these alphabetical days, is other than an officer of the Royal Regiment of Artillery.

There is, it is true, a story of a sporting infantry private who was borrowed by a gunner F.O.O. to act as telephonist, owing to his own man being knocked out. The battery was endeavouring to bring down a house which was stiff with machine-guns, and the infantryman was so interested in the job that he kept on popping up his head to watch the result of each shot, instead of merely waiting for the F.O.O.'s corrections. Finally, a shell plunged straight into the house, whereupon the telephonist, in his excitement, yelled into the transmitter, "Right through the bally window! Will you have a cigar or nuts?"

One gathers that though the battery commander was pleased with the result, he did not approve of the method of conveying the information. The moral seems to be that the specialist's job should be done by a specialist.

It seems, therefore, rather as if the artillery observation aeroplane should be simply a vehicle conveying a gunner officer, instead of a machine and crew belonging to another Corps, lent for the occasion. Without in any way detracting from the magnificent work done by the art. ob. machines of the R.F.C., perhaps one may submit the suggestion that still higher efficiency—if it be possible—might be reached if each artillery brigade had its own art. ob. squadron, as an integral part of the brigade, just as it has its own ammunition column and transport.

Probably, art. ob. squadrons R.A. would be smaller than the regular R.F.C. squadrons, but every man would be a specialist. Doubtless, the *personnel* would be taught to fly by the R.F.C., but, thereafter, they would be officers and men of the Royal Regiment of Artillery, unless the R.A. set up flying schools of their own, as they have their own riding-schools apart from the Cavalry. The arrangement would make for *esprit de corps*, and would certainly maintain the highest level of efficiency.

The Work of the R.F.C.

Similarly the work of the R.F.C. proper would continue to be wholly military. Reconnaissance is pre-eminently work for a highly trained soldier, and not for an air-fighter or bomb-dropper. The corps squadrons of the R.F.C., to be efficient must be highly trained in military science. A successful military photographer should know what to photograph, and not merely how to photograph it. If not, it would be just as well to send a member of the staff of one of the cheap illustrated news-sheets with which we are afflicted as to send a military aviator to do the work.

Military Bombing.

Also, for bomb-dropping within what the French call the zone of the armies, as distinct from bomb-dropping raids in the enemy's country, real military knowledge is essential if bombs are not to be wasted on useless objectives. Even to-day bombing is not taken as seriously as it deserves to be, and until comparatively recently it was the most amateurish branch of our military operations, chiefly, I believe, because so few professional soldiers had time to spare for the study of the subject.

Any machine capable of lifting a hundred pounds or so of extra weight was a good enough thing to which to attach a few bombs, which bombs were generally placed so as to retard the machine's progress considerably. The French first paid serious attention to bombing machines, but the Germans were the first to develop the big bomber as a specialist's type, and to make important use of it.

It is still hard to induce the young and ardent pilot, whose idea of an aeroplane is the biggest possible engine with the smallest possible fringe of aeroplane round it (acknowledgments to F. S. B., who coined the phrase), that the aerial "tank" has its uses. He feels acutely miserable on a vast platform which cannot dodge, and he forgets that it can defend itself.

Very few R.F.C. pilots, and probably not many senior officers of the R.F.C., have seen big bombers in action, but those who have seen them are full of respect for them. And those who have fought them hold them in still greater esteem. The mere London mob, as a matter of fact, probably knows more about the virtues of big bombers than do the active-service pilots who condemn them so freely. Possibly, however, the limited output of real bombing machines, owing to the greater need for other types by corps squadrons, is largely accountable for the prevailing ignorance of their capabilities. Therefore we are the more indebted to the Germans for the education they have provided.

As to the army squadrons of the R.F.C., as distinct from corps squadrons, they alone of the R.F.C. personnel need but little real military knowledge, being concerned with fighting rather than with any directly military operations on the ground.

Is Unification Possible?

From this somewhat lengthy, and yet extremely superficial, review of the duties of active-service aviators one sees that either Naval or Military knowledge is of greater importance than mere knowledge of flying. If one had time and space in which to go more deeply into the subject, and if the necessity of withholding information from the enemy did not prevent discussion in detail, one would doubtless find good proof that the more the work of the two Services is studied and developed, the greater must be the divergence between Naval and Military aviation, not only in the training of the personnel, but in the actual design of the machines.

Leaving the question of machines aside for a further discussion, and considering personnel only, I fail entirely to see how any unification of the two existing Flying Services is possible. If anyone can give me any argument in favour of a single Air Service, I shall be extremely grateful, for I should like to agree with sundry valued friends of mine who are ardent advocates of a single service.

The argument that water is one element with one service, and land is another with another service, and that the air is a third, and therefore must have a separate service, is only partly valid. One might equally well argue that no sailor should ever fight on land—generally it is as well that he should not—and that no soldier should ever run a boat—though, in fact, the War Department run their boats excellently. The fact is that air is the common property of all, therefore aerial vehicles may convey either sailors or soldiers upon their lawful occasions.

There is as good reason for arguing that the Royal Regiment of Artillery should man and operate the guns of the Fleet—not but that they would make a first-class job of it—as for arguing that the Imperial Air Service should do all the air work for Navy and Army alike. Even supposing that the Royal Artillery made better shooting than do the gun-layers of the Navy, does anybody who knows the Navy imagine that such an arrangement could possibly work? How, then, can an Air Service which is neither Navy nor Army work with both?

It is admitted, even by the advocates of a Unified Air Service, that after the elementary stages of flying are passed the young aviator would have to devote himself entirely to either the Naval or Military Wing. What, then, is the advantage over making him outright an officer of one Service or the other? The disadvantages of making an Air Service officer in, but not of, either of the other Services seem too obvious to need argument. Consider the status of a Marine on board ship for a simple example.

The Imperial Air Service.

There are, however, sound arguments in favour of an Imperial Air Service, entirely separate from the Navy and Army, and operating in conjunction with either, just as the two Services co-operate when required to-day. We have the embryo of such an Air Service before us in the non-Naval squadrons of the R.N.A.S. to-day. And we have had examples of the possibilities of such a Service in the German air raids on England.

As I have already demonstrated, the R.N.A.S. squadrons in Flanders have been doing Air Service work pure and simple. The bombing squadrons have materially deteriorated the German raiding squadrons detailed for attack on England. In this respect they have assisted our Home Defence Forces. They have also bombed German Naval points on the Belgian coast, and so have assisted the Navy. They have carried out other bombing work to assist the Army in Flanders.

In the Balkans R.N.A.S. bombing detachments have assisted the French, British, and Servian Armies. And they have bombed Constantinople, which was neither Navy nor Army work, but pure Air Service work, which, if carried on sufficiently, would help materially to get along with the war.

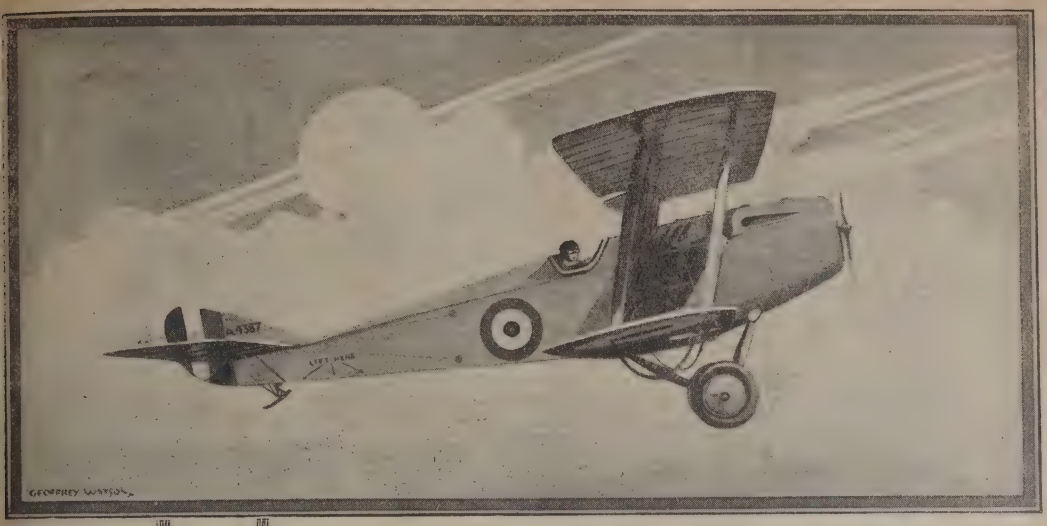
Similarly, the fighting squadrons of the R.N.A.S. in Flanders have attacked and brought down raiders bound for or from England, as well as Dunkirk, Calais, Boulogne, and elsewhere. Thus they acted as air guards for England, and for Naval and Military points in France as well. Others have acted as army squadrons for our troops in France, as well as providing air fighters in the Balkans and elsewhere.

In none of these activities have they been either purely Naval or purely Military units, and for none of this work did the personnel require any Naval or Military knowledge. They did absolute Air Service work as specialists, and in that particular phase of war their knowledge is as great as that of any people living.

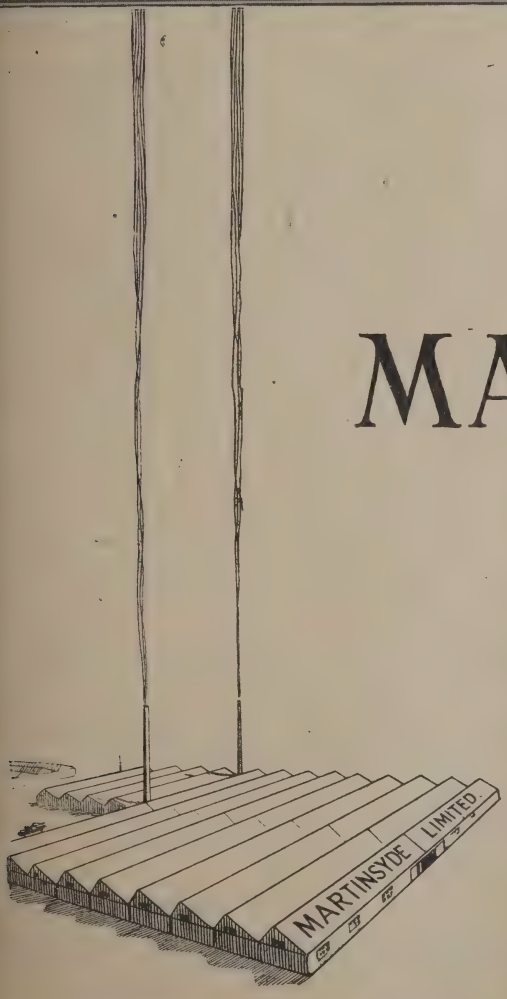
Future Development.

Here, then, is the line along which the present advocates of unification had better expend their energies, for in this direction lies the future development of the Imperial Air Service. The nucleus of senior officers must of necessity be sailors and soldiers, but the rest of the personnel should be neither. There are plenty of experienced warrant and non-commissioned officers and men—as experience goes in these days—who are at present nominally in the Navy or Army, but who are really heart and soul Air Service. A certain number of them would willingly be transferred to the new Service, and the bulk could be made up from youngsters just reaching military age, and from the Colonies.

It may be assumed at once that both the Navy and Army want more men than they can get. The Army would gleefully enlist the whole personnel of the Fleet if given the chance, and the Navy would equally gladly turn the whole Army into sailors if it could prevail upon the War Cabinet to stop wasting money on shells and guns and things for the Army and put that money into ships on which the new Navy could be embarked. Each Service very naturally and rightly regards itself as the one and only indispensible.



Just so the Air Service advocates think that the war will be won in the air. It is well that they should think so, for it gives energy to their efforts. The fact that the war cannot be won without a flat-footed Army of Occupation in enemy territory, and that the said Army cannot be transported and fed overseas without a Fleet, may escape their notice, and may make them look a trifle ridiculous in the eyes of the less enthusiastically or more logically minded, but one would not for worlds damp their enthusiasm.



Enthusiasm Over-run.

The other evening I heard one of our latter-day prophets, who has long prophesied vaguely the coming of Aerial Supremacy, and who is a prophet with considerable profit in this his own country, telling a distinguished gathering how in France he passed through mile upon mile of horse camps. Being merely an inspired ass, and not even temperamentally a soldier, he boldly advocated that all the money, and labour, and transport involved in obtaining and maintaining these horses should be turned onto increasing the Air Service.

He quite omitted to say how A.S.C. horse transport is to be worked, or how mounted infantry is to operate if open warfare eventuates, or how our armies of pursuit are to get along when the great opportunity for the *arme blanche* occurs, as it will some day. Nor did he explain how infantry majors, and padres, and such persons of importance, are to be conveyed with due dignity—if without comfort.

He talked glibly of Third Dimension Cavalry—my old jest of two years ago—and imagined that because aeroplanes can go where the woolly horse cannot go, therefore aeroplanes can replace the woolly horse everywhere. As a matter of fact, despite all our motors, and caterpillar tractors, and tanks, and aeroplanes, there are many occasions on which our well-tried four-legged friends can and will beat the lot, so do not let us permit our enthusiasm to over-run itself.

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS

An Immediate Decision Needed.

There is a definite need for an Imperial Air Service, and it is for the War Cabinet, or whoever really rules the Nation, to decide the priority of that Service. Eventually it will be far bigger than the Navy, because it will be more essential to the Empire's safety. But it will be smaller than the Army, because the man with a rifle in his hand is the person who ultimately wins a war and keeps it won. At present the problem is to decide which Service shall have the prior claim on men, material, machinery, and labour.

Obviously the Army has first claim. The Navy is strong enough for the purposes of this war, so far as the present obsolescent surface-ships are concerned, but obviously the Submarine Service deserves to be de veloped to its utmost. The Air Service should ultimatel be bigger than the R.F.C., but until the Army is reason ably well equipped with aircraft nothing much can b done for the Imperial Air Service.

Nevertheless, now is the time, while the Public, an therefore the politicians, are interested in aircraft, t form the beginnings of the new Air Service. If a reason able allocation of material and personnel be decreed fo that Service, and if a capable man be put in command it should be possible in not less than six months, an not more than twelve, to stop all air-raiding into Eng land, and to carry the air war into the enemy's countr with such results as materially to affect the issue of th war as a whole.—C. G. G.

An Episode of Life.

On occasion it is good that people should see themselves as others see them. None can accuse this paper of having unduly advertised the heroism of flying officers, for it has been felt that constant glorification is apt to turn the heads of the young, and so one has said much less than one has felt of admiration for those on active service. Therefore one may perhaps be forgiven for presenting to our active-service pilots a little story showing them how they are regarded by those at home whom they have the honour to defend:

Marguerite Patricia Harrison was a typical English girl of that healthy country-bred type which is one of the finest possessions of this nation. Like so many of her sex, she took the keenest possible interest in flying, even before the war, and, living as she did on the route between two important aerodromes, she saw much of machines and pilots. When war came, she was only twelve or thirteen years of age, but she followed the work of the Flying Services with the closest attention, and her admiration for the men who flew so gallantly was boundless.

Some few weeks ago it became necessary for her to undergo a minor operation, ordinarily of no consequence. She had no fear of the operation herself, and proceeded to take the anæsthetic cheerfully and confidently. From that sleep she never awoke.

When her parents came to look through her little belongings they found that the day before the operation—as if she had a premonition of her fate—she had written a farewell letter, disposing of her property among her friends. In this letter was a short note addressed to the officers of the Flying Services, which she so much admired, and a request that, if possible, it should be conveyed to those for whom it was intended. One has therefore the privilege of doing so The note reads thus:

"To all the officers of the R.F.C. and R.N.A.S.—I wish to thank all of you brave and gallant officers o the R.F.C. and R.N.A.S. for the great work you, eac one of you, are doing, giving your dear brave lives t King and Country.

"I have a wonderful admiration for the R.F.C. an the great work it is doing, and also for the R.N.A.S The young aviator, always ready for work, up at hal past two at the front, just comes down for mess, and if the 'bus is damaged, hops into another and off ove the enemies' lines again.

"Once more I thank you for the great work you ar doing, and I wish very, very good luck to you all.—(Signed) Marguerite Patricia Harrison.

There you have in simple girlish language the heart felt thoughts of many a little maid whose gentle hom life is being preserved to her by our troops on activ service. We cynical newspaper people have an axiom to the effect that for one person who writes a lette there are a thousand who would like to do so if the could take the trouble to collect the writing material In such an extraordinary case as this, one may safel say that millions think as poor little Marguerite Patrici thought, and one hopes that the knowledge may hel those youngsters, many of them little more tha children themselves for all their brave affectation o disillusioned manhood, who are working and sufferin on active service.

One reads much of brutal labour discontent, of heart less financial profiteering, of cynical political graft, s it is good at times to realise that there is still purity and innocence in the country for which one is fighting.—C. G. G.

AIRCRAFT DAMAGE TO CROPS.

At a meeting of the Wiltshire War Agricultural Committee at Trowbridge, Mr. Gordon Redman, of Collingbourne, drew attention to the grave risk of farmers in regard to their crops in the neighbourhood of aerodromes through damage by aircraft. He did not think farmers understood the position. The War Department accepted no liability for direct or indirect damage by aircraft, which, in a county like Wiltshire, was a serious matter. One farmer in twenty did not know that, if aircraft dropped in a field of wheat and burned up twenty acres, he could get no redress whatever. He admitted that there was a scheme of insurance, but it was extraordinary that, while the War Office acknowledged responsibility for damage done by troops or artillery, no such liability was admited in regard to aircraft.

Mr. E. G. Warren, farmer, South Wilts, said that an aircraft dropped in one of his fields, and while it did no damage, the officer in charge said he was in a position to negotiate with the owner if damage had been done.

Mr. Redman said he had had several down in his fields, but the damage having been but little, he had made no claim. There was no doubt, however, that an order had been issued to the effect that no such claims for damage were allowable.

An instance was given where aircraft had dropped in a fiel of wheat in the county, and half-an-acre of the crop had t be cut to make room for it to be got out. In that case, th officer authorised the owner to send in a claim for £10. Tha so far had not been paid, but payment was not refused.

Mr. Redman quoted a case in which a claim for £4 wa sent in last November, and up to now it had been refused.

Mr. Arthur Stratton (President of the Local Branch of th National Farmers' Union) pointed out that more damage t crops was done by the people who flocked to see aircraft o the ground than by the aircraft itself—a fact which was confirme by another farmer who had suffered in that way. It was de cided to make inquiries as to the legal position in regard t compensation.

WAR WORK.

An opportunity is afforded by the Middlesex Education Com mittee at the Willesden Polytechnic, Kilburn, to capable wome between the ages of 18 and 35 to receive a month's training i woodwork for aeroplane factories. During this period they ar paid 15s. a week, and afterwards they are drafted into factories where they receive a minimum wage of about 25s. to 30s. pe week to commence with.

OFFICIAL DESIGN.

BY "BERKELEY."

Throughout history there has been a constant and ever vivid rivalry between private and public enterprise. The rulers and the ruled, often in complete concord when the affairs of other States hold their attention, are rarely joined in entire amity over the internal economy of their own country. The people of France lived in the warm splendour of the military genius of Louis XIV and acknowledged the reflected glory. It was their blood and their money that made the tools of victory, but it was his mind and his inspiration which directed the tools in their perfect work.

Nevertheless, the people did not so readily admit his inspiration when local drainage schemes held his attention. It is one thing to die in gracious heroism in a far country for the honour of France—it is quite another thing to live throughout the prime of mortal life in all the glowing richness of an undying smell.

The Official Ark.

Noah, who "was a just man and perfect in his generation," designed by the aid of divine inspiration an ark of vast dimensions, that in the day of trouble he might live in security on the face of the waters. He was no member of the official caste, and it can be assumed that he received no official support in the perfecting of the design of his ark.

Officialdom probably wrangled over the factor of safety proper to a government ark. Hence, when the floods rose in their majesty, officialdom and its followers drowned in a misery only relieved by the thought that, though death had come to them, their theories of ark construction had been put to no disproof.

Official Inquisitors.

And so through the later ages. Intellectual Spaniards, unwise in their generation, who with misguided brilliance invented things of note without the official seal of approbation, ended their lives in ecstasies of flaming bliss under the fell sentences of the familiars of the Great Inquisition. In England the people did not burn their inventors—they merely laughed in pleasant derision, a more certain ending than all the torture devised by the twisted thoughts of humankind.

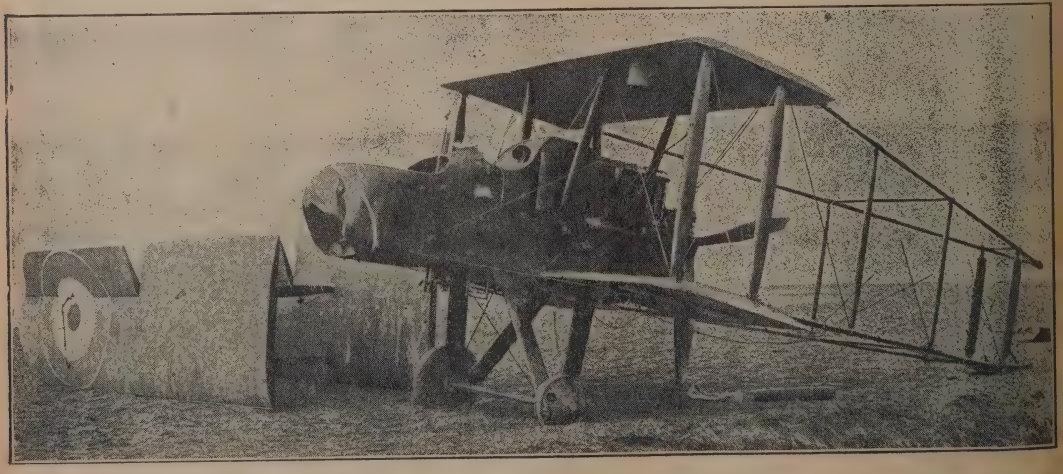
It has always been a long and dreary battle before the skill of a man has been permitted to bring vigour and freshness of thought to a proper stage of success. Novelty is pleasant in amusement, but it is unforgivable in the serious walks of existence.

Official Justification.

Nevertheless, the paths of officialdom are proper to be trod by those who desire ultimate and continuing success, if the manner of tool to be designed and produced intimately concerns the art of war.

In all warlike things secrecy is an essential element of success. To whisper abroad the mysteries of the mental skill of the nation's war-wizards is to court that measure of defeat in the field which may be splendid to remote posterity, but is grimly disastrous to the immediate present. Had Germany in all sincerity told us of her designs in the use of artillery before the sunshine of August, 1914, the early days of this present war might have been different. But she is not skilled in that manner of unwisdom. Silence is a splendid virtue banished from England by the Stock Exchange and the Palace of Westminster.

The Official Mind.



Each great step in an industry concerning war has been trodden by the unofficial dreams of genius, but each step has been consolidated by the perseverance of the slow official mind.

Steam power was thought out in no Government office. The screw succeeded the paddle in the propulsion of steamships through no activity of the official brain. The turrets which to-day are an integral part of all large ships of war were designed by a simple captain in His Majesty's Navy. The submarine itself probably came into being from the disordered dream of a dyspeptic American.

But each of these inventions attained perfection not in the hands of civilian designers but from those who were employed as public servants.

Official Custom.

To-day it is not customary, when it is desired to increase the fleet by a number of battleships, to put out the designs to public tender. The main features of the design are drawn out in the allotted Government office, and are finally amplified in the drawing office

IN THE HANDS OF THE ENEMY.—An Officially Designed F.E. Biplane, photographed as taken apart for transport, after being captured by the Germans. The front of the nacelle suggests that the machine stood on its nose in landing.

of the firms which have been selected to fulfil the contract. The very firms which are employed in the construction of munitions of war (in times of peace) are themselves, by reason of the work, in a sense official.

Official Aeronautics.

In aeronautics the same rules will apply as time passes by. To-day and in the past the whole science is in its infancy, and the great question at issue is the production of any aeroplanes that will fly. For the time being military and commercial interests are the same, in so far as aircraft are concerned. Neither the distinctive military aeroplane nor that proper for commercial use has as yet been either designed or constructed.

All aeroplanes of the present day possess attributes which make them of equal use in peace or war. If in the course of the next few months the war should end, any aeroplane now employed on military duties would, by the removal of such decorations as give it its likeness to a Christmas-tree, become a machine in which pleasure flying could be carried out both with happiness and success.

Official Requirements.

As time passes, all this beautiful simplicity of design will end, and attributes of more strict application to the work in hand will be required. An aeroplane will no longer be inherently suited for war merely because it flies swiftly or climbs with astounding celerity. For warlike purposes it will of necessity possess points of design which will peculiarly fit it for the work in hand.

A reconnoitring aeroplane will differ in essential detail from machines designed for aerial fighting. Those aeroplanes which are intended to drop bombs in enthusiastic and accurate profusion over all parts of the enemy terrain will be of high value for that purpose and for that purpose only.

Official Specialisation.

None would think of asking a battery of artillery to act temporarily as a battalion of infantry, nor will any future general gifted with rudimentary sanity employ his fighting aeroplanes as spotters for his guns.

[One regrets that exigencies of modern war under improper official preparation have resulted in cavalry being used as infantry, aeroplanes as cavalry, infantry as sappers, and "tanks" as cook-shops and canteens, but these unavoidable departures from their specialised purposes are the exceptions which prove the rule, as laid down by "Berkeley."—Ed.]

Each aeroplane will have its place, and will be designed and built to fill that place with efficiency.

Until this stage of efficiency has been reached, the development of aircraft will remain in the hands of the private designers, assisted by the accumulated experience of the active-service pilots and by the conservatism of official brains. The eccentricities of the Royal Aircraft Factory may in the memory add to the gaiety of communal afternoons in the country, but there is little doubt its designers have assisted greatly in the development of aeroplanes, sometimes by mental brilliancy and often by charming and interesting mistakes.

Official Control.

In the future the paths of peace and war in the design and production of flying machines will divide. The civilian designers and the commercial aircraft companies will supply such aeroplanes as may be desired in sport and commerce, but an official designing office and a body of selected contractors will control the production and development of the aeroplane of war. This latter type will by then differ as greatly from commercial aircraft as does a cargo vessel from a T.B.D.

The armour, the gunnery arrangements, and the bomb-dropping devices will each be as secret, or as little secret, as are the internal parts of a present-day warship. It will not be for the common herd to talk with light and inaccurate knowledge of the secrets of the air battleship of the day to come.

Official Technicalities.

The mass of technicality peculiar to this class of work will grow rapidly, until everything concerning the production of warlike aircraft will be as highly specialised and as exclusive in outlook as a German guild in the Middle Ages. A separate branch of it may, perhaps, be called the profession of aerial architecture.

The section of the Air Services set aside for this work may, perhaps, draw its personnel from the drawing offices of the great aircraft companies, but it will, in addition, assuredly train a very large proportion of its staff from adolescence to storied age.

Official Evolution.

Each type of craft, having its own peculiar features of design, must be designed by those whose experience best qualifies them for the work. Progress in such matters depends much more on natural development than on the individual efforts of heaven-sent genius.

Each machine as it is put into use is found wanting in some manner. In the next design the modification or development suggested by experience should be included. And so the process of evolution passes on.

The Official Future.

Such points of value as may be produced by the companies producing aircraft are not to be ignored. Great changes in system are invariably the result of natural genius, and natural genius does not always rest in the gloom of a government office. The use of iron and of steel in ships of war followed the practice common among commercial craft. The turbine was invented by a civilian distantly connected with naval construction.

If these arguments have anything in their favour, it should be clear that in the future the development of military aeronautics, in so far as design is concerned, will lie in the hands of a government office, assisted by the great contracting firms.

THE LATEST RAID RESULTS.

The Press Bureau issued the following communiqué on August 13th at 8.20:—

The reports of the pilots show conclusively that the enemy aircraft formation which attacked the East Coast was making for London. On sighting the large number of our aeroplanes which were sent up against them, they turned abruptly and made the best of their way out to sea again, dropping some bombs at Southend and unloading the rest when out at sea. The action of the anti-aircraft guns was of great assistance to our fighting squadrons.

The casualties at Southend have been finally established to be as follows, states an official report:—

Killed: 10 men, 13 women, 9 children—total 32.

Injured: 13 men, 18 women, 12 children—total 43.

[It is distinctly a pity that the first announcement of the raid did not note the fact that the German raiders were driven off by the strong formations of defensive aeroplanes which met them on their way to London, as the Home Defence Forces would then have received due credit for their excellent work. Instead of this there was a tendency to jeer at a defence system which allowed the enemy to escape without loss. The machine brought down was not sunk by the R.F.C. Home Defence Wing, and therefore that excellently organised force was deprived of the credit which is its due.

One is doubtful whether one ought not to decry our Home Defence arrangements in the hope of luring the Hun to destruction, but a regard for accuracy, greater perhaps than that suggested in some official communications, compels one to say that aeroplane and gun defences and observation system are all alike of high excellence, and, if towns on the East Coast are occasionally discommoded, that is but the penalty of fame, owing to their being in the war area. Their discomfort will doubtless cease when serious retaliatory raids on Germany begin.—C. G. G.]

AIRCRAFT SUPPLIES

For Illustrated Stock and Quotation List see

"Aircraft Supplies"

Our Fortnightly House Journal

Published fortnightly, on alternate Thursday evenings, and issued FREE to the Air Services and to the Aircraft Industry (those in charge of Stores and other Works or Service Departments ONLY), on application to the Secretary.

Contains a complete LIST OF STOCK of Aircraft Parts up to the time of going to press, CURRENT PRICES, details of NEW ITEMS, ENQUIRY BUREAU, and other A.S.C. Announcements. A SHORT ARTICLE will also appear in each issue on a topic of interest to Aircraft Constructors.

Stock List contains over 400 items.

Send us a COMPLETE LIST of your requirements, and we will return this to you in course of post with the prices marked against those items we can supply FROM STOCK, or deliver quickly.

A.G.S. and STANDARD PARTS from STOCK.

SPECIAL AIRCRAFT and ENGINE PARTS for EARLY DELIVERY.

"The A.G.S. Book"

By BERNARD ISAAC.
130 Pages. Over 230 Illustrations.

AN IMPORTANT WORK of REFERENCE FOR THE AIRCRAFT INDUSTRY AND THE AIR SERVICES

CONTENTS.

Charts of A.G.S. Rafwires, Tie Rods and Joints, Nuts, Bolts, etc., covering extracts from 82 blue prints—Metric Equivalent Charts—Numerical List of A.G.S. Parts—Alphabetical List of A.G.S. Parts—A.G.S. and other Screw Thread Systems—A.G.S. Standard for Bolt Heads and Nuts—Photographs, Drawings and Dimensions of all important A.G.S. Parts—A.G.S. Fits and Limits—Test Pieces—Articles on "Standardization of Aircraft Parts" and "Accelerating Aircraft Output"—Chart of Admiralty Strainers—Illustrations of R.A.F. and other Aircraft Parts, etc., etc., etc.

The "A.G.S. BOOK" is issued to approved applications from the Air Services and the Aircraft Industry. Persons connected with the Aircraft Industry should make application through their firms. Applications from the Air Services should be made through the Commanding Officer. One copy is supplied free, to each firm and additional copies may be obtained at 2s. 6d. each, the whole of the proceeds, without deduction, being given to the Royal Aero Club Flying Services Fund.

Applications must be made on the special forms which may be had from the Secretary, The Aircraft Supplies Co., Ltd., West End Offices, 166, Piccadilly, London, W.1.

The King has been pleased to approve of the following Rewards for distinguished service in the Field, dated June 3rd.

Awarded a Bar to the D.S.O.

Maj. Arthur Justin Ross, D.S.O., R.E. and R.F.C.

Awarded the Military Cross.

Lt. Ernest Ayscoghe Floyer, Ind. Army R. of O. and R.F.C.
Lt. Thomas Henderson, R.E. and R.F.C.
Capt. Thomas Westropp Mulcahy-Morgan, R. Ir. Fus. and R.F.C.
Sec. Lt. William George Stafford, Gen. List and R.F.C.
Sec. Lt. (temp. Lt.) David Norrie Thomson, Yeo. and R.F.C.

War Office, August 9th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing. —Adjt.—Temp. Lt. R. H. Peto, Gen. List, and to be temp. Capt. (without the pay and allowances of that rank) whilst empld. as Adjt., May 15th.

War Office, August 10th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing. —Group Instr. in Gunnery.—Graded as a Flt. Comdr.—Sec. Lt. (temp. Capt.) A. P. Davidson, High. L.I., from an Instr. in Gunnery (graded as Equipment Officer, 1st Cl.), and to retain his temp. rank whilst so empld., vice Lt. (temp. Capt.) M. R. N. Jennings, Spec. Res., who reverts to Flying Officer (seny. May 20th, 1916), and relinquishes his temp. rank, July 28th.

Instr. in Gunnery.—Graded as an Equipment Officer, 1st Cl.—Lt. E. Parker, E. Lan. R., Spec. Res., from an Asst. Instr. in Gunnery (graded as an Equipment Officer, 3rd Cl.), and to be temp. Capt. whilst so empld., vice Sec. Lt. (temp. Capt.) R. C. Hardie, D. of Corn. L.I., Spec. Res., who reverts to Flying Officer (seny. Jan. 28th), and the rank of temp. Lt., July 27th.

Balloon Co. Comdrs.—Graded as Sqdn. Comdr.—Temp. Capt. H. D. Jensen, M.C., Gen. List, from a Balloon Co. Comdr. (graded as a Flt. Comdr.), and to be temp. Maj. whilst so empld., July 18th. Graded as a Flt. Comdr.—Lt. (temp. Maj.) E. B. Broughton, Spec. Res., reverts from a Balloon Co. Comdr. (graded as a Sqdn. Comdr.) at his own request to relinquish his temp. rank and to be temp. Capt. whilst so empld., July 23rd, seny. July 5th, 1916.

Special Appt.—Graded as an Equipment Officer, 1st Cl.—Temp. Lt. R. de Sarigny, Gen. List, from the 2nd Cl., and to be temp. Capt. whilst so empld., June 9th.

Equip. Officers, 1st Cl.—From the 2nd Cl., and to be temp. Capts. whilst so empld. :—Temp. Lt. A. W. Empson, Gen. List, June 9th. Temp. Lt. L. G. T. Sedgwick, Gen. List; Sec. Lt. (temp. Lt.) A. B. D. Lang, Spec. Res., July 6th.

War Office, August 11th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing. —Staff Officers, 2nd Cl.—Graded as a Brig.-Maj.—Lt. (temp. Capt.) W. A. A. Chauncy, York R., from an Adjt., R.F.C., June 22nd.

3rd Cl.—Graded as Staff Capts.—Temp. Capt. F. W. Prendergast, Leins. R.; Capt. R. D. Law, W. York R., T.F., and to be secd.; Temp. Capt. J. Hamilton, attd. E. Kent R., and to be transfd. to R.F.C., Gen. List, June 22nd.

Sqdn. Comdrs.—From Flt. Comdrs., and to be temp. Majs. whilst so empld.—Temp. Capt. F. J. Powell, M.C., Gen. List, May 16th. Lt. (temp. Capt.) C. M. B. Chapman, M.C., E. Kent R., July 20th.

Special Appts.—Graded as a Sqdn. Comdr.—Capt. (temp. Maj.) T. G. Hetherington, Hrs., from a Sqdn. Comdr., and to retain his temp. rank whilst so empld., June 22nd. Graded as Flt. Comdrs.—From Flt. Comdrs., July 15th :—Temp. Capt. W. E. G. Murray, Gen. List; Temp. Capt. S. S. Halse, Gen. List; Sec. Lt. (temp. Capt.) S. N. Cole, Spec. Res., and to retain his temp. rank whilst so empld.

Special Appts.—Graded as Park Comdrs., and to be temp. Majs. whilst so empld. :—Lt. (temp. Capt.) A. E. Snape, Spec. Res., from an Equipment Officer, 1st Cl.; Lt. A. E. Oxley, Spec. Res., from an Equipment Officer, 3rd Cl., June 22nd.

Equipment Officer, 1st Cl.—Lt. R. A. Courtney, Spec. Res., from the 2nd Cl., and to be temp. Capt. while so empld., June 22nd.

Special Appts. (graded as Equipment Officers, 1st Cl.). From Equipment Officers, 2nd Cl., and to be temp. Capts. while so empld. :—Lt. V. F. P. Bryce, Spec. Res.; Lt. P. P. Eckersley, Spec. Res., June 22nd.

* * *

The King has been pleased to approve of the award of the Victoria Cross to the following Officer :—

Capt. William Avery Bishop, D.S.O., M.C., Canadian Cavalry and R.F.C.

For most conspicuous bravery, determination, and skill.

Capt. Bishop, who had been sent out to work independently, flew first of all to an enemy aerodrome; finding no machine about, he flew on to another aerodrome about three miles south-east, which was at least 12 miles the other side of the line. Seven machines, some with their engines running, were on the ground. He attacked these from about 50 ft., and a mechanic, who was starting one of the engines, was seen to fall. One of the machines got off the ground, but at a height of 60 ft. Capt. Bishop fired 15 rounds into it at very close range, and it crashed to the ground.

THE BRITISH & COLONIAL AEROPLANE CO., LIMITED

(Private Branch Exchange)

A second machine got off the ground, into which he fired 30 rounds at 150 yards range, and it fell into a tree.

Two more machines then rose from the aerodrome. One of these he engaged at the height of 1,000 ft., emptying the rest of his drum of ammunition. This machine crashed 300 yards from the aerodrome, after which Capt. Bishop emptied a whole drum into the fourth hostile machine, and then flew back to his station.

Four hostile scouts were about 1,000 ft. above him for about a mile of his return journey, but they would not attack.

His machine was very badly shot about by machine-gun fire from the ground.

* * *

The King has been pleased to award the Distinguished Service Medal to the following man:—

Jnr. Res. Attdt. S. Rothwell, R.N.A.S.B.R., O.N. M15814 (Po.).

* * *

The following Officer is mentioned in Dispatches:—

Lt.-Comdr. (Act. Comdr.) R. Gregory, R.N.

* * *

The King has been pleased to approve of the award of the following honours, decorations and medals to Officers and Men for services in action with enemy submarines:—

Distinguished Service Cross.

Flt. Lt. Warren Rawson Mackenzie, R.N.A.S.

Bar to the Distinguished Service Cross.

Flt. Sub-Lt. R. F. L. Dickey, D.S.C., R.N.A.S.

Distinguished Service Medal.

Air. Mech., 1st Gr., J. Watts, O.N. F4923.
Act. Air Mech., 1st Gr., E. E. Hughes, O.N., F7223.

* * *

The following Officer and Man have been mentioned in dispatches:—

Flt. Comdr. J. G. Struthers, R.N.A.S.
Air Mech., 1st Gr., G. H. Ellis, O.N., F3423.

* * *

The King has been pleased to give orders for the appointment of the following Officers:—

Distinguished Service Order.

Flt. Lt. Robert Alexander Little, D.S.C., R.N.A.S.

For gallantry in action and for exceptional skill and daring in aerial combats. Since May 9th, 1917, besides having driven off numerous artillery aeroplanes and damaged six hostile machines, he has destroyed six others. On June 26th, 1917, an Aviatik being seen from the aerodrome he went up to attack it. He engaged it and fired a burst at close range, and the enemy machine stalled and went down in flames.

Flt. Lt. Raymond Collishaw, D.S.C., R.N.A.S.

For conspicuous bravery and skill in successfully leading attacks against hostile aircraft. Since June 10th, 1917, Flt. Lt. Collishaw has himself brought down four machines completely out of control and driven down two others with their planes shot away. Whilst on an offensive patrol on the morning of June 15th, 1917, he forced down a hostile scout in a nose-dive. Later, on the same day, he drove down one hostile two-seater machine completely out of control, one hostile scout in a spin, and a third machine with two of its planes shot away. On June 24th, 1917, he engaged four enemy scouts, driving one down in a spin and another with two of its planes shot away; the latter machine was seen to crash.

Bar to the Distinguished Service Order.

Sqdrn. Comdr. Charles Henry Butler, D.S.O., D.S.C., R.N.A.S.

For the skill and gallantry with which he attacked a formation of 15 hostile machines returning from a raid on England. Closing on one machine, he engaged it at close quarters. Presently he saw this machine nose-dive, crash into the sea, and sink. Meanwhile, he had engaged a second machine, but broke off the engagement to follow down the first machine. Afterwards he lost sight of the enemy formation and returned to his aerodrome.

* * *

The King has been pleased to approve of the award of the Distinguished Service Cross to the following Officers:—

Flt. Comdr. Alexander Macdonald Shook, R.N.A.S.

Flt. Lt. Arnold Jaques Chadwick, R.N.A.S. (since reported drowned).

Flt. Sub-Lt. Albert James Enstone, R.N.A.S.

Flt. Sub-Lt. Langley Frank Willard Smith, R.N.A.S. (since missing).

For exceptional gallantry and remarkable skill and courage whilst serving with the R.N.A.S. at Dunkirk during May and June, in repeatedly attacking and destroying hostile aircraft.

Flt. Lt. Cecil Hill Darley, R.N.A.S.

For conspicuous skill and gallantry on the night of July 2nd. One of his engines having seized whilst he was over Bruges, he dropped his bombs on the objective and managed to fly his machine home on one engine and effected a safe landing on the aerodrome.

Flt. Sub-Lt. (now Flt. Lt.) John Edward Scott, R.N.A.S.

For the skill and gallantry with which he engaged a hostile machine returning from an air raid on England. Descending to 8,000 feet, he fired continuously until the enemy machine lost control, descended in a spinning nose-dive, and crashed into the sea.

Flt. Sub-Lt. Ellis Vair Reed, R.N.A.S. (since missing).

In recognition of his services on the following occasions:—

On June 6th he attacked and drove down one of four hostile scouts. This machine dived nose first into the ground and was destroyed. On the afternoon of June 15th he was leading a patrol of three scouts and encountered a formation of 10 enemy machines. During the combat which ensued he forced one machine down completely out of control. Next he attacked at a range of about 30 yards another hostile scout. The pilot of this machine was killed, and it went down completely out of control. This officer has at all times shown the greatest bravery and determination.

Flt. Sub-Lt. Edward Robert Barker, R.N.A.S.

In recognition of his services on the occasion of an air raid on the Solway works at Zeebrugge on the night of July 15th-16th, when bombs were dropped on the objective with good results.

Flt. Sub-Lt. Rowan Heywood Daly, R.N.A.S.

For skill and gallantry in attacking enemy aircraft returning from a raid on England. After a long chase he engaged and brought down one machine in flames. Afterwards he engaged a second machine, but his gun jammed, and, though he continued the pursuit to the enemy coast, he failed to clear the jam, and was obliged to return to his aerodrome.

Flt. Lt. Reginal Rhys Soar, R.N.A.S.

For courage and skill as a scout pilot. On May 23rd, 1917, he attacked a two-seater artillery machine, and as the result of a well thought-out attack brought the machine down out of control. On June 12th, 1917, he brought down two enemy machines out of control. On June 29th, 1917, in company with Flt. Lt. Little, he attacked and brought down an Albatros scout. On July 3rd, 1917, whilst leading an offensive patrol, a formation of seven Albatros scouts was engaged, and he brought down one out of control. On July 13th, 1917, in company with Flt. Lt. Little, he attacked and drove down out of control one two-seater machine, following it down to within 1,000 feet of the ground.

Bar to the Distinguished Service Cross.

Flt. Comdr. Robert John Orton Compston, D.S.C., R.N.A.S.,

For gallantry in action and for very good work in driving away German artillery aeroplanes. On June 12th, 1917, with three other machines, he attacked six hostile scouts. He got close to one and shot it down out of control. On June 16th, 1917, he attacked and brought down a two-seater Aviatik. On July 3rd, 1917, he attacked two Aviatiks, which he drove down and forced to land.

Flt. Lt. John Edward Sharman, D.S.C., R.N.A.S.

For courage and skill in attacking enemy aircraft. On the evening of June 14th, 1917, while on an offensive patrol with three other scouts he observed five Albatros scouts. He dived on one of these, firing his machine gun at about 50 ft. range. The scout then went down in a spin. On June 24th, 1917, with six other machines, he attacked 15 Albatros scouts. After a combat at close range he destroyed one of these, its right plane and tail plane falling off.

* * *

The following awards have also been approved:—

Distinguished Service Medal.

Ldg. A.C., T. Busby, O.N. F18555; A.C., 1st Gr., J. H. Daw, O.N., F12687; A.C., 2nd Gr., C. A. Millhouse, O.N., F22637; Air Mech., 2nd Gr., F. Anderson, O.N. F7389; Air Mech., 1st Gr., T. Caird, O.N., F6181; P.O. Mech. (E) H. Dixon, O.N., F4542.

* * *

The following Officers and Men have been mentioned in dispatches:—

Sqdn Comdr. R. H. Mulock, D.S.O., R.N.A.S.; Flt. Lt. W. R. Mackenzie, D.S.C., R.N.A.S.; Flt. Sub-Lt. R. F. L. Dickey, D.S.C., R.N.A.S.; Flt. Sub-Lt. F. R. Johnson, R.N.A.S.; Flt. Sub-Lt. A. H. Lofft, R.N.A.S.; A.C., 2nd Gr., J. W. George, O.N. F20006.

* * *

The following Decorations have been conferred by the Allied

Powers on Officers and Men of the British Naval Forces for distinguished services rendered during the war :—

CONFERRED BY THE PRESIDENT OF THE FRENCH REPUBLIC.

LEGION OF HONOUR.

COMMANDER.—Rear Adm. C. L. Vaughan-Lee, C.B.; Capt. G. M. Paine, C.B., M.V.O., R.N., Commodore, 1st Cl.

OFFICER.—Capt. A. V. Vyvyan, D.S.O., R.N.; Wing Capt. R. M. Groves, D.S.O., R.N.; Wing Comdr. I. T. Courtney, R.N.A.S. (Capt. and Temp. Lt.-Col., R.M.L.I.).

* * *

CONFERRED BY HIS MAJESTY THE KING OF ITALY.

ORDER OF ST. MAURICE AND ST. LAZARUS.

COMMANDER.—Rear Adm. C. L. Vaughan-Lee, C.B.

OFFICER.

Comdr. C. R. Dane, R.N. (Wing Comdr. R.N.A.S.).

CAVALIER.

Flt. Comdr. D. Harries, R.N.
Flt. Comdr. D. W. A. Barton, R.N.A.S.
Flt. Comdr. F. W. Lucas, R.N.A.S.

ORDER OF THE CROWN OF ITALY.

OFFICER.

Comdr. (Act. Capt.) H. Halahan, D.S.O., R.N.
Comdr. H. L. Woodcock, R.N. (Wing Comdr., R.N.A.S.).

CAVALIER.

Flt. Lt. R. F. E. Wickham, R.N.A.S.
Flt. Lt. R. F. Maitland, R.N.A.S.

The King has given unrestricted permission to the officers and men concerned to wear the Decorations in question.

WAR OFFICE, August 13th.

REGULAR FORCES.—STAFF ATTACHED TO HD.-QR. UNITS.—Brig.-Comdr.—Maj. (temp. Col.) R. E. T. Hogg, C.I.E., Ind. Cav., from a Group Comdr., R.F.C., and to be temp. Brig.-Gen. whilst so empld., June 22nd.

ESTABLISHMENTS.—R.F.C.—MIL. WING.—Staff Officers, 1st Cl. (Graded for purposes of pay as an A.A.G.).—Temp. Capt. F. R. Hedges, Gen. List, from the 2nd Cl., and to be temp. Lt.-Col. while so empld., June 22nd.

2nd Cl. (Graded for purposes of pay as a Brig.-Maj.).—Maj. A. R. Martin, T.F. Res., from Adjt., R.F.C., vice temp. Capt. (temp. Lt.-Col.) F. R. Hedges, Gen. List, June 22nd.

3rd Cl. (Graded for purposes of pay as a Staff Capt.).—Lt. (temp. Capt.) M. Nicholson, R.F.A., T.F., from Adjt., R.F.C., June 22nd.

Flt. Comdr.—Sec. Lt. (temp. Lt.) T. E. Salt, R. War. R., T.F., from a Flying Officer, and to be temp. Capt. while so empld., July 31st.

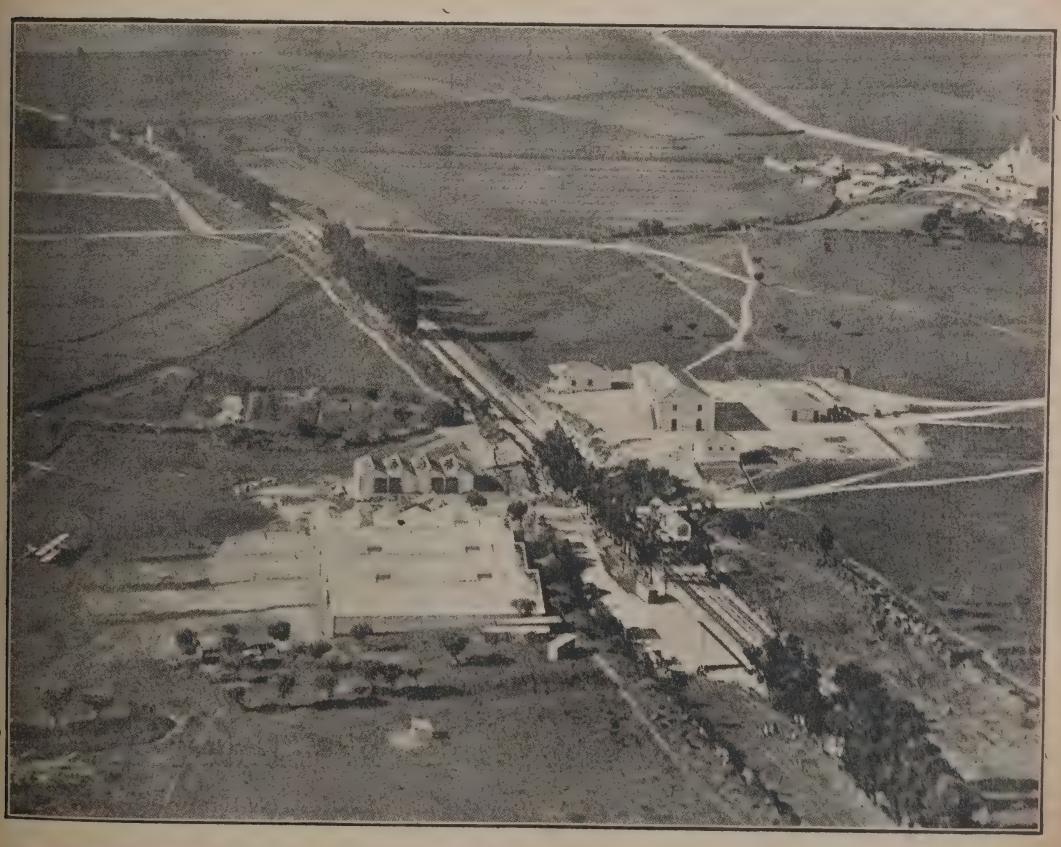
Balloon Co. Comdr.—(Graded as a Flt. Comdr.).—Sec. Lt. (temp. Lt.) J. Mitchell, Spec. Res., from a Balloon Co. Comdr. (graded as a Balloon Officer), and to be temp. Capt. while so empld., July 28th.

ADJT.—Temp. Sec. Lt. (temp. Lt.) W. P. M. Newman, R.A., to be temp. Capt. (without the pay or allowances of that rank) while so empld., and to be transfd. to R.F.C., Gen. List, July 6th.

ROYAL REGT. OF ARTILLERY.—Sec. Lt. J. Young, T.F., relinquishes the acting rank of Capt. on ceasing to comd. an Anti-Aircraft Section, June 6th.

NAVAL.

The following appointments have been made in the Royal Naval Air Service :—



AUGUST 7th.—Lt.-Comdr. (Temp.).—E. Childers, D.S.C., to "President," July 27th.

Temp. commissions as Lt. (R.N.V.R.) have been granted to D. M. S. Watson, F. H. Illingworth, A. H. Dungay, and W. A. Powell, all seny. August 6th.

Temp. Flt. Sub-Lts.—J. A. Glen and H. F. Beamish specially promoted to temp. Flt. Lt. for meritorious war service, to date August 5th.

Temp. Flt. Sub-Lt. W. H. Mackenzie promoted to temp. Flt. Lt., with seny. June 30th.

AUGUST 8th.—Lt.-Comdr. R.N.V.R. (temp.).—R. A. Chalmers, graded as Act. Sqdn. Comdr. (temp.), seny. August 6th.

[Reproduced from the Official Bulletin of the Portuguese Aero Club.

FLYING IN PORTUGAL.—The Portuguese Army's Aviation School at Vila Nova da Rainha.

August 10th.—Mr. S. H. Page, granted a temp. commission as Lt. (R.N.V.R.), seny. August 8th.

August 11th.—Flt. Lt. (Temp.).—O. A. Butcher, granted rank of Act. Flt. Comdr., seny. August 10th.

W.O. (2nd grade).—H. A. Saunders, promoted to Lt. R.N.V.R. (temp.), seny. August 8th.

A.C. (2).—A. J. W. Giles, entered as Lt. R.N.V.R. (temp.), seny. August 6th.

Mr. J. C. Isaacs granted a temp. commission as Lt. (R.N.V.R.), seny. August 9th.

Admiralty Communiqués.

August 11th.—Several tons of bombs were dropped by the Royal Naval Air Service during the night of August 9th-10th on the following military objectives:—

Ghistelles Aerodrome.

Zuidwege railway sidings.

Thourout railway junction.

Dense clouds of smoke were caused at Zuidwege. The railway junction at Thourout was also attacked by gunfire from the air.

Yesterday afternoon (August 10th) a further bombing raid was carried out on the aerodrome at Sparappelhoek.

All machines returned safely.

August 13th.—One hostile aeroplane, Gotha type, was destroyed during the return of the raiders to the Belgian coast, and one hostile seaplane was destroyed off the coast of Flanders at approximately the same time.

A large number of R.N.A.S. machines engaged the other raiders oversea, without decisive result.

The pilot who destroyed the Gotha, and who was flying a land machine, reports that he first pursued an enemy aeroplane flying at 12,000 ft. from the North Foreland to about 15 miles off Zeebrugge, where he lost the hostile aircraft. Returning to the mouth of the Thames he observed anti-aircraft fire bursting in the vicinity of Southend and flew in that direction climbing.

He then observed eight Gotha aeroplanes followed by four British machines steering north-east. The enemy machines were about 2,000 ft. above him when he got beneath them; he pursued, climbing to 18,000 ft., and attacked without result when about 30 miles out to seaward.

At this moment he saw a single hostile machine 4,000 ft. below the enemy formation, but flying with it. He attacked from the front and drove the enemy down to the water, where he observed him turn over, and saw one of the occupants hanging on to the tail. Thereupon, he threw him his lifebelt, and did two or three circuits around him before returning to England. While returning he endeavoured to communicate the position of the hostile machine to British destroyers.

The Casualty List.

Reported August 10th.

Previously reported Missing, now reported Killed.—Richardson, Flt. Lt. (Act. Lt., R.N.R.) W. H., R.N.

Mr. James R. Barry, Midshipman, R.N.R.

Previously reported Missing (Believed Killed), now presumed Drowned.—Chadwick, Act. Flt. Comdr. A. J., D.S.C., R.N.

Previously reported Missing, now presumed Killed.—Peberdy, Flt. Lt. W. H., R.N.

Reported August 11th.

Accidentally Killed.—Dunning, Sqdn. Comdr. E. H., D.S.C., R.N.

Slightly Injured.—Leather, Flt. Comdr. G. V., R.N.

Mayes, Prob. Flt. Officer H. R., R.N.

Reported August 13th.

Killed.—Casey, Act. Flt.-Comdr. F. D., D.S.C., R.N.

Missing (Believed Killed).—Woodhouse, Flt. Sub-Lt. M. G., R.N.

Missing.—Munro, Flt. Sub-Lt. K. R., R.N.

Bridge, Flt. Sub-Lt. B. H., R.N.

PERSONAL NOTICES.

Deaths.

DUNNING.—Sir Edward Dunning, of Jacques Hall, Bradfield, Essex, has been informed of the death of his son, Sqdn.-Comdr. Edwin Harris Dunning, R.N., while flying. Sqdn.-Comdr. Dunning was 25 years old, and was wounded on June 20th last year while fighting an enemy airship in the Ægean, for which he received the D.S.O.

He was born in 1892, and was educated at Fonthill, and at the Royal Naval Colleges at Osborne and Dartmouth. On the outbreak of war he joined the R.N.A.S. He was wounded on June 20th, 1916, in an air fight over the Ægean, and received the Distinguished Service Cross for his gallantry on that and other occasions. He was flying as a pilot with Lt. Oxley, C.B., D.S.C., as observer, on escort and reconnaissance patrol for a flight of bombing machines. Two enemy machines were engaged at close range and forced to retire, and as his machine withdrew Sqdn. Comdr. Dunning was hit in the left leg and the machine was badly damaged. His observer improvised a tourniquet and took control of the machine while Sqdn. Comdr. Dunning adjusted the tourniquet. The pilot was obliged to keep his thumb over a hole in the petrol tank in order to preserve sufficient fuel to reach the aerodrome, where he made a good landing.

The funeral took place on August 11th at Bradfield parish churchyard. Sqdn. Comdr. Dunning was killed while flying in the North.

Engagements.

KEANE—MONTGOMERIE.—A marriage has been arranged, and will take place (leave permitting) at Christ Church, Down Street, Mayfair, on the 21st inst., at half-past two o'clock, between Flt. Sub-Lt. E. J. Keane, R.N., and Evelyn Mary Montgomerie (late Q.A.I.M.N.S.R.), eldest daughter of James C. Montgomerie, 9, Walpole Gardens, Strawberry Hill, Middlesex. There will be no reception, but friends will be very welcome at the church.

SHOPPEE—TAIT.—The marriage of Flt. Lt. L. Conrad Shoppee, D.S.C., R.N., and Hilda Gifford Tait, will take place at East Cowton Parish Church, Northallerton, Yorks, on September 5th, at 2.30 p.m. The ceremony will be performed by the Lord Bishop of Knaresborough, assisted by the Rev. R. Gifford Wood, uncle of the bride.

Marriages.

BROWNE—CAPPON.—On the 7th inst., at St. Mary's Church, Caterham, Flt. Lt. Chetwode W. C. Browne, R.N., only son of Willis Browne, Esq., of "The Beeches," Caterham, was married to Dorothy Janet, younger daughter of the late James Cappon, of Fifeshire, N.B., and Mrs. Howard Goodman, of Banavie, Caterham, by the Rev. G. A. Leslie Colvill, of Madron Vicarage, Heamoor, S.O., Cornwall, assisted by the Rev. Prebendary Heard.

LOUTH—EVERITT.—On August 4th, at Reading, Prob. Flt. Officer Trevor Louth, R.N.A.S., was married to Dora May, daughter of Mr. H. A. Everitt, of Reading.

MILITARY.

G.H.Q. Communiqués.

August 8th, 9.5 p.m.—Yesterday, in spite of continuous mist and clouds, our aeroplanes bombed the enemy's railway tracks, sidings, and trains 40 miles behind the German lines, causing much damage, and, in particular, derailing one train and blowing up another. Bombs were also dropped during the previous night on an enemy ammunition depot.

One of our machines is missing.

August 9th, 9.6 p.m.—Work in the air was continued yesterday, although bad weather again interfered greatly with flying.

In air fighting, two German aeroplanes were brought down, and one other was driven down out of control.

None of our machines are missing.

August 10th, 9.56 p.m.—There was great activity in the air yesterday on both sides, but a strong westerly wind and thick clouds made it difficult for our aeroplanes to engage the enemy's machines. Bombing and artillery work were carried out successfully during the day.

In air fighting, five German aeroplanes were brought down and five others were driven down out of control. In addition two German observation balloons were brought down in flames and four others were driven down badly damaged.

Four of our aeroplanes are missing.

August 11th, 9.27 p.m.—Yesterday, for the first time for over 10 days, a full day's flying was possible. Enemy aircraft showed great activity, crossing our lines in many places, attempting to prevent our artillery work, and attacking our bombing machines. In spite of their efforts, a great deal of successful artillery observation work was carried out by us.

A large number of photographs were taken, many targets on the ground were effectively engaged with machine-gun fire, and, in the course of the day and night, six and a half tons of bombs were dropped on the enemy's aerodromes, ammunition depots, and other points of military importance.

Fighting was very severe all day, the enemy being encountered in large formations. 10 German machines were brought down by our aeroplanes and 5 others were driven down out of control. Another enemy machine was driven down out of control by gunfire.

Twelve of our machines are missing.

August 12th, 8.58 p.m.—In spite of repeated storms and strong westerly winds, which greatly favoured the enemy, our aeroplanes carried out much successful work again yesterday.

In air fighting 3 German machines were brought down and 4 others driven down out of control.

Two of our aeroplanes were forced to land behind the enemy lines, and 3 other British machines are missing.

August 13th, 8.40 p.m.—Our aeroplanes and balloons carried out a great deal of successful work yesterday in conjunction wi

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The Production of Aeroplanes and their Components

(Ninth Instalment.)

BY STEPNEY BLAKENEY.

Wiring Plates.

The metal, together with the job and instruction card, and the blue print having been received, the foreman will then give the blue print to the setter-out, together with the instruction card.

The setter-out will then take a piece of thin metal, and set out the wiring plate. This will, on completion, be sent to the inspection department to have the setting-out checked with the drawing. It can then, if passed, be sent to the template maker, who will produce one setting-out template.

When this is done the template will be sent to the inspection department. If correct, it can then be sent for the final inspection to the A.I.D.

When this is passed, the marker-off will mark out on the sheet steel to be used a number of the parts as specified on the job and instruction card. This sheet of steel will then be handed to the operator on the metal jig-saw, who should at once proceed to saw out the parts set out on the sheet of steel, as closely to the outside of the scriber lines as is possible, but taking care at all times to leave the line visible.

Manual Work.

As soon as some of these parts are roughly cut out, certain of the bench hands should at once be detailed to commence finishing these off, and as the remainder of the batch come from the metal jig-saw, they also should, if possible, be distributed amongst further workers.

By this means a large number of components can be quickly put through the works, and passed to the inspection department who, if they find them correct, will pass them into the finished part stores. In this manner all parts required by the erectors can be made; and, if the progress department see that the right proportion of parts of various kinds required are made each day, there should be perfect progress. If there is not, the progress department should adjust and alter the numbers of parts demanded from the metal department, or the number of hands employed on any special kind should either be increased or decreased.

Drilling Plates.

The wiring plates having been filed up to shape and finished, the next thing will be the drilling of the holes at each end to take the A.G.S. pins of the fork ends, which are screwed on to the tie rods.

The necessity for these being perfectly drilled in their correct position, and absolutely at right angles through the wiring plates, renders it necessary to construct a drilling jig, in which one or two wiring plates may be drilled at one time, according to the design of the jig.

A Drilling Jig.

An easy way of making a jig is first of all for the expert setter-out to mark off the holes on a perfect wiring plate with the greatest possible care. He should use a sharply pointed fine centre-punch, and "centre pop" the centres of all holes required with absolute accuracy, especially taking care to hold the centre-punch vertically over the position of the hole which it is intended to drill, as if this is not done it will be found that the holes when drilled are not accurate, and just a couple of hundredths out of their correct theoretical position. Therefore give this simple matter the attention it richly deserves, as if this is not done it gives the small twist drill a lead off in the wrong direction.

Having done this, take a pair of fine spring dividers and set out the outside diameter of the hole, just a shade larger than the true size, so that when commencing to drill the hole, before allowing the drill to cut its full diameter cut, it will be possible on examination to satisfy yourself that the hole when drilled, will be truly concentric with the small circle made by the spring dividers. If it is not concentric, alter it, or, as it is known in drillers' language, "draw the hole," to its correct position. This is done by means of a small, accurately ground, diamond-pointed chisel, cutting a small chip out of the side to which it is intended, or necessary, to draw the hole.

Preparing the Jig.

Assuming that we have drilled the wiring plate with a 3/32-in. drill in all holes, irrespective of their final required size, this operation only being done for the purpose of assisting us to produce an accurate drilling jig, take the wiring plate and lay it on a piece of $\frac{3}{8}$-in. or $\frac{1}{2}$-in. thick steel plate, say in this case about 6 in. by $3\frac{1}{2}$ in., previously carefully levelled by shaping up each face parallel to the other, and locate the wiring plate in the centre as near as possible. This plate will ultimately become the jig. Clamp it there, and accurately mark the holes off the wiring plate onto the jig-plate.

Having done this, unclamp the wiring plate, and with the spring dividers set out a $\frac{1}{8}$ in. circle round each centre pop so that when you commence drilling you can see that the drilling is going to be accurate.

The 3/32 in. holes having been drilled in the $\frac{3}{8}$ in. steel plate, take the wiring plate and lay it again on the steel plate, and either rivet it in position, with a rivet at each end, and if possible one in the middle, or bolt it on. This being done, the jig-maker can fit a semi-circular piece of steel, $\frac{1}{4}$ in. thick, round each end of the wiring plate lugs, to keep it in position, leaving each piece big enough to be drilled and riveted in position.

SKETCH OF DRILLING J.I.G.

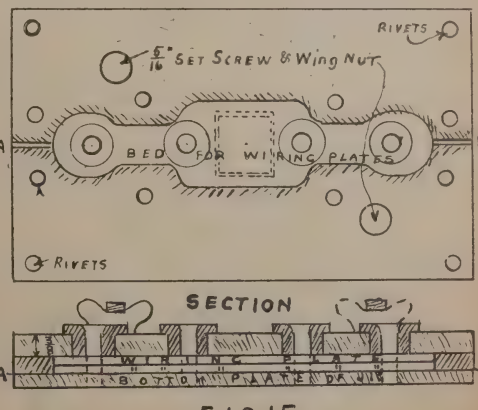

FIG 15

These pieces having been fitted, the next thing to do is to fit a ¼ in. piece, or strip, of steel to each side of the wiring plate, and when accurately fitted, rivet them to the ⅝ in. steel plate. The four pieces thus fitted form a bed for the wiring plates to be dropped into, say, two of them, or any other number according to the gauge of the steel.

This work having been completed, remove the temporary rivets from the wiring plate, and enlarge the holes previously occupied by the 3/32 in. rivets, in the steel plate and the other holes, to a size equal to about 3/16 in. bigger in diameter than the required size specified on the drawing.

This is done to enable the hardened steel drill guides, or bushes, to be fitted into the holes drilled in the ⅝ in. steel plate. These are necessary because an ordinary hole is liable to wear out of shape and cause inaccurate drillings, and, as these bushes are removable, they can always be replaced with new ones when worn.

Making Drill Bushes.

The hardened steel bushes should be made to the following dimensions. Assuming the diameter of the hole in each end of the wiring plate lugs is 3/16 in., it follows that a 3/16 in. twist drill will be used. Therefore the hole in the hardened steel bush will be drilled 3/16 in. The depth of the bush should be about equal to five diameters of the drill, which equals in this case 15/16 in. The walls of the bush may be, say, ⅛ in. thick each side plus the 3/16 in. hole.

The total diameter of the bush will, therefore, equal 7/16 in., the length being equal to the thickness of the jig plate, namely, ⅝ in., and finishing up with a square shoulder, say, of ⅛ in. wide, making the total diameter of the bush about 11/16 in., with the entrance to the 3/16 in. hole nicely rounded.

These bushes will be a pressing fit into the holes in the ⅝ in. plate.

Having fitted similar bushes to all holes in the jig plate, the next thing will be to make a cover plate over the bottom of the jig to keep in the wiring plates tightly whilst they are being drilled. For this purpose we can use a piece of plate about ¼ in. thick, fitted with two hinged bolts and wing nuts, which fit into slots in the upper plate. This allows the wiring plates to be drilled in this jig being tightly clamped up to the underside of the drilling jig plate accurately in position. Having fitted this plate the jig can be tested, and if found correct, can be put into general use in the machine shop. (See Fig. 15.)

These jigs, although involving some trouble to make, very quickly pay for themselves, as the drilling is accurate, and thus no wiring plates will be scrapped, which is the principal point in our days, when time and material are scarce and rapid production is essential.

Strut Sockets.

Having completed the drilling of the wiring plates and bent the lugs, the next thing to make is the small square steel shoe which has to be attached to the wiring plate by either brazing or welding. This shoe is necessary as a stay or bed for the strut end.

The way this may be made is to take a strip of steel equal in length to the total of the four sides plus an eighth for bends, and bend it round a steel mandril of the correct size, and weld the joint together. After this, the ends may be trued up until the shoe is ⅛ in. deep. It can then be clamped on to the wiring plate in its correct position, and welded in the welding shop by the oxy-acetylene welding process. It should be noted by all that the welding must be neat and thorough, as no filing of welded work is permissible under any circumstances; and considerable care must be taken by the operator not to overheat or burn the fitting.

(To be continued.)

STRUT TAPERING.

The following letter has been received apropos Mr. Blakeney's remarks on strut tapering :—

Sir,—In reply to Mr. Blakeney's query re tapering of struts on the overhand, I shall be delighted if I can do anything which tends to increase our output of machines at the present moment. Some machinists will know the method, but presumably there will be some who won't.

The front bed of the overhand is always kept level with the track of the knives (except when altered for a special job). Now suppose a strut 3 ft. long, 3 in. by 1¼ in., which we want to taper to 2 in. by 1¼ in. at the ends, leaving 3 in. full section at the centre. See sketch (Fig. A) :—

First of all set the back bed ⅛ in. below the track of the knives, then clamp thereon a piece of wood 16½ in. from the joint of the front bed. (Note.—Those sizes will require a little adjustment in practice.)

Put the end of the strut against this piece, then gradually bring the strut down onto the front bed, and push it along, taking care to keep the rear end of the strut down on the bed. A glance at the sketch (Fig. B) will, perhaps, make it clearer. Of course, the operator has to keep a firm grip of the job!

It will be found that the wood has been gradually taken off from nothing to ⅛ in. I have the ends of the main spars tapered after the same principle, but do not use the piece of wood clamped onto the back bed. The spars are marked and simply laid onto the line.

If a camber be required on the struts instead of a straight taper it would be best to cut at the bandsaw and clean off on the spindle, using the ring and a template.

Working straight against the spindle no adjustment of the cutter is possible unless you cut only one side, which is very bad practice.—D. D. Haldane.

Mr. Blakeney replies :—

Sir,—In reply to Mr. Haldane's letter, the information contained therein is exceedingly useful, and in the interests of those whose experience of woodwork is not as extended as they might consider desirable, it certainly serves a most useful purpose to find space for his letter.

I have made some sketches, which will, I trust, convey to those interested in the subject the methods used and referred to by Mr. Haldane.

I think if Mr. Haldane studies all the various types of spindles in use that he will find many in which it is possible to work against the spindle, using two cutters and adjust same. This is done by using loose collars on the spindle and gripping the cutters in parallel slots in between.—S. B.

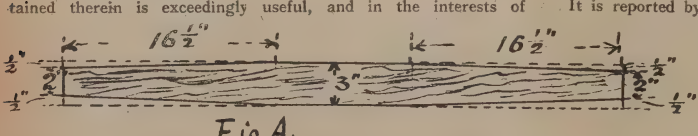

Fig. A.

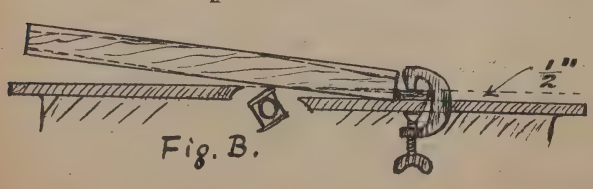

Fig. B.

AMERICAN TRADE NOTES.

It is intended that a permanent exhibit of aircraft materials, including engine parts and sections of planes, will shortly be opened at Washington, D.C., by the National Advisory Committee for Aeronautics and the Aircraft Production Board. This exhibit is intended principally for the education of manufacturers whose previous experience would lead them to aircraft work.

The example might be followed with advantage by the British Services.

* * *

According to the American newspaper, "Aviation," of July 1st, the Aircraft Production Board has officially announced that a group of nearly 125 "experts" sent from America to study the manners and customs of the British Aircraft Industry has safely arrived in England. It occurs to one that the depletion of the small stock of aviation "experts" available in the United States by the number of 125 will result in a considerable increase in the output of the American industry!

Doubtless, the British Industry would be glad to get rid of some of the official experts in a similar way.

* * *

It is reported by the American Press that there are now "100 Curtiss J.N.4 type machine in use on the French front in reconnaissance and artillery spotting work." It seems more probable, however, that the machines are being used for training purposes.

* * *

The International Committee to standardise the metal parts of aircraft held its first meeting at New York on August 8th. Representatives of the United States, Great Britain, France, Italy, and Canada were present. The work is expected to reduce the thousands of metal parts now in innumerable sizes to a few standard shapes, thus facilitating aircraft production on an enormous scale for the Allies.

THE NEW STEEL

COBALTCROM PATENT AIR HARDENING HIGH SPEED STEEL

(TUNGSTENLESS HIGH SPEED STEEL).

BRITISH PATENT No. 106187. **Patents applied for in all Foreign Countries.**

THIS Steel is specially suitable for Milling Cutters, Twist Drills, Reamers, Taps, Automatic Forming Tools, Screw-cutting and Finishing Tools in general, and for these purposes is **fully guaranteed** to give equal endurance to Best Tungsten High-Speed Steel, producing, however, a better finish and tougher tools.

FOR machining Gun Metal and Yellow Metals in general, for High-Endurance Drawing and Blanking Dies, Lathe Centres, Shear Blades, Press Tools, Valves for Aeroplane and Automobile Combustion Motors, and all kinds of Gauges and Instruments in general which have to resist abrasion, the Patent Cobaltcrom Steel is clearly superior to Best Tungsten High-Speed Steel.

For turning Chilled Rolls and Skidded Railway and Tram Tyres at customary speeds, it equals in efficiency Best Tungsten High-Speed Steel.

ALSO recommended for Machine File Cutters' Chisels, Engravers' Chisels, Pneumatic Tools, Trimming Dies, Drop Hammer Dies, Needle Swaging Dies, Coin Dies, Cutters and Dies for Nails, Tack and Tingle Manufacturing, Cold Heading Dies, Hot Bolt Forging Dies, Rivet Dies, Snaps, Pipe Cutters, Mandrels, as well as for inserted teeth for Saws and Milling Cutters.

Tool Makers who have thoroughly tested Cobaltcrom Steel for **press tools**, declare it a **wonder of simplicity, utility and economy**, and predict its universal adoption in preference to any other known brand of press tool steel, as its use assures complete absence of cracking risks in the hardening of the most intricate shaped tools. Shrinkage and deformation of Cobaltcrom steel tools during hardening being practically nil, the saving in rectification costs alone, when compared with carbon tool steel, compensates for any difference in the price of material. In addition to this, at least 6 to 8 times greater cutting duration is obtained with Cobaltcrom Steel, the tools producing glassy, non-burring cuts.

Cobaltcrom Patent Air-Hardening Tungstenless High-Speed Steel is supplied in bars of all commercial sections and sizes, in sheets from 1/32 in. and thicker, and in round bright drawn polished lengths.

Annealed Castings for Cuttings, Gauges, etc., to customers' approved patterns are also supplied.

The cutting efficiency of tools made from castings annealed and hardened is quite equal to that of similar tools made from forged or rolled bars.

Hurry orders for blanks for Milling Cutters, rough machined to within 1/16 in., can be executed within 48 hours after receipt of telegraphic or telephonic instructions.

Finished articles supplied from Cobaltcrom Steel :—Power Hacksaw Blades, Milling Cutters, Shear Blades, and Twist Drills.

Air Hardening is effected at 1000° Centigrade, a considerably lower and less risky heat than required for Tungsten High-Speed Steel.

As the specific gravity of Cobaltcrom Patent Air-Hardening Tungstenless High-Speed Steel is 10 per cent. below that of Tungsten High-Speed Steel, it means that, taking weight for weight, a greater bulk of material is obtained, resulting in an appreciable gain to the user.

CANNON

Glue for Use on Aeroplanes.*

By PERCY A. HOUSEMAN.

[From "Aviation," New York, July 1st, 1917.—Hence the use of the word "airplane."]

There are many parts of an airplane that require the use of an adhesive material. Of these may be mentioned "airscrews" (the collective name for propellers and tractors), hollow spars, booms, ribs, plywood, etc. For some of the small parts, such as the ribs, which are subsequently covered by "doped" fabric, it is not necessary to use the best quality of glue. For other parts, however, it is of vital importance that only the strongest glue be used. This applies particularly to airscrews, which rotate at a very high speed.

Airscrews are built up in laminæ of walnut or mahogany, usually 7 in number, and each 1 in. thick. It is usual to glue two laminæ together, and allow them to remain in clamps for a period of from 6 to 24 hrs. before gluing on the next lamina. The finished airscrew is shaped out after the total number of layers have been glued together and have been allowed to set. The glue is applied hot, and usually by at least two workmen, in order to cover the surface as quickly as possible. The temperature of the gluing room is kept above 70 deg. Fahr. It would, of course, be an economy to glue at one operation all of the laminæ of an airscrew, but this is not possible when a cake glue is used, on account of the rapidity with which the hot solution sets. Attempts have been made to overcome this difficulty by the use of "liquid" glues, but these have usually proved unsatisfactory. One French liquid glue contained some hygroscopic material, and failed to set in 14 days. "Liquid" glues should be used only on work in which great strength under widely varying conditions of temperature and humidity is not of prime importance. Bone glue should never be used on aircraft work. The best results are obtained from skin or hide glues.

In working out a method for the examination of glue some attention was given to such chemical and physical tests as moisture, ash, nitrogen, strength of jelly, viscosity, percentage precipitable by alcohol (Stelling's test), etc., but while the information furnished by these tests was of interest, it was not found possible to correlate definitely the results obtained, with the value of the glue for airplane work.

A method was, therefore, developed to test the strength of a glued joint under various conditions. Experiments were made with blocks of biscuit-ware, as recommended by Rideal in his book on "Glue and Glue Testing." Messrs. Doulton, of London, kindly made the necessary blocks, which had a base (*ab*) 1 in. square, similar in design to that shown in Fig. I.

Two such blocks were glued together under various conditions of strength of glue solution, temperature, method of application, pressure of clamping, etc. The blocks were pulled apart in a cement-testing machine with automatic application of the load, but as uniform results could not be obtained, the stone blocks were abandoned. More uniform results were obtained with wood, which also has the advantage of giving results more nearly comparable with those obtained under actual Service conditions. Pieces of carefully selected straight-grained walnut were used, and from them a number of different types of joints were prepared, and used to illustrate different kinds of stresses. The type of joint finally adopted is that shown in Fig. II. This joint gives by no means a true shear, as was easily seen by examining under polarised light a celluloid model made to scale. A stress more nearly approaching pure shear would probably be obtained with a joint like that shown in Fig. III, made up from pieces 9 in. by 2 in. by ¼ in. but for the purpose of obtaining comparative results, that shown in Fig. II answers well, and has the advantage of simplicity.

The wood is exposed for 24 hours to a temperature of 35 deg. Cent. before making the joint. The test pieces (*A*) are 9 in. by 2 in. by ⅜ in. These were roughened by a toothed plane, as it was found that a roughened surface gives a stronger joint than a smooth one. The distance pieces (*B*) are 3 in. by 2 in. by ⅜ in. The area of the glued surface of the joint to be pulled apart is 4 sq. in. To prepare the glue, it is broken into small pieces, and is soaked over night in the requisite amount of water. For the gelatine types of glue, 1 part by weight of glue to 2 parts by weight of water gives a desirable concentration, while for "Scotch" glues 1 part of glue to 1.25 parts of water gives the best results. For other types of glue the water required usually falls within these limits. The soaked glue is dissolved by warming to 60 deg. Cent., and the solution is applied at that temperature. The joints are clamped under moderate pressure for 48 hours, and are tested after a further 24 hours. For each sample of glue, the following three tests, each in duplicate, are carried out on the joints prepared as described above.

Regular Test.

The joints are pulled apart in a Buckton and Wicksteed or in a Riehlé (Philadelphia) Testing Machine and the breaking strain per sq. in. of glued surface is recorded. The experimental variation is less than ± 10 per cent., most of which may be ascribed to unavoidable variations in the wood.

Heat Test.

The joints are subjected to dry heat in an electrically heated oven for 2 days at 45 deg. Cent., and then pulled apart, and the breaking strain recorded.

Immersion Test.

The joints are completely immersed in water at 20 deg. Cent. for 12 hours, and are then pulled apart, and the breaking strain recorded.

BLOCKS AND JOINTS FOR GLUE TESTING

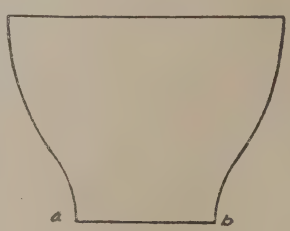

FIG. I

FIG. II

FIG. III

The last two tests are intended to throw light on the behaviour of an airscrew under the extreme conditions of a tropical climate and high humidity. Tests were also made with moist heat, and on immersion followed by dry heat, but were discontinued. The last-named test was found to be too drastic, all glues giving very low results.

The whole procedure outlined above is an arbitrary one, and for this reason it is necessary rigidly to standardise and adhere to the technique of the method, in order to obtain comparable results. When the break occurs in the wood, as frequently happens in the regular test, one can, of course, only say that the glue is stronger than the wood, and record the figure at which the wood breaks.

Addition of phenol to the glue improves the regular test. The influence on heat tests and on immersion tests is not marked, but the tendency is to raise them slightly. The addition of 5 per cent. phenol to a 1 : 2 gelatine solution, depressed the setting point of that solution from about 26 to 18 deg. Cent., while 10 per cent. phenol caused the solution to be still viscous at 5 deg. Cent. The addition of 5 per cent. phenol to glue solutions to be used on airplane work is, therefore, to be recommended, both

because of its tendency to increase the strength of the joint, and also on account of its action in depressing the setting point.

Ammonia causes the glue to set more rapidly. It was found to have the unexpected effect of raising the figures for heat and immersion tests, while leaving regular tests little affected.

The Germans appear to have used a casein glue on some of their aircraft. An analysis of a Swiss glue of this type showed its composition to be about 66 per cent. casein and 23 per cent. mineral matter. The latter was composed of soda, silica, lime and alumina. About 1 per cent. of petroleum was present in the powder. This casein glue is prepared for use by rubbing up with cold water. It requires about 3 days for the joint to set, but has the advantage that all the laminæ of an airscrew can be glued together at once.

The following test figures were obtained on joints made with the Swiss casein glue:

Regular.		Dry Heat.		Moist Heat.		Immersion.	
551	655	526	661	448	465	672	862

The immersion test is particularly high.

Casein glues are very generally used for cementing together the "veneers" on ply-wood which finds extended use in the body and other parts of the airplane. One English firm uses a mixture of casein, lime, and blood, which yields a cement very resistant to water. A three-ply board made with such a cement will withstand an immersion test in water at 50 deg. Cent. for 12 hours without any separation of the plies, though the strength of this cement on a "regular" test is inferior to that of a hide glue.

Another firm of ply-wood manufacturers uses lime and casein only, in the proportion approximately of 4 parts by weight of lime to 7 parts by weight of casein. Casein and borax form a good mixture, but are, of course, more expensive than casein and lime. Casein glues cannot be kept more than a few hours after mixing with water, so that a batch when mixed must be completely used, or the residue wasted.

When a new glue is intended for use on airscrews, the tests described above should be supplemented by a practical test of spinning a trial airscrew with the new glue.

Table I—Influence of Addition of Phenol or Concentrated Ammonia to Glue on Strength of Glued Joint.

Glue Tests	Regular.		Heat.		Immersion.	
Gelatin A	644	627	459	...	504	...
Gelatin A + 5% Phenol	532*	616	476*	627	621	...
Gelatin A + 10% Phenol	677*	845	369	487	560	660
"Propeller" Glue	464	...	470	464	540	504
"Propeller" Glue + 5% Phenol	526	593	395*	506	553	560
"Propeller" Glue + 10% Phenol	610	632	315	429	560	565
"Scotch" Glue	548	571	448	470	448	470
"Scotch" Glue + 5% Phenol	688*	723	425	425	532	548
"Scotch" Glue + 10% Phenol	694	694	414	453	436	476
Gelatin A	627	644	459	565	504	549
Gelatin A + 2% Ammonia	610	655	616	688	800	875
"Propeller" Glue	464	...	464	470	540	504
"Propeller" Glue + 2% Ammonia	520	532	580	609	648	783

The figures represent breaking strain in lbs. per sq. in. of glued surface of the standardised joint. Breaks in the wood are indicated thus*.

THE CASE OF AUTOGENOUS WELDING.

II.

And truly autogenous welding for one, though beneath practical consideration at its worst, at its best may go very far indeed. Even for the straight away creation, from tube, sheet or channelling, it is no exaggeration to say that it begins where press and anvil, core and print, lathe and milling-tool, retire incompetent. While as for repairs, it literally spells salvation for the Gehenna of the junk merchant; from the greasy depths of which it can snatch its crowning triumph, in the mended gear, not only true-pitched and tempered as ever, but actually strengthened. If savings make rich its increment is as sovereigns to shillings. Logically considered, it should abolish the scrapheap. On the other hand, used for pure destruction and removal of the remains to provide new raw material, blow-pipe, and oxygen-tube between them could even effect economy in an Admiralty dockyard.

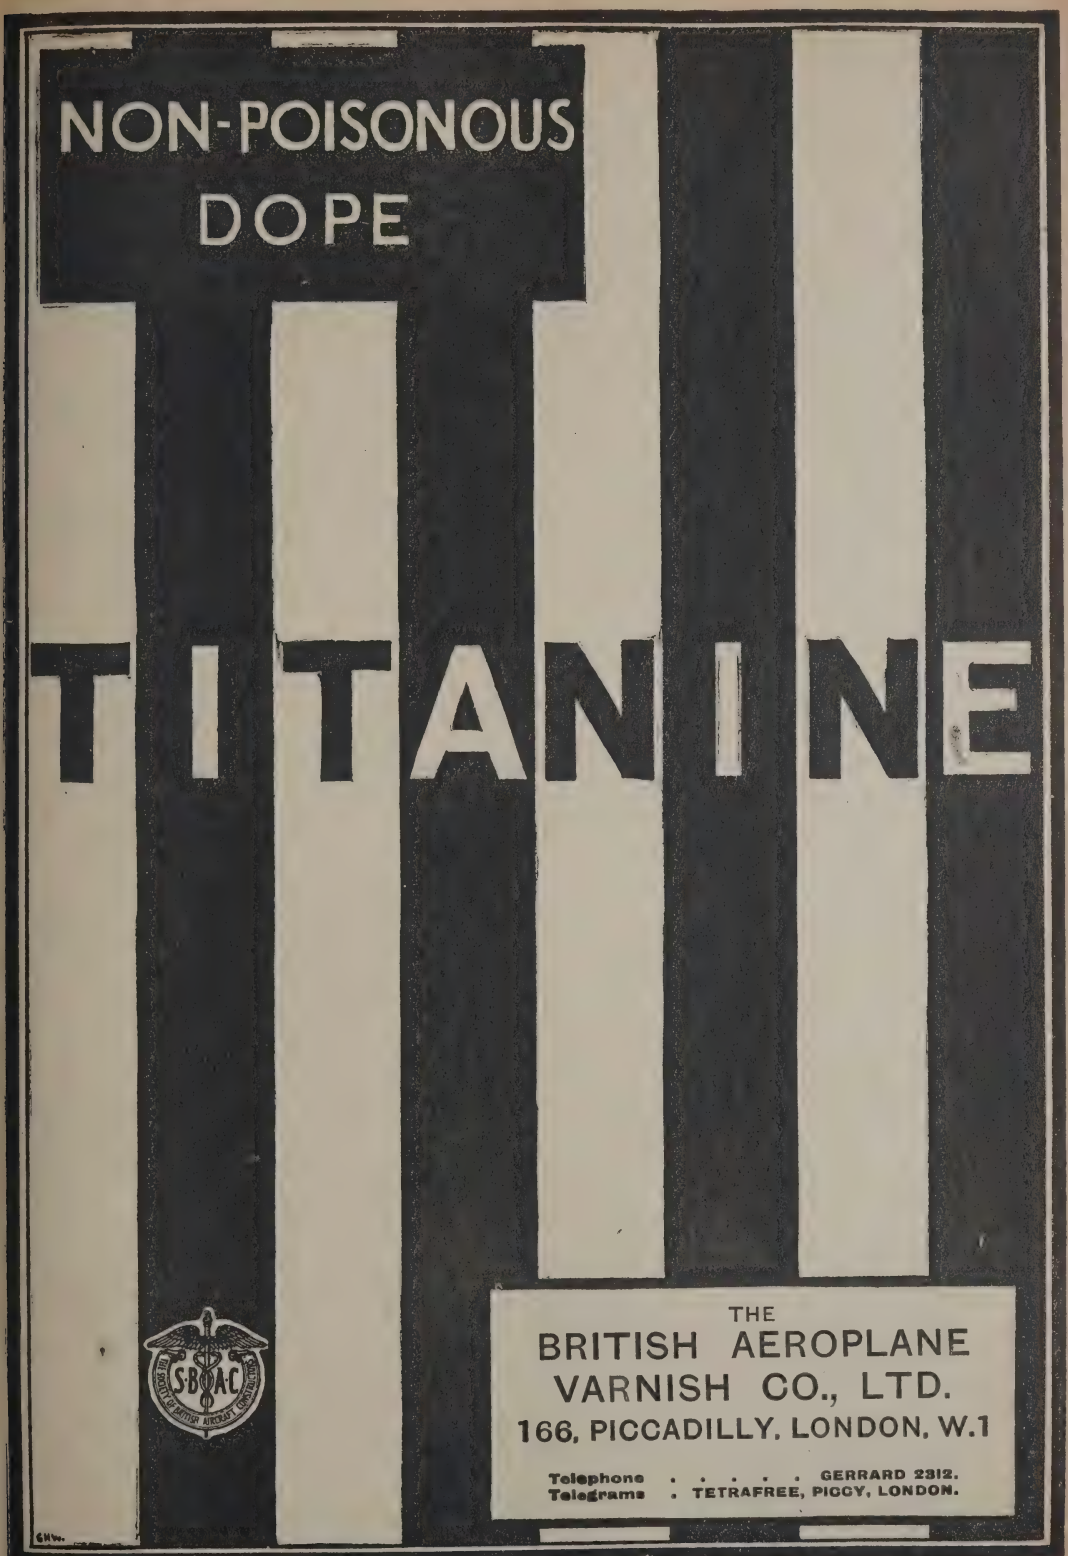
Now, to come to some of its practical detailed points after this general disquisition of the merits of autogenous welding, the main thing to consider is its treachery, and the need for all sorts of counter-dexterities. There are more or less accepted rules—albeit liable to be falsified out of hand by a change from one metal to another—which prescribe a definite-sized jet—that is, one in which the pressure and flame are regulated by the bore of the supply nozzle—for different thicknesses of metal. For this reason alone, there is one British made blow-pipe with a trigger controlled revolving multiple jet.

Yet, given a correct start to this extent, the immediate demons are carbonisation—the result of an over-mixture of acetylene—which fouls the work out of hand, masks the flux, and generally results in adhesions—and oxidising, the result of too much oxygen, which chemically degrades the mechanical value of the metal. Here, again, the above-mentioned blow-pipe scores, for upon a constant pressure of acetylene, the oxygen supply can be regulated to perfection by a needle-valve with a milled thumb-nut. "Can be" is the phrase; for the trouble is to persuade the average *chalumier* to use it, and not to attempt regulation from the tube or gas container.

Having then, got so far as the perfectly adjusted flame in even volumes, from one-third to half an inch long—again according to the job in hand—what comes next? The choice of the right flux, of which there be many. There is one—the trade secret of the greatest wizard in metals I ever knew—of which the material will never run short so long as there are broken bottles, granite and—horses. The thing is to make it up. There are others, compounded of sal-ammoniac, silicon—for cast-iron—phosphorus—for copper or bronze—aluminum for brass; lithium potassium—pure and in the fluoride or bisulphate; borax, sodium borate; boracic acid; and many other substances; for which compounds the various "best" formulæ are generally known, but which may well be varied—as experience brings the practitioner into the higher flights.

Now, the real purpose of a flux is, of course, to keep the actual metal under the flame clean and free from degrading chemical combination in the first place. But, secondly—one might almost say simultaneously—it is intended to assist fusion. And, thirdly, in many cases, it is required to assist useful chemical combination so as to amplify thereby the metallic quality of the weld.

Here, then, clearly, is meat for experience, and for a hundred-and-one special considerations. For they all lead up to comprehension of the purpose of the third essential to good welding, the good because appropriate filling rod. And that purpose, briefly, is to give the metal of the weld, so far as you may, a little better quality than that of the surrounding metal.



For instance, in making a weld of sheet or "wrought" iron, or mild steels, one should use a rod of the very finest Swedish—or, better, South American—close-grained iron that can be had for money. And the very section of such a rod—any filler, in fact—is of the first importance, as the best is obviously the one that offers the least surface for oxidation during the melt. Or, again, for a copper weld, the rod (though otherwise of the purest grade of copper in its basic composition) should contain a little phosphorus—just enough to free the metal without letting it run at too low a heat, but not enough to take the natural stretch out of it or the subsequent weld—and just a trace of aluminum.

Then, again, there is the question of preparation. Pieces for repair—especially iron castings—need special stoving, just as much as a surgical patient needs an anæsthetic for a successful operation: and, equally, require a similar treatment for gradual cooling, much as the patient needs nursing back to consciousness. While still warm, too, the "nature" of the weld is greatly assisted to homogeneity with the rest by judicious light and constant hammering. In fact, a specially designed light pneumatic hammer would be an ideal tool for any shop in which much welding of mild steels is done. Yet one has to know exactly when to leave off hammering; which is, the moment that the steel begins to attract a magnet.

Further than these preparatory considerations, one comes at last to the execution of the job itself. The repair—or, indeed, any autogenous weld—must be regarded as a deep cut or wound that has got to heal by "first intention"—that is, from the bottom upwards to the surface. Therefore let the trench be fairly wide by filing a good bevel on the contiguous edges. Too narrow a trench means that the weld will either not, "go through," or if it does seem to do that, it may imprison oxidised particles—a whole stratum of them midway. So the job may look and finish well, yet really be internally rotten.

Too wide a trench, on the other hand, will probably lead to "adhesions," which means that although the melted metal seems to run in, and run freely, it sticks merely to the edges of the metal without incorporating itself with it. Such a weld, too often finishes well with a fine, ridgey seam, and comes down nicely under the "recovery" hammering. But if set in a vice and hit flatwise, it will suddenly bend, if it does not snap off like a rotten stick. Personally, therefore, I prefer a smaller trench, but formed on both sides if the nature of the job will allow.

Likewise—one is sorry to say we have not got very far—there

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

is such a thing as starting the job after all these preparations are made, so that when it is finished, there will be neither over-lapping, warping, or prolongation of one end beyond the other. Here comes in—even if the pieces be not otherwise secured, which is often a difficult and unsatisfactory business—the fine art of "tacking," or making four or more rapid intermediate joining melts, the middles before the ends.

Which done, there is the making of a nice gradual, pushing rather than chasing seam—slower in appearance, but wonderfully rapid in the rear—with the flame just far enough from the vertical to effect the push. There is also the art of oscillation as you go, still pushing; of curling and shaping up, with just an occasional, almost imperceptible pull-back to keep the heat in the weld just behind the fluid melt, to make sure of thorough incorporation. There is, at the same time, the deft management of the filling rod and the flux.

Again, there is the instantaneous occasional wipe of the blow-pipe nozzle—for which purpose there is nothing better than a soft leather or asbestos pad—and the detection of the need for that wipe, equally rapid. Likewise, simultaneously, to maintain the melt and keep the flame just so, without letting the metal splutter unduly. Also to overcome the awful fatigue of holding the featherweight of the blow-pipe just "there," and to keep running on.

You will thus be able to judge whether sound autogenous welding is just a matter of buying even a very good outfit and having a few weeks' practice—at a munitioneering factory, or whether it is not really the sole product of specialist experience. But don't be nervous: don't worry: go right on, and make up your mind to serve seven years for the Rachel of your craft. Then you may begin to know something about her. Until then, don't trust her. At any rate, not in any motor-car or aeroplane part that is subject to sudden stress or shock. That is where confidence—or self-credulity—means manslaughter.

DOPE.

By A. J. A. WALLACE BARR.

Five years ago, at the request of the Editor, I ventured to write a short article on "Dopes and Doping," and although in those days the present method of doping aeroplanes was only in its infancy, I am afraid there is very little which can now be added. The essential details remain the same, and now that I have been asked to amplify my remarks of five years ago, I feel a certain amount of diffidence in doing so in view of the large amount of scientific research and supervision which have been brought to bear in connection with this work. This causes a mere dope manufacturer like myself to feel that it is almost an impertinence to attempt to add anything to my previous remarks.

There is no doubt, however, that in the early days of doping sufficient attention was not given to the essential details which ensure success, and it is quite apparent that the A.I.D. have greatly improved the efficiency of doping by their supervision of dope shops. This supervision may perhaps have been irksome to contractors, but, taking it all round, it has greatly improved the conditions under which the doping is carried out, and has also prevented wastage of dope.

In the old days a contractor gave instructions that a certain number of coats to be applied, but he did not take sufficiently into consideration the human element which causes one doper to apply much thicker coats than another, with the result that very often the weight of deposit was far higher than was necessary. Under the existing doping schemes, only two ounces per square yard of dope deposit are necessary, and, in order to prevent wastage, great care should be taken to weigh the plane after each coat of dope, so that doping may be discontinued as soon as the requisite weight is obtained.

In connection with the weight of dope deposit, there is a paragraph in my previous article which is now incorrect, as it has been found that the weight of dope deposit on the fabric can be safely reduced. My previous article stated that the weight of doped fabric should be 100 per cent. greater than the weight of undoped fabric, but under the present conditions the specifications only call for an approximate increase of 50 per cent. when the fabric is doped, and a further 25 per cent. when the pigment covering is added.

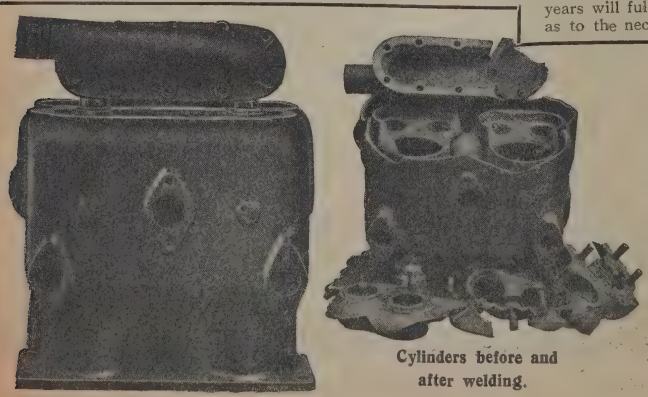
The pigment covering was referred to in the 1912 article, but it was not until the beginning of the war that this material began to be largely used, and in this respect credit must be given to the R.A.F. for producing an article which has proved satisfactory. The material in question is P.C.10, which solution has formed the basis of the pigmented coverings used in the different doping schemes.

The pigmented coverings serve a twofold purpose. They form an admirable protection for dope against light and other deleterious agents, and also reduce the visibility of the machine when viewed from above.

The main points to which great care should be given in the dope shop are the matters of temperature and ventilation. The temperature ought to be maintained at between 65/70 degrees Fahrenheit, and the atmosphere should be as dry as possible. Ventilation is still advisable and insisted on by the Home Office.

There is no doubt with the new ventilating system now in force the old type dopes containing tetrachlor-ethane, etc., could be used with perfect safety, and it is rather a pity that steps were not taken to improve the ventilation of the dope shops at an earlier date, so that the use of the old type dopes would be permitted, as undoubtedly these were far more efficient.

Before doping is commenced great care should be taken to see that the fabric is perfectly dry and free from any oils and fats. During the past few months trouble has been caused through the fabric containing spots of lubricating material used on the looms. This prevents the dope from drying properly, and it is very difficult to get this fatty matter out of the fabric. Great care should be taken to rub the first coat of dope well into the fabric, so that both sides are thoroughly impregnated, and subsequent coats should be laid on as evenly as possible, until the requisite weight of two ounces per square yard is obtained.



With regard to the question of the number of coats which should be applied and the thickness of each application, this is a point that has caused a considerable discussion, and I venture to suggest that more efficient results are obtained when several coats are applied very thinly, and although this may appear to reduce the output, it is important to remember that the final efficiency of the machine and its weathering capabilities are the objects in view.

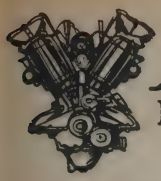
With regard to the utensils used in the dope shop, it should be mentioned that a painter's wide-mouthed can is certainly not suitable for volatile solutions like dope, as a large area is exposed for evaporation, and the material rapidly concentrates and gives unsatisfactory results. I might also mention that aeroplane builders suffer a considerable loss during the course of the year through materials being allowed to remain in these cans over night, instead of being emptied back into drums. If materials are allowed to stand in open cans during the night, they are unsuitable for use the next morning and have to be scrapped.

Clean utensils are essential for satisfactory doping, and every care should be taken to see that the drums containing dope, etc., are screwed up as soon as a supply has been withdrawn. This will prevent evaporation, and ensure the material remaining in good condition.

With the coloured and pigmented materials great care should be taken to stir these before use.

I feel sure the A.I.D., with their experience over the last few years will fully bear me out as to the last few remarks, specially as to the necessity for cleanliness and prevention of evaporation.

Cylinders before and after welding.



SCIENTIFIC WELDING.

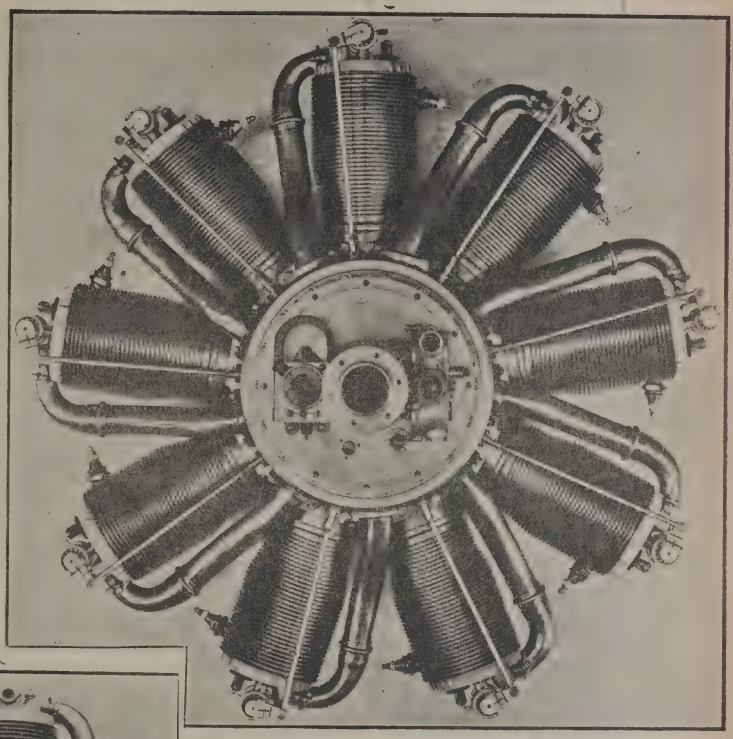
The accompanying photographs show a particularly bad smash which the Barimar Welding Experts, of 10, Portland Street, London, W., have been able to make good.

Figure 1 depicts a pair of cylinders with combustion heads blown completely out, and smashed water-jacket and water-plate.

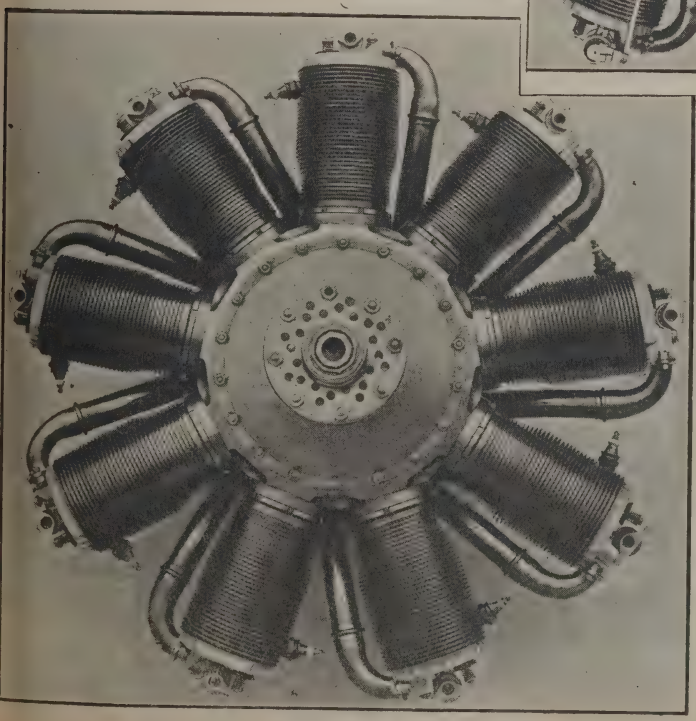
Figure 2 shows a photograph of the whole heap of ruins reconstituted, machined and cleaned, and made in every respect practically as good as new.

It seems clear that no metal part however large or badly fractured should be scrapped until it has been examined by a firm of welders which really knows its job.

AERO-MOTORS



IN KIND AND CONSTRUCTION



By Geoffrey de Holden-Stone

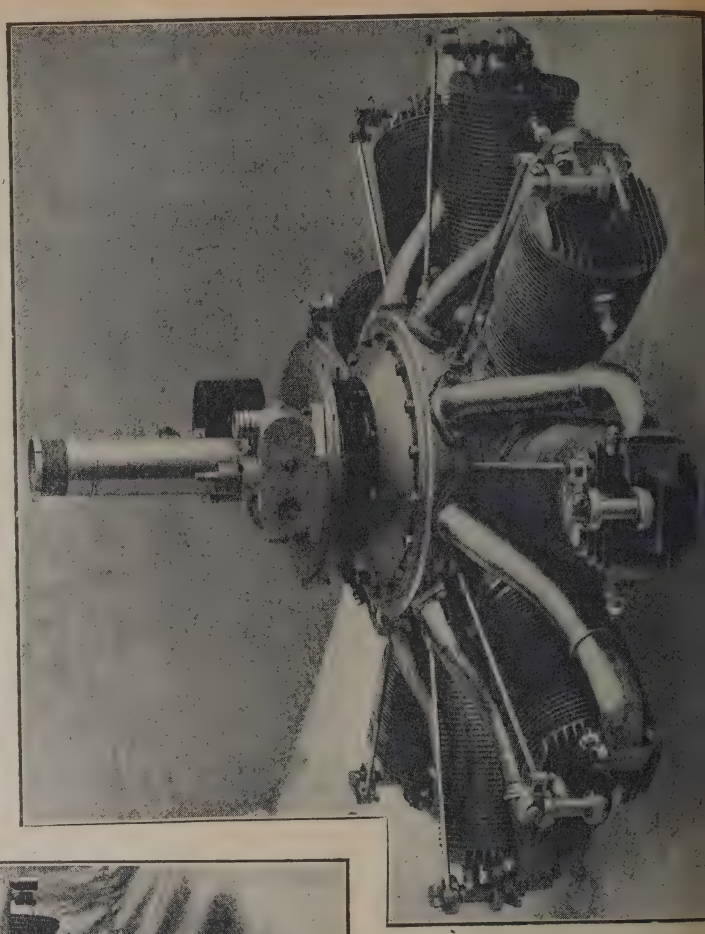
On this and following pages appear excellent illustrations of the two probably best-known rotary aeromotors, the Le Rhône and the Clérget: both, since the war, of British manufacture. Development—which is not always the same thing as design—moves so fast nowadays; and where possible to pile the mechanical Pelion upon Ossa, to such powers, that even these, as models, have become almost classic in a brief three years. Still—as anyone with the least idea of the number to which both are being manufactured would agree—it seems evident that they have not been improved upon, as types of their kind. Both were extensively dealt with in these columns from eighteen months to two years ago, when, so many having joined up with the Flying Services with no better qualification than their Country's need, it became necessary to discuss whys and wherefores of design as some helpful basis of maintenance, to a greater extent than the usual specification—the summit of descriptive concealment—manages to afford.

In those days, and since, gladly I did what little some twenty-five years' practical specialised study of these matters, a qualifying degree or so, and personal touch with the technical developments in five countries enabled me to do. Even then—so fast does knowledge come, if wisdom lingers—I occasionally found I did not know so much as the youngest. Still, I took courage, n the appreciation of the majority

The 110-h.p. Le Rhône (Back View).

The 110-h.p. Le Rhône (showing Propeller end).

who shared my ignorance, to continue. But those days are past. Probably many of my then readers have perished doing their duty behind the machines we studied together. So many, indeed, that a new and possibly more compulsory call than they ever needed has arisen for others to take their place. Doubtless among the rest, to those whose belated apprenticeship to engineering began in August 1914. Their experience as machine-minders on repetition work would, of course, be of the greatest value in the R.F.C. and R.N.A.S.: so—as our correspondence proves—they no doubt constitute a new set of readers. After all, they are "the practical men, working among these machines, so their opinion counts most": as my Editor, better assured of their technical qualifications and accuracy than of mine, is careful to tell me when they write up to contradict flatly anything I happen to have written the week before. This being so, one is certain of their interest in seeing the bits and pieces which they have watched grow into being, in the altogether. Otherwise they know all about them. So I need not waste their time or mine with more than the briefest once-over specification of what part goes where in either case. Then I can hardly go wrong.



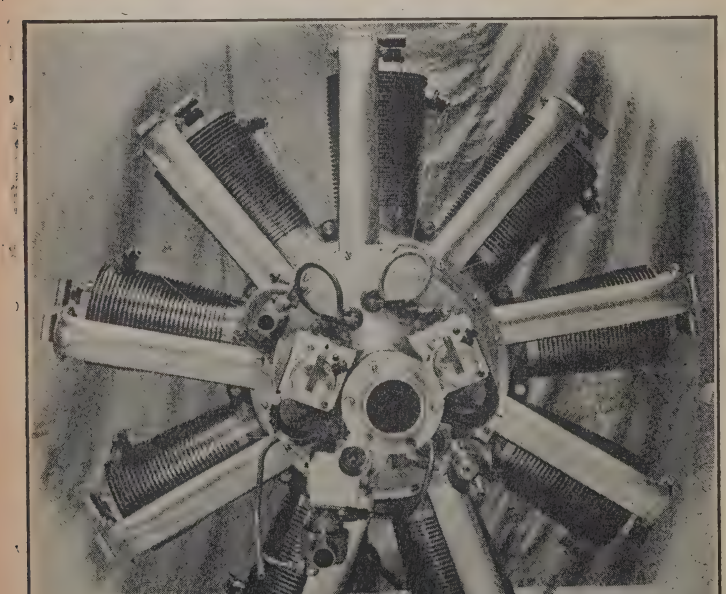
Unfortunately, Anno Domini—and the opinions of several ostensibly qualified medical men during the last three years—

exempts me, too, from everything; even being cocksure about anything. Otherwise I would say I am sure they could find no better models to study critically. I have seen no sign that any of them will design anything better. Still, if they know a better, let them go to it.

To begin with the—I believe—older Le Rhône, made in Paris by the Société des Moteurs Gnôme et Rhône, 3, Rue la Boétie: here by the Gnôme and Le Rhône Engine Co., Ltd., 47, Victoria St., S.W.: in Italy by La Societa Italiana Motori Gnôme è Rhône, of 73, Strada Veneria, Madonna di Compagna: and in America by the General Vehicle Co., of Long Island City. Thus introduced, we see on this page the 9-cylinder model rated at 110 h.p. at 1,200 r.p.m. on a piston-sweep of 105 mm. by 140 mm.; albeit, it has given as much as 130 h.p. Here, to show the progress of the last three years, be it noted that the 18-cylindered Gnôme of 1914 only gave another 30 h.p.

Like the Gnôme, however, it gets its induction from the crank-chamber, but externally in the more or less conventional four-stroke manner of reversed gas-flow, whereas the Gnôme, both old pattern and monosoupape, are uniflow, and therein unique in their cycle. It will be seen that for each cylinder a single push-and-pull tappet rod operates both inlet and exhaust by a rocket with a ball-borne sleeve-mounting.

Internally, the valve gear, operating all these rods consecutively, consists of a single cam-plate with two cam-ramps—also plate-like—bolted to its channelled edge—with as many cam formations on each as there are rods. Each cam-ramp operates one set of arms of bell-cranks, to one of which sets the rods are pinned. The cam-plate itself—ball-race-borne—is mounted on a slightly eccentric prolongation of the crank-shaft, and is operated by an internally toothed ring-gear bolted to



The 110-h.p. Le Rhône (showing Inl Pipes and Cylinder Heads).

it, which is engaged by a spur-ge mounted solid on a further prolongatic of the shaft; *concentric*, however, to t shaft axis. This last gear is, of cours eccentric relatively to the toothed ring so the rotation of the motor-mass gives the complete motion of an eccentric and the same time rotary spinning throw—one twirls a curtain ring on the finger but in the opposite direction to the motor rotation, at ¼ of the latter's speed.

The connecting rods are attached rectangular feet, inserted between t steps of the internally stepped halves of drum, carried on ball bearings on t crank-pin. All except the seventh—ninth—master rod, which is bolted dow to the halves of the drum to unite ther As neither drum, nor rods, nor pisto reciprocate, but merely rotate end-long this construction is strong enough to ser all purposes with no risk of those lock-t bolts working loose.

For the rest the motor-mass is carri in the typical way, on crank-chamber b bearings behind, in the first place; a secondly by a double thrust bearing and fourth ball bearing on the main shank the shaft supporting the whole. Th shank is hollow, and serves as an indu tion trunk from the carburettor. This or was, a Tampier, automatic, and need controlled as to the petrol supply; air su

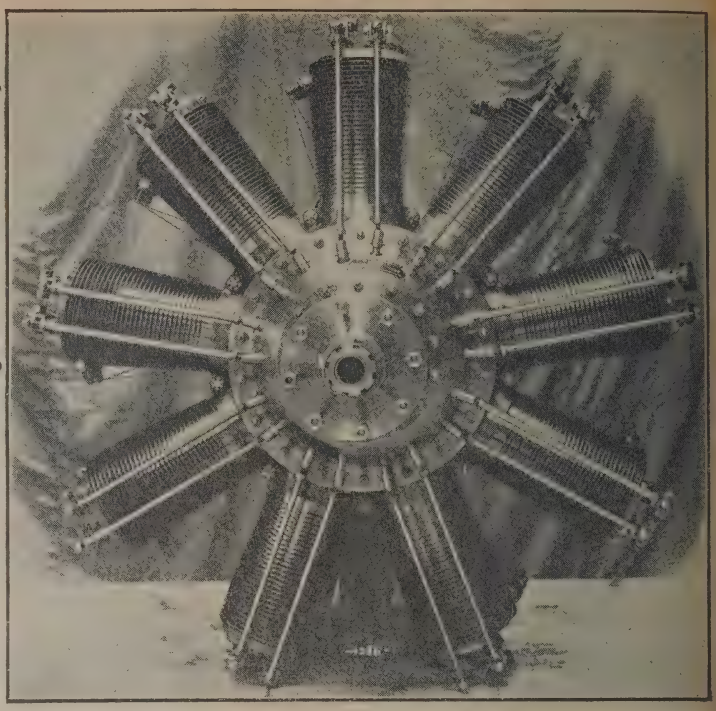
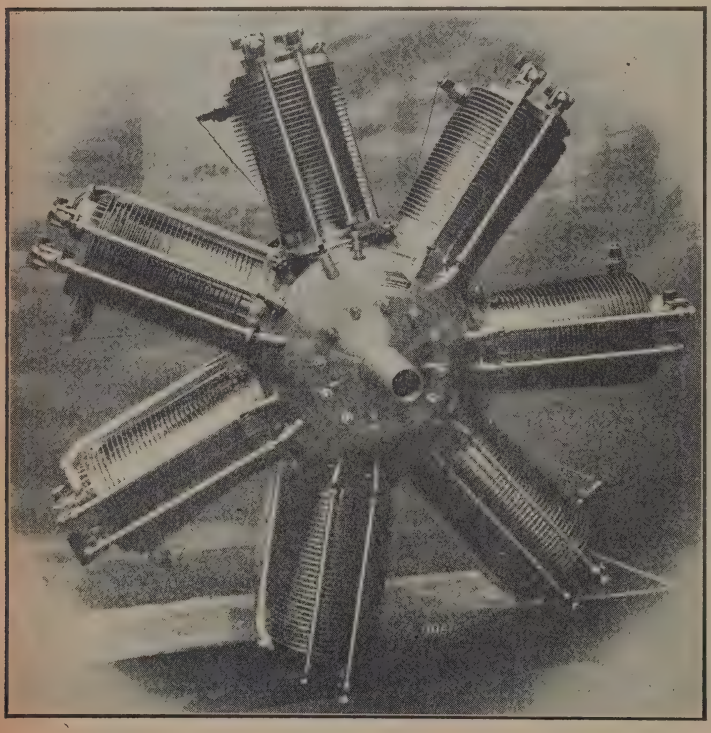
ply and mixture being controlled by a guillotine-type throttle.



The shaft-shank also serves as a conduit for the lubrication pipes—but not for the oil itself—which lead to a collector-ring within the main ball bearing. From this point the oil runs through leads in the crank-webs to all other bearings, and from the bottom of these webs through quill-like tubes to each cylinder-wall in turn.

The ignition—from two H.T. magnetos as shown—runs to the usual stationary plate and contact plug, which makes contact with the segments on the rotating distributor in the usual way.



THE CLERGET.

While, of course, working in the same way, and of much the same mass construction, the detailed design of the Clêrget motors is entirely different from the Le Rhône. The carburettor is not a constant level-type, but has a rotary throttle controlling air, mixture and petrol supply, the last by moving a special spray-piece up and down the jet proper. The ignition is distributed much in the same way: one contact-plug for each magneto.

But the connecting rods are all of the same length, and pinned into the halves of a drum exactly in the Salmson manner. The cylinders are likewise flat-topped but wider, and each valve is opened by a separate tappet rod: all the rods being on the front side, opposite the flat induction pipes at the back. The valve-gear motion is entirely different, to operate these rods. Not only is it the converse of the Le Rhône scheme, but the parts involved are of different design: these being a three-armed star-cam, mounted *eccentrically* on an extension of the crank-shaft—which is concentric, nevertheless, to the axis of the latter—but free to rotate; and so giving the same kind of spinning throw to an internally ramped cam-plate—ramped in alternate lifts and hollows—into the hollows of which the tappet rods are projected. Thus, as the motor rotates the arms of the star-cam alternately lift the entire plate on the cam-lifts or drop into the intermediate hollows to lift the tappets. In other words the star-cam has a relatively epicycloidal movement as to the crown or cam-plate. So much, then, as to how the Le Rhône and Clêrget motors respectively work. Remains only to say that the latter's cylinder measurements are 120 mm. by 150 mm.: the weight of the 7-cylinder model being 234 lbs. and that of the latter 395 lbs.: overall measurements in the one case being 920 mm. by 810 mm. and in the other 1,020 mm. and 1,160 mm. Otherwise we have seen how both models are shaped in mass and detail, and where they differ. With not a word of why, to disturb the brain of the wisest and youngest of ex-machinists; the future democracy of aviation, to whom my salutations of the most—distinguished.

The 130-h.p. Clêrget-Gwynne (Front View showing Valve Rods).

The 90-h.p. Clêrget-Gwynne (7-Cylinder Type).

One may add that the Clêrget is the product of Mm. Clêrget, Blin et Cie, 37, Rue Cavé, Levallois, Seine, and that the proprietors of the British rights, and also the leading manufacturers, are the famous engineering firm of Gwynnes Ltd., Hammersmith Iron Works, London, W., who have produced engines which surpass in performance their French-built prototypes.

(To be continued.)

A RECTIFICATION.

Owing to an error in transcription the statement appeared in THE AEROPLANE recently that the 8-ply bullet-proof Triplex panels for armoured cars are 5 ins. thick. These panels are, in fact, only 2 15/16 ins. thick.

When one considers that this thickness of Triplex stood the impact of a Mauser bullet at 25 yards in both directions, one begins to appreciate the astonishing resistance of the material. Its resisting power is vouched for by an official letter from the Trench Warfare Research Department.

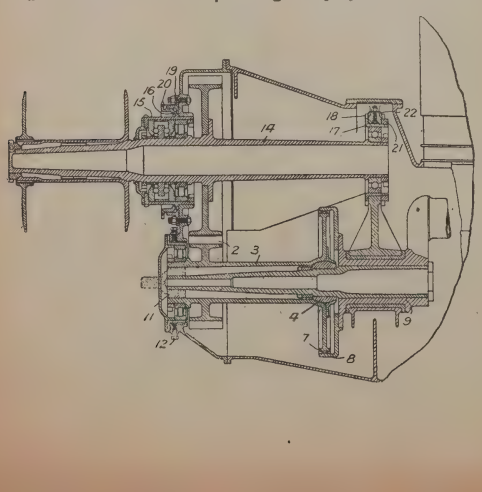
THE PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by The Aeroplane from the current Official Patents Records.

Patent Applications.

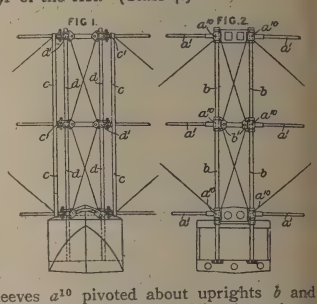
Abrahams, E. G. Balloons and airships. No. 11095. August 1st.
Back, W. E. Flying machines. No. 11113. August 2nd.
Back, W. E. Control of flying machines. No. 11172. August 2nd.
Baker, T. Y. Sighting device for use in aircraft. No. 11018. July 31st.
Blackburn Aeroplane and Motor Co. Pulleys for control of flexible connections of aircraft, etc. No. 11008. July 31st.
Blackburn Aeroplane and Motor Co. Aeroplane flying machines. No. 11009. July 31st.
Blackburn Aeroplane and Motor Co. Hoisting or lifting gear for aircraft. No. 11147. August 2nd.
Blackburn Aeroplane and Motor Co. Method of construction of boats or floats. No. 11215. August 3rd.
Bramble, Y. Observation balloon and fittings. No. 11248. August 3rd.
Brock, A. Aerial photography. No. 11265. August 3rd.
Bryce, J. A. Wings or planes of aeroplanes. No. 11094. August 1st.
Chester, W. E. Method of manufacture of propellers. No. 11055. August 1st.
Chester, W. E. Landing gear for aircraft. No. 11056. August 1st.
Dodson, E. Altitude control for carburettors. No. 11301. August 4th.
Firth, B. Aeroplanes. No. 11137. August 2nd.
Genner, L. J. E. Safety belt for use on aeroplanes. No. 11232. August 3rd.
Gledhill, A. H. Apparatus for releasing bodies from aircraft. No. 11175. August 2nd.
Hall, W. R. Fastener for wires of aircraft. No. 11047. July 31st.
Newbold, H. Goggles for airmen, motorists and others. No. 11164. August 2nd.
Newman, T. F. Substitute for canvas and fabric used in construction of aircraft. No. 11173. August 2nd.
Newman, T. F. Composition and method of replacing wood in construction of aircraft. No. 11174. August 2nd.
Sage and Co., F. Aircraft. No. 11096. August 1st.
Shortt, A. G. Method of keeping nose of airship or kite-balloon convex against wind pressure. No. 10918. July 30th.
Wood, W. H. Manufacture of propellers, etc., of aircraft. No. 10969. July 30th.



Complete Specifications Accepted, prints of which are obtainable on and after August 23rd, 1917.

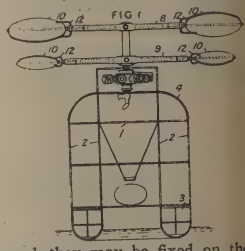
108,232. Sept. 19th, 1916. Reynolds, A. J. Searchlight in combination with gun for use against aircraft.
108,245. Oct. 17th, 1916. Wilson, W. A. Ordnance for land, aerial and marine purposes.
108,259. Nov. 23rd, 1916. Rooney, J. Airships.

Abridgments of recently published Specifications.



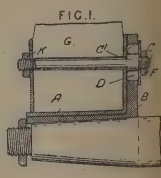
106,794. Toothed Gearing. Royce, F. H., and Rolls-Royce, Ltd., Nightingale Road, Derby.

In toothed reduction gearing for use on aeroplanes, with turbines, etc., a toothed wheel 2 is formed on or secured to a hollow shaft 3 which is connected to the engine crank or other driving shaft 9 by a universal joint comprising a spherical bush 4 and toothed inter-engaging parts 7,8. The wheel 2 gears with a toothed wheel on the shaft 14 driving the propeller, etc. Shafts 3, 14 are both carried in adjustable roller bearings. To ensure exact alignment of the shafts 9, 3, the bearing of the shaft 3 is adjusted by radial screws 12 until a gauge-piece 11 can be freely inserted between the shaft 3 and an extension 5 of the shaft 9. The shaft 14 is adjusted by the use of eccentric bearing-housings 15, 17 provided with serrations 16, 18 so marked that the housings may be equally rotated. The housing 15 may be locked by a serrated ring 19 and retained by a nut 20; a serrated nut 21 engages the housing 17, a locking-plate 22 being provided.



106,818. Aeronautics. Levy, L. G., 19, Avenue de la Grande-Armee, Paris. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act. (Class 4.)

Planes, arrangement of.—Multiplane aeroplanes and hydro-aeroplanes having planes adapted to be turned back about a rear vertical strut for transport have auxiliary front struts on the movable portions adapted to engage corresponding fixed struts when in operative position. Figs. 1 and 2 show portions of a triplane in which the rear spars a^1 of the wings have sleeves a^{10} pivoted about uprights b and between forked brackets b^1 braced as shown. The front inner ends of the planes are connected by uprights c having eyes c^1 adapted to be pinned to shackles d^1 on uprights d on the car or hull. The planes are stayed by wires to a single turnbuckle-fitting arranged transversely at the forward part of the hull. The wires for controlling the ailerons may be led around pulleys just behind the uprights b, so that the wires need not be disconnected when the wings are folded.



106,888. Aeronautics. Porter, J. R., 9, Gray's Inn Square, London.

Aerial Machines without Aerostats; Propelling; Cars.—A helicopter is supported by two oppositely rotating propellers 8, 9, the propeller 9 being mounted upon an annular wheel, and the propeller 8 upon a part carrying the planet wheels of an epicyclic gear of which the sun pinion is driven by the engine. The propellers have each four arms provided with blades 10 which may pivot about their centres of pressure within the limits of stops 12 so as to assume an angle for helical gliding should the engine stop. When circular blades are used they may be fixed on the arms. The upper propeller is larger than the lower one. The machine is supported upon a light frame 1, 2 having an annular float 3 and a suspended seat 4. Horizontal motion is induced by a weight sliding on a rod.

106,944. Screw-propellers. Bradshaw, G. E., A.B.C. Works, Hersham, Walton-on-Thames, Surrey.

The wooden blade G is secured to an intermediate loose boss A by means of a bolt C, the head C^1 of which is deeper than the fixed boss B and is surrounded by a resilient buffer D of sufficient thickness to prevent the stresses, when the nuts F, K are screwed up, from falling on the boss B.

A USEFUL HAND-BOOK.

The management of A. V. Roe and Co., Ltd., have published the second edition of a book produced in 1915 called "Erecting and Aligning 80 h.p. Avro Biplanes, Type 504."

Although this book deals specifically with the adjustment of this particular machine, the system set forth may, of course, be employed with any normal type of tractor biplane, and it is, therefore, of very general interest.

The volume has been entirely re-written, to bring it in line with up-to-date knowledge, and there will doubtless be a considerable demand for copies, not only from those engaged in the Flying Services, but from those in the Aircraft Industry, who are anxious to learn something of their craft.

Ease of reference has been kept in view throughout; accordingly, the book has been divided into seven stages, each stage being taken in its order. The stages are each divided into sec

The "Guardian Angel" Parachutes

TRADE MARK
(REGISTERED)

For Life-saving uses on the Training Grounds; and for special Naval and Military operations.
Open automatically, and dropped from Aeroplanes, always carry their man within 2½ seconds.
Open instantaneously, and bring their man safely to the ground from any height above 200 feet.
All the Airman has to do is to jump overboard, everything else is done for him automatically.
Pilots can in the last resort charge enemy Aeroplanes with every prospect of their own safety.
Non-spinning Shock-Absorber Slings, taking all shocks off the Parachutist and Parachute.
Aviator's Harness, to carry safely a wounded or insensible man. Instant release on landing.
Standardised in every detail, air and waterproof, they can be carried continuously for six months.
These Parachutes are under static and kinetic control in all the phases of their action.
There is no possibility of the entanglement of their rigging in the fiercest air current.
These Parachutes can be dropped with absolute safety from Aeroplanes flying at any speed.
These Parachutes reduce free-fall to its minimum, thus preserving the Airman's nerves.
Adapted for use with every type of Aircraft: Kite and Free Balloons, Airships and Aeroplanes.
Special adaptations made for special purposes: they are adaptable to every kind of purpose.
These Parachutes are sealed to prevent tampering: the seals are broken only in the act of usage.

RELIABILITY—First. RELIABILITY—Second. RELIABILITY—All the Time.

E. R. CALTHROP'S AERIAL PATENTS LTD.

ELDON STREET HOUSE, ELDON STREET, LONDON, E.C.2.

Telephones (2 lines): London Wall 3266 and 3267. Telegraphic Address: "Savemalivo-Ave-London."

VARNISHES . . . for AEROPLANES

(SUBJECT TO A.I.D. INSPECTION)

AIRSCREWS, SPARS, STRUTS, STAYS, ETC.

ROBT. INGHAM CLARK & CO. LTD.

Offices: CAXTON HOUSE, LONDON, S.W.1. *'Phone: Victoria 2923*
Works: WEST HAM ABBEY, LONDON, E.15. *Phones: East 955, 966*

tions, describing the adjustment of the machine in front view, side view, and plan view, and each section is again sub-divided under "Enunciation," "Method," "Check," and "Appliances."

Under "Enunciation," is the adjustment required to be done.

Under "Method," is the method of obtaining this adjustment.

Under "Check," a suitable measurement is given, when possible, to be used as a check on the true adjustment.

Under "Appliances" is a description of any appliances required when aligning the machine.

In addition, the book contains some most useful tables, including tables of combination strength, showing the sizes of turnbuckles, shackles, etc., which are properly used with the different Admiralty, R.A.F., Bullivant, Brunton, and Cradock cables.

The whole booklet is illustrated with clear and well-drawn diagrams, and the best tribute that can be paid to its usefulness is to say that one wished that such a work existed in connection with every type of aeroplane in use.

The price of 1s. 6d., which is all that is charged for the book, is purely nominal when its value is considered.

Applications for copies should be addressed to A. V. Roe and Co., Ltd, Newton Heath, Manchester.

PISTON RINGS AND OBTURATORS.

A correspondent writes:—

In quite a recent book on "Aeronautical Engines," a statement was made which, in view of recent developments, should not remain unchallenged.

The author of the book may not be alone in the opinion he expresses, namely, that the friction loss due to obturators is excessive, and greater than that due to piston rings; but it is not based on any tests, and no reasons were given therefor. A superficial consideration of the subject might lead one to the conclusion that the friction was enormous, as the obturator is pressed by the force of the explosion against the walls of the cylinder. While the latter is perfectly true, although this pressure can be regulated, a further consideration will show that in spite of this pressure the friction losses are not high.

Firstly, the obturator is only subject to pressure during a small portion of the cycle; and, secondly, during this portion of the cycle the piston movement is small. Hence, from theoretical considerations it would be anticipated that the friction loss of one obturator is negligible as compared with several piston rings, which have to exert a considerable pressure per square inch for the whole of the cycle.

That the aforesaid statements are correct is absolutely proved by the insignificant wear of an obturator ring, even though made of relatively soft material.

MARKET REPORTS.

Prices given are for quantities on usual terms.

August 8th, 1917.

COPPER.—Owing to August Holidays, no current prices are available, and there has not been any change reported. The situation in U.S.A. is still far from satisfactory, and it is only the fact that colossal stocks are held by refiners, which has kept prices at moderate level. As stated previously, it is the unanimous opinion of eminent authorities that the closing of the only free market in the world has given the American firms the whip-hand. There does not appear to be any reason whatever why certain restrictions should not be removed, there are ample supplies of Copper, and if the Government would only relax their hand the situation might be saved.

Comparative Prices.

Standard Copper, August 10th, 1917	£125	Cash.
,, August 3rd, 1917	£125	Cash.
,, July 3rd, 1917.....	£130	Cash.
,, Two years ago	£72 10s.	Cash.
Copper Sheets	£160	per ton.
Copper Tubes S.D.	19¾d.	per lb.
Brass Sheets 24 Gauge	15⅝d.	per lb.
Brass Tubes S.D.	16½d.	per lb.

TIN.—The market is very firm, and business has been more brisk, as anticipated in our previous reports, American buyers are coming into the market, and the demand from this quarter is bound to increase. Commencing September 1st next, Smelters' terms will be nett instead of less 2½ per cent. as heretofore.

The Ministry of Munitions have imposed further restrictions upon tinplate firms, maximum basis prices for tinplates and terne plates having been fixed; this has disorganised business a little, furthermore, in April, unrestricted sale of certain sizes was permitted, but stocks now held can, until August 31st, be sold for Home trade only, after that date the concession is withdrawn.

Comparative Prices.

August 10th, 1917	£247	0 0
August 3rd, 1917	£247	0 0
July, 1917	£242	15 0
July, 1915	£156	15 0
Highest Price, 1916	£205	0 0

LEAD.—Official Prices are still unaltered, and supplies for national needs are quite adequate. It is expected that the U.S.A. Government will take action in regard to prices there, and, in consequence, business is dull.

Comparative Average Prices.

August 10th, 1917	£30	0 0 (Official).
Last Year	£28	2 6 ,,
1915	£23	12 0 ,,
Highest Price, 1916	£36	10 0 ,,

STEEL.—A great many firms are closed this week, the long holiday being required chiefly by firms to enable them to have a careful stocktaking, so that they can comply with the increasing Government regulations. It is now practically impossible for supplies to be obtained for any other purpose than direct War Work. We understand that the Ministry have issued further instructions to Steel Makers, and it is not surprising to learn that they are framed in such a way that the firms find it impossible to conform to them.

The recent regulations will nearly put an end to merchants and stock-holders, for while large factories invariably dealt direct with the mills, the small firms with orders for small quantities of assorted sizes usually dealt with the merchants. One considers it is false economy to insist upon makers accepting such trifling orders direct. Why not allow the stockholders to put through their orders for large quantities of the sizes for which they have comparatively small but invariably urgent demands? The small consumer, and, occasionally, large factories, with urgent demands, would be assisted and an economy in production effected.

Tremendous efforts are still in progress for a colossal increase in the output of all classes of Steels, and the results, when the mills closed down for holidays was fairly gratifying. Prices remain unaltered.

Current Average Prices.

R.A.F. 3B Steel (Black or Blued Reeled), 36s. to 40s. per cwt.
R.A.F. 1E Steel (Black or Blued Reeled), 78s. to 80s. Basis.
R.A.F. 9A Sheet Steel, 30s. to 32s. per cwt.

ALUMINIUM.—The position remains unaltered.

Official Prices.

Ingot	£225 per ton.
Re-melted	£210 per ton.

TIMBER.—The question of Timber supplies is still very serious, and remains unsolved.

Further to the comments in last week's report on the Admiralty timber stocks, one gives below a few interesting questions which were recently asked in the House of Commons:—

Sir H. Dalziel asked the Minister of Munitions whether he is aware that large manufacturers of aeroplanes in Great Britain absolutely refuse to use any of the Government's stock of silver spruce on the ground that it is for the most part rubbish; whether he is aware that only a few days ago a parcel of silver spruce from Government stocks was examined by the foreman of a big Midland aeroplane builder, of which only 20 per cent. was found suitable, and the balance was returned; and can he say who is responsible for passing inferior wood?

Sir W. Evans: The answer to the first part of the question is in the negative. It is true that a large proportion of a parcel of silver spruce from Government stock was found unsuitable, and that the balance was returned. This was due to the fact that the timber was dispatched before the present system of inspection was instituted.

Sir H. Dalziel: Who was responsible for passing it?

Sir W. Evans: I will inquire.

Mr. Shirley Benn: Was the order given by the Ministry of Munitions, the Admiralty, or Mr. Meyer?

Sir W. Evans: I will have inquiries made.

Mr. Watt: Did not the hon. gentleman say that this was in excellent condition?

Sir W. Evans: I must refer the hon. member to my answer.

Mahogany is becoming increasingly difficult to procure, and the price is stiffening.

Walnut is practically unprocurable.

Current Average Prices.

Silver Spruce, 17s. 6d., c.f.
English Ash, 13s. 6d. to 15s., c.f.
Walnut, 2s. 3d. to 2s. 6d., s.f.
Mahogany, 2s. 2d. to 2s. 4d., s.f.

FABRIC.—There are good supplies of Fabric and Tapes. In view of the uncertainty of the official prices we give below the prices quoted by the Mills.

17C Fabric 36 in. wide	2s. 5½d. per yard.
17C Fabric 38 in. wide	2s. 7d. per yard.
17C Fabric 42 in. wide	2s. 10½d. per yard.
17C Fabric 54 in. wide	3s. 8¼d. per yard.
Spaced Fabric 37⅓ in. wide	1s. 7⅛d. per yard.

(*Continued from page 438B.*)

our artillery. Many photographs were taken by us, and four hostile aerodromes were heavily bombed during the day..

Enemy aircraft were again particularly aggressive. In air fighting nine German aeroplanes were brought down, two of which fell within our lines, and eight other hostile machines were driven down out of control.

Seven of our machines are missing.

* * *

WAR OFFICE COMMUNIQUÉ.

AUGUST 10th.—The G.O.C. the British Forces in Macedonia reports :—

On the night of August 4th-5th the aerodrome at Livanovo (in the Upper Struma Valley, north-east of Petritch) was successfully bombed by our aeroplanes.

* * *

HOME COMMAND COMMUNIQUÉS.

AUGUST 12th, 7.20 p.m.—At about 5.15 p.m. this afternoon a squadron of about 20 enemy aeroplanes were reported off Felixstowe.

They skirted the coast to Clacton, where they apparently divided, part going south towards Margate.

The remainder crossed the coast and went south-west towards Wickford (a village 8 miles south-south-east of Chelmsford), near which place they turned south-east, and dropped bombs in the neighbourhood of Southend.

Some bombs were also dropped at Margate.

No reports of damage or casualties have yet been received.

Our own aircraft were very quickly in the air and pursued the enemy out to sea.

11 p.m.—The enemy raiders did considerable damage at Southend, where they dropped about 40 bombs.

The casualties so far reported are : Killed, 8 men, 9 women, 6 children ; and about 50 people injured.

At Rochford (three miles north of Southend) two men were injured, but no damage so far reported.

At Margate four bombs were dropped, and one uninhabited house was demolished, but no casualties occurred.

THE CASUALTY LIST.

Reported August 8th.

KILLED.—Fitzgerald, Sec. Lt. W. W., R.F.C.
Lovell, Sec. Lt. W. L., R.W. Kent R., attd. R.F.C.
Rayner, Sec. Lt. N. R., W. Yorks. R., attd. R.F.C.
Rodocanachi, Sec. Lt. P. J., R.F.C.

PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—Severs, Sec. Lt. A. G., R.F.C.
Sharpe, Sec. Lt. M., R.F.C.
Thomas, Lt. M. W., R.F.A., attd. R.F.C.
Topham, Sec. Lt. M., R.F.C.

DIED OF WOUNDS.—Hope, Sec. Lt. H. A., R.F.C.

PREVIOUSLY REPORTED MISSING, NOW REPORTED DIED OF WOUNDS.—Lowery, Capt. A. M., R.F.C.
Swann, Lt. G. W., A.S.C., attd. R.F.C.

WOUNDED.—Blencowe, Sec. Lt. F. P., S. Staff. R., attd. R.F.C.
Britton, Lt. A. F., M.G.C., attd. R.F.C.
Burkett, Sec. Lt. G. T. W., R.F.C.
Cassels, Sec. Lt. J. S., M.C., R. Suss. R., attd. R.F.C.
Clayton, Sec. Lt. O., R.F.C.
Cresswell, Sec. Lt. H., R.F.C.
Foden, Sec. Lt. J. C., R.F.C.
Hughes-Chamberlain, Lt. J. L. M. de C., Suff. R., attd. R.F.C.
Kennard, Sec. Lt. W. D., Lond. R. and R.F.C.
Lewis, Sec. Lt. T. A. M. S., R.F.C.
Luke, Sec. Lt. T. C., M.C., R.E., attd. R.F.C.
Marsden, Sec. Lt. C. C., R.F.C.
Roy, Sec. Lt. H. St. C., M.C., R. Innis. Fus., attd. R.F.C.
Turner, Sec. Lt. A. E., M.C., R. War. R., attd. R.F.C.
Watt, Sec. Lt. N. L., Cav. Spec. Res., attd. R.F.C.
Willis, Sec. Lt. G. R., S. Lan., attd. R.F.C.

MISSING.—Beatty, Sec. Lt. B. C., R.F.C.
Campbell, Sec. Lt. J. K., R.F.C.
Chapman, Sec. Lt. J., High. L.I., attd. R.F.C.
Hine, Sec. Lt. J. B., R.F.C.
Hume, Sec. Lt. R. C., R.F.C.
McPherson, Sec. Lt. L. A., R.F.C.
Ottey, Sec. Lt. R. G., Leic. R., attd. R.F.C.
Roskelly, Lt. W. M., R.F.C.
Smith, Sec. Lt. J. C., R. War. R., attd. R.F.C.
Walker, Lt. G. H., S. Lan. R., attd. R.F.C.
Wilkins, Capt. H. O. D., Bedf. R., attd. R.F.C.
White, Sec. Lt. T. W., R.F.C.

Reported August 9th.

KILLED.—Corran, Maj. O. M., R. Lanc. R., attd. R.F.C.
Mitton, Lt. H., R.F.A., attd. R.F.C.
Pizey, Lt. N. M., Yeo. and R.F.C.

DIED OF WOUNDS.—Airth, Lt. R. A., Bedf. R., attd. R.F.C.

WOUNDED.—Goldie, Sec. Lt. G. N., R.F.C.
McCall, Lt. M., R. Scots Fus. and R.F.C.

MISSING.—Corbishley, Sec. Lt. R. H., Devon R., attd. R.F.C.
Gunner, Sec. Lt. W. H., M.C., R.F.C.
McDonald, Lt. H. O., R.F.C.
Minot, Capt. L., R.F.C.
Rickards, Lt. H. W. B., R.F.A., attd. R.F.C.

PREVIOUSLY REPORTED PRISONER, NOW REPORTED WOUNDED AND PRISONER IN GERMAN HANDS.—Furniss, Sec. Lt. K. R., Yeo. and R.F.C.

CORRECTION.—Bond, Lt. W. A., M.C., K.O.Y.L.I., attd. R.F.C. (reported missing), should read—Bond, Capt. W. A., M.C., K.O.Y.L.I., attd. R.F.C.

CANADIAN CONTINGENT.—MISSING.—MacKay, Lt. W. B., Cent. Ont. Regt., attd. R.F.C.

PREVIOUSLY REPORTED KILLED, NOW REPORTED DIED AS PRISONER IN GERMAN HANDS.—Masson, Lt. R. G., E. Ont. Regt., attd. R.F.C.

Reported August 10th.

KILLED.—Walter, Lt. S. R. P., R. W. Surr. R., attd. R.F.C.

DIED OF WOUNDS.—Smith, Capt. G. C., M.C., A.S.C., attd. R.F.C.

WOUNDED.—Collier. Sec. Lt., Som. L.I., attd. R.F.C.
Gordon, Sec. Lt. A. W., R.F.C.
Harrison, Sec. Lt. C. J. L., Worc. R. and R.F.C.
Lascelles, Capt. G. A., R.F.C.
Roberts, Lt. V. C., Northd. Fus., attd. R.F.C.
Snowden, Lt. H. J., S. Lan. R., attd. R.F.C.

MISSING.—Best, Lt. F. B., A.S.C. and R.F.C.
Buxton, Sec. Lt. G. B., Norf. R. and R.F.C.

PREVIOUSLY REPORTED MISSING, NOW REPORTED PRISONERS IN GERMAN HANDS.—Bacon, Sec. Lt. L. G., R.F.C.
Spearpoint, Sec. Lt. H. G., R.F.C.

Reported August 11th.

DIED OF WOUNDS.—O'Beirne, Sec. Lt. A. J. L., Yeo. and R.F.C.

WOUNDED.—Budgen, Sec. Lt. H. K., S. Wales Bord., attd. R.F.C.
Coningham, Capt. A., R.F.C.
James, Lt. H. H., Manch. R., attd. R.F.C.
Tayler, Sec. Lt. St. C. C., R. Suss. R., attd. R.F.C.
Woodbridge, Sec. Lt. A. E., R.F.C.

MISSING.—Carson, Sec. Lt. T. L., R.F.C.
Kellog, Sec. Lt. W. B., R.F.C.
Leete, Sec. Lt. S. J., Worc. R. and R.F.C.
Longton, Lt. J., A.S.C., attd. R.F.C.
Nickalls, Lt. H. G., Yeo. and R.F.C.
Watt, Sec. Lt. W. H., Ches. R., attd. R.F.C.

PREVIOUSLY REPORTED MISSING, NOW REPORTED PRISONER IN GERMAN HANDS.—Durkin, Sec. Lt. F. V., Worc. R. and R.F.C.

Reported August 13th.

PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—Mills, Lt. W. L., R.F.A., attd. R.F.C.

DIED.—Crerar, Sec. Lt. M. C., R.F.A., attd. R.F.C.

WOUNDED.—Campbell, Capt. W. C., D.S.O., M.C., R.F.C.
Earwaker, Sec. Lt. R. N. D'O., Manch. R. and R.F.C.
Howes, Sec. Lt. W. H., R.F.C.
Irwin, Sec. Lt. A. C. S., R. Ir. Rif., attd. R.F.C.

MISSING.—Beldam, Lt. C. H., Camb. R. and R.F.C.
Skeffington, Sec. Lt. H. N. S., R.F.C.

PREVIOUSLY REPORTED MISSING, NOW REPORTED WOUNDED AND PRISONERS IN GERMAN HANDS.—Smith, Lt. V., North'd Fus., attd. R.F.C.
Stewart, Sec. Lt. J. D. M., R.F.C.

PREVIOUSLY REPORTED PRISONERS OF WAR, NOW REPORTED WOUNDED AND PRISONERS IN GERMAN HANDS.—Crisp, Sec. Lt. A. E., Norf. R. and R.F.C.
Gilchrist, Sec. Lt. W., Rif. Brig., attd. R.F.C.
Holman, Sec. Lt. L., Hussars, attd. R.F.C.
Illingworth, Sec. Lt. F. W., Sco. Rif., attd. R.F.C.

AUSTRALIAN FORCE.—ACCIDENTALLY KILLED.—Trout, Lt. R. C., F.C.

WOUNDED.—Taylor, Sec. Lt. H. F., F.C.

PREVIOUSLY REPORTED MISSING, RELIEVED KILLED, NOW REPORTED DIED OF WOUNDS AS PRISONER IN TURKISH HANDS.—Steele, Sec. Lt. N. L., F.C.

CANADIAN CONTINGENT.—KILLED.—Dracup, Lt. G. F., Cent. Ont. R., attd. R.F.C.

ACCIDENTALLY KILLED.—Michener, Lt. L., Engrs., attd. R.F.C.

MISSING.—Malloch, Lt. C., E. Ont. Regt., attd. R.F.C.

* * *

CASUALTIES AMONG WARRANT OFFICERS, N.C.O's, AND MEN OF THE R.F.C. The dates are those of the official list :—

WOUNDED.

The following are reported Prisoners of War in lists received from the German Government :—

August 2nd.—R.F.C.—Loughlin 39972 2nd Cl. Air Mech. J. W. (Widnes); R.F.C.—Wait 78419 Sgt. T. E. (Cwmnbran).

August 4th.—R.F.C.—Lewis 78492 Sgt. G. (Birmingham).

The Black Watch, attached R.F.C.—Sturrock 1888 L.-Cpl. C. (Forfar).

PERSONAL NOTICES.

Deaths.

ANTHONY.—Capt. J. R. Anthony, R.F.C., was reported prisoner of war some time ago, and news was recently received that he had died of wounds. He was the son of the late Alderman Anthony, of Pwllheli. Capt. Anthony was wounded while attacking Germans, who were in superior numbers. He showed supreme gallantry in air fighting. Before the war he was a solicitor at Pwllheli.

BAILEY.—Sec. Lt. Clive Maxwell Bailey, R.F.C., who was killed while flying on August 3rd, was the elder son of Mr. Reginald Bailey, of Barton Hatch, Limpsfield, Surrey, and was aged 23. He was an undergraduate of Caius College, Cambridge, and before joining the Flying Corps he had served with the Royal Fusiliers at the front as a bomber, having enlisted in the Universities' and Public Schools' Battalion of that Regiment.

CONRAN.—Major Owen Mostyn Conran, King's Own Royal Lancaster Regt., attached R.F.C., who was killed in France on the night of July 28th when on bombing duty, was the youngest son of the late Major Conran, Essex Regt., and of Mrs. Conran, of Brondyffryn, Denbigh. He was born on April 1st, 1881, was educated at Shrewsbury, served in the South African War, and joined the Royal Lancaster Regt. from the South Lancashire Militia in 1901.

He was promoted Captain in July, 1907, and on July 29th, 1913, was seconded for service with the Egyptian Army, becoming **Major in September, 1915. At the outbreak of war he saw active service in Egypt and the Sudan, and did a considerable amount of flying. In July, 1916, he was sent to England on sick leave, during which he obtained permission to become attached to the R.F.C.**

In November, 1916, he was made Flt. Commander, and in April, 1917, he went to France. The following is quoted from letters announcing his death :—"He is a very great loss to me, and will be missed by everyone, officers and men alike, throughout the squadron." "He had just completed with great courage and success a most difficult and dangerous task."

CUTLER.—Capt. Stuart Le Geyt Cutler, A.S.C., attached R.F.C., who was killed in action on July 9th, was the only son of Major J. F. Cutler and Mrs. Cutler, of Jersey. He was 23 years of age.

HOLMES.—Lt. Thomas George Holmes, R.F.C., who was previously reported missing, and is now believed to have been killed in action on the night of the 6th-7th May, 1917, was the eldest son of Mr. and Mrs. T. B. Holmes, Petridge Wood, near Redhill. He was 24 years of age.

MOORCROFT.—1st A.M. Frederick John Moorcroft, R.F.C., who was killed on active service on August 8th, was the youngest son of R. K. and A. L. Moorcroft, Mill Road, Epsom. He was 20 years of age.

PAGET.—Lt. Gerald L. Paget, Northumberland Fusiliers, attached Australian Flying Corps, who was killed in an air fight on July 13th, was the youngest son of the late Arthur Paget and of Mrs. Arthur Paget, and husband of Winifred Paget. He was 23 years of age.

PIZEY.—Sec. Lt. Noel Martin Pizey, Yeomanry, attached R.F.C., who died on July 27th of wounds received the same day, was the elder son of the late John Martin Pizey and Mrs. Pizey, of Cothamside, Bristol. He enlisted as a trooper in the Yeomanry in 1914, and later joined the Inns of Court O.T.C., receiving his commission in December, 1915. He was sent to France in November 1916, and attached to the R.F.C. a few months later. He met his death during a fight between five British machines and 20 of the latest type of enemy machines, seven of which were brought down, while all the British regained their lines.

SHARPE.—Sec. Lt. Maurice Sharpe, R.F.C., after having been reported missing, is now officially reported killed in action. He was the youngest son of Sir Alfred Sharpe, C.B., K.C.M.G., and of Lady Sharpe, of Elmhurst, Lancaster. Educated at Rugby, he had a business training with Messrs. Storey Bros., Lancaster. He took part in the campaign in the Cameroon, and afterwards obtained a commission in the R.F.C. He was 29 years of age. He was a keen Rugby forward, and excelled in rowing, hockey, and motoring. He is the seventh Rugby forward of the Vale of Lune Club who has been killed in action. Ten of the playing members of the club have fallen in the war.

SHIRLEY.—Archibald Vincent Shirley, Yeomanry, attached R.F.C., who was killed on June 8th in an air fight, was the only surviving son of Walter P. Shirley, Leckwith, Cardiff, and grandson of the late Mr. Archibald Hood.

SNOWDEN.—Lt. Harold Jackson Snowden, South Lancashire Regt., attached R.F.C., who died on August 11th of wounds received in action on July 31st, was the youngest son of the late Joseph Snowden, and of Mrs. Snowden, The Chantry, Stanmore. He was 20 years of age. Funeral Service took place at St. James's, West Hampstead, on August 15th, at 2.30, and afterwards at West Hampstead Cemetery.

SWORDER.—Killed in action, on April 2nd, Lt. Hubert Pelham Sworder, the Queen's Regt., attached R.F.C., who was killed in action on April 2nd, was the younger son of Mr. and Mrs. John Sworder, of Barkway, Herts. He was 19 years of age.

TATE and PETTIGREW.—Lt. William Edward Tate and Lt. Gilbert Thomas Richardson Pettigrew, both attached R.F.C., were killed in an aeroplane accident in North Wales on August 12th.

TAYLOR.—At an inquest on August 11th concerning the death of Lt. William Alexander Taylor, R.F.C., who was instantly killed on the previous day as the result of a fall from a height of 3,000 ft. near Rugby, it was stated by Capt. Kenneth Leask (Flight Commander) that Mr. Taylor was evidently about to loop at the time of the accident. His machine suddenly went up vertically at a great speed, but the left wing collapsed and the aeroplane fell with a spinning nose-dive. The witness had flown the machine on the previous evening, and it was in perfect order.

Probably Mr. Taylor pulled the control back too hard, causing such a strain that the left wing collapsed. A verdict of accidental death was returned. The deceased officer was the son of Mr. William Taylor, of Mary Hill Park, Glasgow. He had for some time been an observer in France.

WALLER.—At Hounslow on August 11th an inquest was held on Sec. Lt. C. R. Waller, R.F.C., whose home is at Meopham, Kent.

The evidence showed that on August 9th Mr. Waller was sent up for an altitude test, and he had reached 16,000 ft. when the machine nose-dived, righted itself, then dived again and rolled over. An explosion occurred, and the machine was blown to pieces, the aviator being picked up in a hedge dead.

Capt. C. P. Inglefield said that the machine was in sound condition. Mr. Waller had never before flown more than 3,000 ft. up and it was very unusual and dangerous to fly 16,000. at a first attempt. He thought that the officer must have become faint, or had a heart attack, for his flying cap, which was strapped under his chin before he went up, was found unstrapped two miles away, and one of the first things a flying man did if he felt faint was to unloose the strap. The pressure of air at such a height might have caused faintness. It would be useful to have an air pressure gauge on the machines. [Is not an aneroid a pressure gauge?.—Ed.]

The jury returned a verdict of "Accidental death."

Mr. Waller, who was 19 years of age, was the son of Bishop and Mrs. Waller, of Tinnevelly, India.

VALENTINE.—It is with deep regret that one records the death of Major James Valentine, D.S.O., R.F.C. A brief message from Russia states that he died in Kieff after an operation. The cause of the operation is at the moment unknown.

James Valentine was born in London on August 22nd, 1887. In his early days he was concerned in the motor industry, and was known as one of the most daring and skilful drivers on the road, though he never drove in any of the big races. When flying began he naturally gravitated towards the new form of locomotion, and in 1910 began to take an active part therein. He acquired a Gnôme engine and joined forces with Mr. R. F. Macfie at Brooklands, the resulting Macfie biplane being an excellent example of its period. On this machine James Valentine and Robert Macfie took their certificates, the former's ticket being No. 47, dated December 31st, 1910.

WHERE FLYING MEN ARE FITTED OUT.

AVIATION KIT BY SPECIALISTS

HIMSELF a specialist, the flying man believes profoundly in the specialist in kit. That's why the air-services tradition already is that every aviation officer—at every stage from cadet-chrysalis to full-blown flyer—must get his kit at Dunhill's.

It's not just that Dunhill kit means quality—what matters more is the knowledge and understanding built into every detail of equipment. And that means comfort.

Cadets may look for cut and style in uniform—and at Dunhill's they're always sure of that. But when a man gets wings and knows the difference betwixt a rumpty and a quirk, comfort's his main concern. And kit comfort means kit-unconsciousness when you're drilling the atmosphere at 100 m.p.h., or executing a zoom for stunt's sake or safety.

And then there's the downright economy of dealing at Dunhill's—not the economy of cheap outfit, but of a reasonable sum rightly invested. These prices—keeping Dunhill quality in mind—speak for themselves :

Tunic, in finest whipcord,
£5 : 10 : 0

Breeches, best Bedford cord,
£3 : 3 : 0

Dunhills Ltd.

MANCHESTER : 90 and 92, Cross Street.
GLASGOW : 72, St. Vincent Street.

Soon afterwards James Valentine went to Paris, where he was taken on as a pilot by the Deperdussin firm, then making a great name for itself, and he suddenly acquired popular fame by his admirable performance in the "European Circuit" of 1911. He was one of the few pilots, and the only British competitor, to complete the course, which ran from Paris to Reims, Utrecht, Amsterdam, Brussels, Calais, Shoreham, Hendon, and back to Paris. A wonderful journey at the period.

A few weeks later, on the same little Deperdussin monoplane, with a 50-h.p. Gnôme, he started in the "Daily Mail" "Circuit of Britain," and covered the whole course, the only others to finish, out of some 20 odd starters, being Lt. Jean de Conneau ("André Beaumont"), Jules Védrines, and the late Mr. S. F. Cody, in that order. These performances stamped James Valentine as a pilot of the first class, and after a little exhibition flying, including some wonderfully skilful work at Shanklin, Isle of Wight, he joined the Bristol Co., and flew one of the Coanda-Bristol monoplanes in the Military Trials on Salisbury Plain in the autumn of 1912.

Thereafter he devoted most of his time to the motor trade, as aviation during the almost stagnant period of 1913-14 could hardly provide a living for its devotees, but he flew occasionally, and always with consummate skill and judgment. During this time he became a partner in the firm of Valentine and Robertson, now Robertson and Co., of Albemarle Street.

On the outbreak of war he joined the R.F.C., and flew on active service. His flight from Milan to Paris on a big Caproni biplane was a fine performance. Previously he had been appointed to oversee the acquisition of aircraft matériel by the R.F.C. from the French Aircraft Industry, for which work his intimate knowledge of the motor trade and of the early aircraft firms in both countries particularly qualified him. His success in promoting cordial relations between the parties concerned was rewarded by the French Government with his appointment to the Legion of Honour.

At a later date he was attached to the Russian Commission of the Comité de Ravitaillement, and, in this connection, he was sent on a special mission to Russia, with the rank of Major, R.F.C. Quite recently, his services during the war were rewarded by his appointment to the Distinguished Service Order.

In 1914, James Valentine married Eileen, daughter of the late Major-General Charles Knox, C.B., late Scots Guards, and of Lady Sybil Knox, sister of the present Lord Lonsdale, and all will offer their deepest sympathy to his young widow.

Many of the old hands among motorists and aviators will mourn the death of one of the pioneers of both sports, for Jimmy Valentine, as he was generally called, had won personal popularity to a high degree. He possessed singular charm of manner and an engaging smile, which somehow proved irresistible, even when one felt that one ought to be annoyed with him for some wild feat such as the youthful sportsman of the pre-war period affected. His good temper and his cheery *nonchalance* carried him through many a difficult position, and won him friends wherever he went. Even those who best knew his faults liked him personally none the less, and of all the friends one has lost in the war, few will be more missed than Jimmy Valentine.—C. G. G.

An old friend of Major Valentine's writes :—

"It is strange to think that James Valentine is dead, he who had so much of the joy of life.

"I knew him first in 1909 at Brooklands, in the days when motor racing by amateurs was most prominent in the annual programme. He drove a touring La Buire, stripped of all encumbrances, and also, it must be admitted, stripped of all beauty as well. His success in racing was limited, but his popularity was great. Nothing seemed ever to disturb the high serenity of his spirits. Gloom, if he ever fell beneath its veil, came only in the twilight hours when none was by to see.

"Later we drifted apart. But from time to time we met, and on earth a greater incongruity than the association of Jimmy Valentine with his vivid driving and the old Georgian mansion sleeping nobly in a wooded park where his Fates had led him for a temporary residence! Here, too, his gaiety overcame the disapproval not unnaturally brought into being by the vehemence of his passage over the country roads.

"Later we drifted apart. But from time to time we met, and all was as if no interruption had been. He learned to fly with the same erratic method of life that gave him personality. He flew well when he cared to make the effort. But his very enthusiasm, uncoupled as it was with perseverance, prevented any continuity of purpose and consequently he did not leave any abiding impression on the flying of his day.

"And now he has left the troubles of this world. The abiding memory of 'Jimmy' Valentine will be of a lovable personality, who, with all his faults, was a joyous figure in life, who gave happiness to many, and who, in his day, had something of that generosity of mind which is the rarest of all human attributes.—W."

Engagements.

LOVEMORE—GOULD.—An engagement is announced tween Mr. Norman B. Lovemore, R.F.C., youngest son of W. B. Lovemore, of Mbabane, Swaziland, South Africa, Nowell, only daughter of Mr. Lionel F. Gould, of The G House, Bilton, Rugby.

PATTERSON—FOTHERINGHAM.—The marriage betw Lt. Robert Wilson Patterson, R.F.C., late R.E., second so Mr. and Mrs. Patterson, 32, Westbourne Gardens, Glasgow, Mabel, youngest daughter of Dr. and Mrs. Fotheringham Rosshill, Motherwell, and Largo, Fife, will take place qu at Largo on Thursday, August 23rd.

ROWDEN—JOBSON.—An engagement has been annou between Capt. C. R. Rowden, M.C., Worcestershire Regt. R.F.C., only son of A. R. Rowden, of Hillend, Eastnor, Ledb and Frances, elder daughter of Mrs. Jobson, Millcroft, Rot dean, Sussex.

SHINGLETON—BARCHARD.—The engagement is annou between Lt. Frank Shingleton, A.S.C., attached R.F.C., so son of Mr. and Mrs. Frederick Shingleton, 67, Cornwall Gar and Leonor Christin, only daughter of Mr. and Mrs. Harry chard, Northrepps, Norfolk.

Marriage.

SMYTH—JONES.—On August 6th, at Murree-Punjab, I Capt. Geoffrey Meliss Smyth, Loyal North Lancashire R attached R.F.C., only son of Percy Meliss Smyth, 5, Foulis race, Onslow Square, S. W., was married to Helen Mill (Nellie), third daughter of J. J. C. Jones, C.B., 14, Cumbe Road, Kew Gardens, W., late Chief Commissioner of Met litan Police, Dublin.

Births.

GULLIVER-CRADWICK.—On August 9th, at "Wi mere," Alverstoke, the wife of Capt. L. Gulliver-Cradwick, R. —a son.

STALLIBRASS.—On August 10th, at 14, Princes Gate, S the wife of Lt. T. L. W. Stallibrass, R.F.C., of a daughter

Capt. W. A. Bishop, whose "independent" air offensive ag the Huns won him the V.C., is the only Canadian officer holds, in addition to the V.C., the D.S.O. and the Mil Cross. He is only 23 years old, was born at Owen Sound, tario, and is a graduate of the Royal Military College, King Ontario, the Canadian Sandhurst, whence many fine fig men have come. Capt. Bishop came over with the 7th Can Mounted Rifles, but never went to France with them. Soon reaching England he joined the R.F.C., went to the fro January, 1916, and attained the rank of Flight Command April of this year. Up to the end of July Capt. Bishop brought down no fewer than 36 enemy machines.

* * *

The special correspondent of the "Morning Post," writin the recent fighting around Glencorse Wood, from British H quarters in France on August 12th, says :—

Their (the Germans') aeroplanes are fighting again for ma of the sky, and many thrilling combats have taken place d the past three days.

* * *

The Annual Sports of the R.F.C., stationed at Hounslow, place on August 6th. The following were the prize-winners

440 Yards, flat.—(1) Sgt. Davis, 57 sec.; (2) Sgt. Sharr (3) Air Mech. Stanton.

Throwing the Cricket Ball.—(1) Air Mech. Dann, 108 ft. Lt. Weller; (3) Cpl. Ault and Air Mech Gale tied.

Long Jump.—(1) Lt. Flower, 16 ft.; (2) Air Mech. Hol (3) Cpl. Harris and Cpl. Ault tied.

High Jump.—(1) Lt. Norman, 4ft. 11 in.; (2) Cpl. Ault Air Mech. Armes and Lt. Flower tied.

1 Mile, flat.—(1) Air Mech. Janson, 5 min. 1 sec.; (2) Fisher; (3) Air Mech. Cleaver.

100 Yards, flat.—(1) Capt. Collie, 10 sec.; (2) Sgt. Davi Sgt. Sharrocks.

1 Mile, flat.—(1) Air Mech. Janson, 5 min. 7 sec.; (2) Air Riley; (3) Cpl. Asker.

4-Legged Race.—(1) Air Mech. Clough's Team; (2) Air Thompson's Team.

100 Yards Hurdle.—(1) Capt. Collie, 13 2/5 sec.; (2) Air Gale; (3) Cpl. Ault.

¼ Mile, flat.—(1) Pte. Kidman, A.S.C., 55 3/5 sec.; (2) Leadbitter, A.S.C.

Boat Race on Poles (1), 42, H.Q., 26 2/5 sec.; (2) 3 A.F

1 Mile, flat.—(1) Cpl. Pratt, R.F.C., Greenwich, 4 min. 2 sec.; (2) Air Mech. Gale; (3) Cpl. Asker.

Mop Fight.—(1) Sgt. Martindale and Air Mech. Sweening Flt. Sgt. Armstrong and Flt. Sgt. Elsby; (3) Air Mech. C and Air Mech. Henderson.

½ Mile, flat.—(1) Air Mech. Janson, 2 min. 20 sec.; (2) Davis; (3) Air Mech. Riley.

Tilting the Bucket.—(1) Sgt. Martindale and Air Mech. Sweeney; (2) Air Mech. Livingstone and Air Mech. Owen; (3) Lt. Balfour and Lt. Davis.

Corporals' Race, 100 yards.—(1) Cpl. Ault, 10 4/5 sec.; (2) Cpl. Fisher; (3) Cpl. Harris.

Sergeants' Race, 100 yards.—(1) Sgt. Davis, 10 3/5 sec.; (2) Sgt. Sharrocks; (3) Sgt.-Maj. Richardson.

Officers' Race, 100 yards.—(1) Capt. Collie, 10 2/5 sec.; (2) Lt. Baulder; (3) Lt. McIlwraith.

¼ Mile, flat.—(1) Cpl. Bentley, 55 3/5 sec.; (2) Air Mech. Dann; (3) Air Mech. Gale.

1 Mile, flat.—(1) Pte. Kidman, A.S.C., 4 min. 35 sec.; (2) Cpl. Pratt, R.F.C.; (3) Cpl. Beard.

Tug of War.—(1) A.R.S.; (2) 42 Squadron.

220 Yards.—(1) Sgt. Davis, 25 sec.; (2) Cpl. Bentley; (3) Air Mech. Dann.

Boot Melee.—(1) Air Mech. Stanton; (2) Air Mech. Bartlett; (3) Air Mech. Livingstone.

½ Mile, flat.—(1) Air Mech. Tutfield, 42 sec.; (2) Air Mech. Pratt; (3) Cpl. Bentley.

Sack Race.—(1) Flt. Sgt. Armstrong; (2) Air Mech. Robson; (3) Air Mech. Bell.

Bumping Melee.—Not completed.

Relay Race.—(1) W.A.R.S.; (2) 19 Squadron Officers.

Pillow Fight.—(1) Air Mech. Stanton; (2) Air Mech. Cleaver; (3) Flt. Sgt. Elsbee.

Obstacle Race.—(1) Lt. McIlwraith; (2) Lt. Balfour; (2) Air Mech. Taylor and Air Mech. Bourne tied.

Band Race.—(1) Boy T. Jones, Middx. Regt.; (2) Pte. Hoar, Royal Fus.; (3) Pte. Paynter, Middx. Regt.

Tug of War.— Police v. R.F.C.—Won by the Police.

Station Championship.—Won by Sgt. Davis.

FRANCE.

Official Communiqués.

August 8th.—Army of the Orient.—British aviators bombarded the enemy camps south of Veles (Serbia).

August 9th.—Yesterday, in spite of the bad weather, which rendered their mission particularly difficult, our air squadrons carried out many raids and bombarded the aviation grounds of Colmar and Habsheim (east-south-east of Mulhouse). All the objectives were hit.

Army of the Orient.—British aviators bombarded with success the aerodrome at Livanovo (Bulgaria, north of Zernovol) and the enemy depots in the region of Seres (Struma front) and in that of Stojakovo (between Lake Dorian and the Vardar).

August 11th.—German aeroplanes last night bombarded the region of Nancy. There were no casualties and the material damage done was very slight.

Two German battle planes were brought down by our pilots on August 10th. Two other machines were badly damaged and forced to come down in their own lines.

Our bombarding aviators effected various operations. The aviation ground of Schlettstadt (north of Colmar) and the barracks of the Forest of Houthulst received several bombs.

Army of the Orient.—The British air service bombarded enemy hangars near Drama.

August 12th.—It is confirmed that a German aeroplane was brought down on August 9th in aerial combat on the Belgian front.

Yesterday an enemy machine was brought down by our machine-gun fire north-east of Vauxaillon (Aisne front).

As a reprisal for the bombardment carried out by the Germans against Nancy and the region north of Paris, two of our aeroplanes, piloted by Lieutenant Mezergues and Sub-Lieutenant Beaumont, bombarded yesterday the town of Frankfurt-on-Main. Both machines returned unharmed.

On the night of the 10th and during the daytime yesterday our aeroplanes bombarded on the Belgian front enemy barracks north of the Forest Houthulst and the railway stations of Cortemarck (east of Dixmude) and Lichterwelde (east of Cortemarck). A fire and violent explosions were observed at Lichterwelde.

The aviation ground at Colmar also received many shells.

August 13th.—During yesterday two German aeroplanes and a captive balloon were brought down by our pilots. Three other enemy machines had to land severely damaged.

Army of the Orient.—British aviators bombarded the enemy airsheds at Xanthi (in Bulgaria, on the Salonika-Constantinople railway), French aviators the region between lakes Malik and Ochrida.

* * *

It was reported from Paris on August 7th that during the month of June French seaplanes carried out 3,139 flights, attacked German submarines on ten occasions, discovered in six cases enemy mine fields, and took part in nine night bombardments on enemy bases. They also carried out some reconnaissances at a considerable distance from their base.

During the same period French naval airships made 141 trips, representing a total of 483 hours in the air.

GERMANY.

Official Communiqués.

August 10th.—Lt. Gontermann shot down two enemy captiv balloons.

August 11th.—Nineteen enemy aeroplanes and two captiv balloons were shot down, mostly in aerial engagements, which particularly in Flanders, were very numerous. Vice-Sergt. Mulle achieved his 20th and 21st aerial victories.

August 12th.—First-Lt. Ritter von Tutschek brought down hi 22nd and 23rd opponents in aerial battle.

August 13th.—One of our aviation squadrons yesterday a tacked England. Bombs were dropped with visibly good resul on the military works of Southend and Margate, at the mou of the Thames. One of our aeroplanes is missing.

On the Continent yesterday 14 enemy aviators and one captiv balloon were shot down.

In the month of July the losses of our adversaries amounted t 34 captive balloons, and at least 213 aeroplanes, of which were brought down in flames as a result of aerial attack behin our lines and 115 beyond the enemy lines. We have lost 6 aeroplanes but no captive balloons.

* * *

A telegram from Frankfurt-on-Main, dated August 13th, says A bomb was dropped by an enemy aviator on August 11th. killed nobody and wounded a few inmates of a hospital slightl The aviator dropped five further bombs in a small wood west Frankfurt without causing any damage. On the following da an enemy aviator again appeared over Frankfurt and droppe several bombs, which fell in crowded streets and killed fo people and injured several.

* * *

A message from Paris on August 13th says that a remarkab letter found on a German prisoner throws considerable light the results obtained in the French raid on Essen last July. T letter is dated July 7th, and the writer states:—

"To-night we have been visited by an enemy air squadro Shortly before three I was awakened, and anti-aircraft guns beg to fire a hundred shots. Our windows shook, factory syrens ble and bells rang the tocsin. It was terrible. All lamps were p out, everything was in darkness, and people hid in cellars.

"To-day we are still trembling all over. When it became qui again we went back to bed, but other aeroplanes came, and all began over again. To-day children are picking up quantiti of shells in the streets. Bombs were dropped on the Thyss factory at Mülheim. The new munition factory in Kruppstras has been utterly destroyed (kaput). I cannot give you full d tails before to-morrow. Bills have been just posted telling that the raid is to be renewed to-night. No one will go to sle to-night at Essen. The good God will protect us well. If o we were near the end!"

* * *

A message from Amsterdam on August 9th states that in Bar von Richthofen's memoirs, which have just been published, t German aviator says, speaking of the British aviator:

"He is a dashing fellow. He used to come now and then a pelt Bœlcke's flying ground with bombs; he simply challeng one to battle, and always accepted it. I hardly ever encounter an Englishman who refused battle."

[One assumes, from the fact that his memoirs are publishe that Baron von Richthofen was killed, as rumour stated, thou no official notification of his death has appeared in this countr —Ed.]

ITALY.

Official Communiqués.

August 8th.—On the 6th inst. and yesterday our bombi flights, notwithstanding heavy anti-aircraft fire, dropped fo tons of high explosives on the enemy's military hutments Chiapovano Valley (north-east of Gorizia), causing great destr tion. One of the escorting machines was hit by enemy fire, b succeeded in landing within our lines. All the other machin returned safely to their bases.

August 9th.—In the morning our flights, persevering in t operation begun on the 6th inst. raided Chiapovano Valley (nor east of Gorizia) causing, by dropping numerous bombs, new struction and fires in the military establishments of this locali The heavy defensive fire reached the machines and hit some them, but our gallant aviators were able to bring them all ba to their bases.

August 10th.—On the night of August 8th-9th some lar flights of our bombing aeroplanes renewed the attack on t military establishment of Pola. Favoured by a good light, o aviators effectively bombed the arsenal and the enemy fleet anchor, which was clearly visible, by dropping eight tons of hi explosives on them. After having escaped the heavy anti-aircr fire and repulsed the enemy seaplanes risen to oppose them, our machines returned to their bases.

Aug. 11th.—During the evening our flights, strongly escort bombarded the enemy's military works in Chiapovano Val

THAT'S WHERE THE

On land the overheated plug is, at most, a worrying detail—in the air it is positively dangerous.

FORWARD

comes in, because, if it had no other merit, its patent copper fins, having a conductivity over 60 per cent. greater than that of steel, ensure a coolness impossible with any other.

Note all Forward Insulators are made of best quality India Ruby Mica and the plug's unique construction allows of thinner and lighter fins—another decided advantage.

THE FORWARD IS MADE IN TWO MODELS, TYPE S AND TYPE R.

Type S (illustrated) is made either with long or short barrel and is intended for engines of the stationary type—Type R for engines of the rotary type, and the latter has been described by "The Aeroplane" as a distinct advantage over some of the heavy plugs which are ordinarily used.

You should enquire—

FORWARD MOTOR Co.,
43, Forward Works,
Summer Row, BIRMINGHAM.

To motorists and members of the motor industry the name of Arthur Bray will be very familiar, from his long and important association with Charles Jarrott. To-day Arthur Bray is only 30; but from 1907 his has been a prominent figure in all the great Trials, Hill Climbs and Speed Records which have done so much for the development of the industry. As mechanic to the great "C.J." he rode in the St. Petersburg—Moscow Race; and when it comes to trophies of his own, this merry-faced boy can produce about twenty-five pots and medals bearing most of the famous names in the history of British motoring.

August 13th, 1914, found Lieutenant Bray in France doing his bit; and he is still doing it with all that irrepressible enthusiasm which marks the true sportsman.

H.M.S. ————

9.7.17.

My dear Brett,

Many thanks for the cylinders which arrived quite safely. I must say that I was agreeably surprised at the splendid job which you made of the repair to the cracks in the jacket. As it was impossible to obtain a new cylinder casting it meant, briefly, that without your timely aid the car would have been out of action until the end of the war. I feel certain that a novice would not have discovered that the cylinders had been cracked at all, and, knowing the difficulties experienced with welding, I can only assume that the "Barimar" process has been brought to the acme of perfection.

Wishing you every success,
Faithfully yours,
(Signed) ARTHUR BRAY,
Lieut. R.N.V.R.

BARIMAR

Scientific Welding Service

stands alone in this vital matter of metal repair. Barimar science covers every branch of the work. Barimar organisation is a triumph of method. Barimar Guarantee covers every customer, great and small.

When you send your repairs to Barimar, you engage that Scientific Repair Service which has been and is commanded by the greatest National undertakings. And yours will be the same service: prompt, courteous, incomparably efficient for workmanship, invariably moderate in charges.

Address Dept. B.C.:

Remove all fittings. Label plainly with your name and address. Despatch goods carriage paid, and post written instructions same day.

(north-east of Gorizia) by dropping three tons of high explosives. The intense anti-aircraft fire was inefficacious, and the numerous hostile chasing planes, strongly attacked by our machines, had to withdraw. One was seen to land in the direction of Planina (east of Mont Nero). On the 8th inst. an enemy aeroplane, after a brisk fight with one of our chasing machines, was forced to land near Tolmino; another was brought down yesterday in our lines west of Flondar (Carso). The aviators were made prisoners.

August 12th.—Yesterday and this morning our flights, accompanied by escorting planes, returned to the Chiapovano Valley to renew the bombardment of the military works there. Having dropped more than four tons altogether of torpedo and incendiary shells and obtained direct hits on their objectives, all our battle and chasing machines, escaping the enemy's very heavy fire, returned safely to their bases. On the 10th inst. an enemy machine, beaten in an air fight, was forced to land east of Dosso Faiti (Fajti Hrib, Carso).

August 13th.—There was considerable aerial activity along the whole front.

* * *

The following details concerning the operations mentioned in the Italian communiqué of August 3rd have been received by Reuter's Agency from an authoritative source:—

The air raid on the military establishments in Pola was carried out by 36 Italian machines, but, owing to the haze, only a part of them succeeded in identifying the objectives assigned to them. They refrained, therefore, from throwing bombs in order not to hit the town and produce casualties among the civil population, and returned to their base without having accomplished any offensive action.

The principle adopted by the Italians in such cases is worthy of notice, and is in direct contrast with that of the Austrians, who, even in these nights of full moon, have thrown bombs on many inhabited localities along the sea coast and in the plain of Venetia from the mouth of the Po to that of the Isonzo.

When the first group of Italian aeroplanes, accompanied by motor-launches, which marked the route, arrived over Pola, the anti-aircraft defences, warned by the whirr of the motors, turned on all their searchlights. One of the Italian machines then loosed a parachute rocket. The enemy's searchlights suddenly went out, and the rocket showed up to the Italian aviators all the military works of this great naval station. The Arsenal, the Rock of Olives, where the base of the submarines is established, and the fleet at anchor were suddenly revealed.

On these various positions about 6½ tons of mines of 260 and 162 millimetres were dropped by two successive waves of aeroplanes. Large fires were observed in the Arsenal, and at the Rock of Olives. Returning home, the Italian aviators saw the sky lit up for a long time, long tongues of red light reaching high up into the sky.

Though the fire of the enemy's anti-aircraft batteries was very fierce and intense, all the Italian machines returned safely to their bases.

The Austrian air service has lost in the last few days three machines, one of which was brought down on July 31st by Capt. Baraera, and fell in flames in the Italian lines near Podgera. The others were brought down by Major Piccio. Of these, one fell in flames to the south-east of Tolmino, between the first and second line of Austrian trenches; the other had to land quickly about a hundred yards from the other, and was destroyed by the Italian artillery.

* * *

The newspapers report that the American Aero Mission visited various sections of this front flying thereto on Capronis, and being received by the Head of the Army in the absence of General Cadorna. Here it is allowed to be printed that the mission has arranged to supplement the Italian Air Forces if such help should be welcome.

The American Mission having left this country, the papers announce America's intention not only to devote some of her aero production to this front, but to entrust the training of some of her future pilots to the Italian Military Schools.—T. S. Harvey.

RUSSIA.

Official Communiqués.

August 7th.—Aviation.—Our aeroplanes dropped bombs on the railway station of Baronovitchi. Successful hits were observed.

Baltic Sea.—On August 4th and 5th enemy aeroplanes made a series of flights on the coast and islands of the Gulf of Riga. Recently there has been noticed an increase of scouting and activity in the Gulf of Riga.

August 13th.—Our aeroplanes dropped bombs on various points in rear of the enemy's lines.

BELGIUM.

Official Communiqué.

August 10th.—In the evening of the 9th our artillery brought down a German aeroplane.

ROUMANIA.

Official Communiqué.

August 10th.—There is considerable aerial fighting.

SERBIA.

Official Communiqué.

August 12th.—Our aeroplanes dropped several bombs along the front.

TURKEY.

A report from Athens states that Allied warships have been bombarding the Turkish batteries on the coast of Asia Minor, opposite Chios, since August 7th.

British monitors were successful in reducing one of the batteries to silence, and in destroying an aerodrome installed near the enemy battery.

HOLLAND.

The "Gazette de Hollande" (The Hague, August 7th), says that the remains of an aviator, presumably British, whose body was washed up on the northern shore in a state of decomposition, have been buried in the churchyard at Cocksdorp, on the island of Texel. On one arm was a nickel wristlet watch, with leather strap, and the aviator also wore a chain ring. The clothing included black leather trousers, and grey shirt. On the waistband was inscribed, "Wallade."

* * *

The Special Correspondent of the "Daily Chronicle, writing from Amsterdam on August 8th, says:—

The tables were neatly turned on a German waterplane yesterday (August 7th) in Dutch territorial waters.

The small Belgian fishing boat Vlissingen 59, of Middelburg, was engaged in fishing when a German waterplane swooped down upon it. The machine held two fliers, and one was put aboard the fishing sloop—such a small vessel, that it is worked by only two Belgians—as a "prize crew."

Orders were given for it to make towards Zeebrugge, the waterplane skimming over the waves beside it. The flying machine, however, soon after developed a defect and turned turtle, the occupant being drowned.

The fishing boat then turned and made off in the opposite direction, two Dutch naval craft coming up with it. One took the two Belgians and their German prisoner on board, while the other took the fishing boat in tow, and all returned to Flushing.

* * *

A German who came down near Oostburg on August 5th in an aeroplane and was interned proves to be a deserter, who chose this novel method of carrying out his project.

He was attached to an aviation camp at Knocke. Having waited for a favourable moment when nobody was near he flew away and made a safe descent on Dutch territory.

* * *

A message from Amsterdam, dated August 12th, states that according to a newspaper report the British Government has granted £10,000 compensation for the inadvertent dropping of bombs on Zierikzee by a British aviator.

British official quarters at The Hague have not yet received any information on the subject.

* * *

A report from Amsterdam on August 13th states that 50 Bulgarian and Turkish officers have arrived at Ostend, and are to be employed as aviators.

[This rumour doubtless arises from the alleged fact that the Gotha Squadron which has been bombing London has as its nucleus the famous Salonika-Bucharest Squadron from Servia.—Ed.]

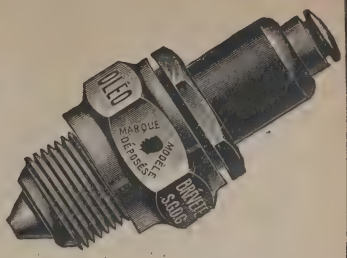
INDIA.

A report from Simla, dated August 10th, says that the Mahsuds have complied with the Government's terms. Three thousand of them assembled at Sarwekai, taking the oath of peace. Sir Charles Monro, in ordering the dispersal of the troops, praises the skilful operations and pluck of all arms, including the Nepalese contingent. He says that the tribesmen have for the first time felt the power of the Flying Corps.

GERMAN POISON SHELLS.

The following report was sent from France on August 9th:—

Armentières has had to be evacuated by the civilian population. The Germans for some days past have been throwing on the town a multitude of small shells which contain neither powder nor gas, but a colourless liquid. This liquid, which is similar to that which the enemy aeroplanes threw on London in the course of their last raid, evaporates slowly, producing a heavy gas, which filters through passages and descends to the cellars of buildings. This gas is very tenacious, and has somewhat similar effect to tear-producing gas. It has been found that women are greater sufferers than men, as the gas settles in the hair. Smoking is found to be an antidote to the ill-effects.



[It is well to note this fact, as it is quite probable that the same species of shell, in the form of bombs, may be used against London in the next air raid. Cellars, in such an event, are likely to be unhealthy, and top stories will be more popular. As modern bombs have a habit of penetrating to lower floors before bursting, it is probable that top floors are the best place in any case.—Ed.]

THE CURTISS CORRUPTION CHARGE.

At Bow Street Police Court on August 10th Sir John Dickinson resumed the hearing of the case in which William Augustus Casson, aged 64, barrister and retired Civil Servant, of 8, Bedford Road, Chiswick, and Wing Comdr. John Cyril Porte, R.N.A.S., are charged with having unlawfully conspired together and with Lyman J. Seeley and other persons to contravene and set at naught the Prevention of Corruption Act, 1906.

When the case was called, Mr. Casson surrendered to his bail, and Sergeant Woodhouse, warrant officer, informed the magistrate that Comdr. Porte was not in attendance.

Mr. R. D. Muir (instructed by Sir George Lewis) said he appeared for Comdr. Porte, who was ill and unable to attend the Court. He had been in bed since the last hearing on August 3rd.

A little later Dr. William Wilkinson, F.R.C.P., of Wimpole Street, arrived in Court, and entering the witness-box stated that as a lung specialist he had on Thursday been called in to see Comdr. Porte at the Russell Hotel, and found him suffering from an advanced stage of chronic pulmonary tuberculosis. He had that (Friday) morning made a more thorough examination of the case, and had come to the conclusion that Comdr. Porte could certainly not with safety attend the Court that week, and that he ought to have some weeks of rest, free from mental and physical strain, to avert certain dangers which threatened him.

After some conversation it was agreed that the case should for the present be proceeded with in Comdr. Porte's absence.

Sub-Lt. George Marsden, R.N.V.R., a barrister-at-law, who acted as secretary of the Butcher inquiry in relation to the Curtiss Aeroplane Company, said that Mr. Casson was examined before the Committee on three occasions, and Comdr. Porte on one occasion. He described some of the proceedings at the inquiry, and produced a large number of documents which were laid before the Committee.

In answer to Mr. Muir, the witness said that Comdr. Porte was not legally represented before the Committee of Inquiry, nor was anybody else. He was at no time warned that he need not answer any question that might tend to incriminate him. Nothing was said to him, as far as he remembered, to warn him that a prosecution might take place in consequence of the evidence he gave. Mr. Lyman Seeley was not a witness before the Committee, and so far as he knew there was no correspondence between the Committee and Mr. Seeley or Mr. Curtiss. The Committee did not take evidence on oath.

By Mr. Patrick Hastings.—The witness believed the Committee was appointed as the result of some questions in Parliament. It was appointed by direction of the First Lord of the Admiralty. As Comdr. Porte was a naval officer, a request to him to attend a Committee appointed by the First Lord would, of course, be equivalent to a command.

By Sir A. Bodkin.—Comdr. Porte was treated by the Committee with consideration, but his cross-examination was severe.

On August 11th Sir John Dickinson resumed the hearing of the case.

Commodore Murray F. Sueter, C.B., said that from August, 1915, to January, 1917, he was Superintendent of Aircraft Construction at the Admiralty. He first knew Commander Porte as a submarine officer, but he was invalided out of that service about 1911, and afterwards became connected with the Deperdussin Aeroplane Company, from which firm the Admiralty bought a few seaplanes. Lieut. Porte was well known as an expert in aviation; in fact, he was one of the pioneers, but had, witness believed, devoted his attention principally to seaplanes.

In 1914 there was a project for flying across the Atlantic, a prominent newspaper having offered a prize of £10,000 for the accomplishment of such a feat, and witness knew that in connection with that project the Curtiss Aeroplane Company was constructing a boat called the "America." Lieut. Porte was associated with the scheme, it being understood that he was to pilot the boat across the Atlantic. The Admiralty was very much interested in the matter, but the sudden outbreak of war in August, 1914, caused the project to be dropped. Up to that time the Admiralty had not placed any orders with the Curtiss Company.

On the declaration of war Lieut. Porte, as a Reserve Officer, returned from America to England, and reported himself for service to the Admiralty. He was shortly afterwards commissioned as a Squadron Comdr., being employed first at Hendon and then at Felixstowe. He told witness all about the "America" and her sister flying boat, and they discussed the performances of those machines. The question of the purchases of the two boats by the Admiralty was also discussed between them.

Eventually, after some controversy about price the Admiralty bought them, the negotiations being conducted through Comdr. Porte. When the boats arrived in England towards the end of 1914 they were put together at Felixstowe and tested by witness and Comdr. Porte. Witness made a favourable report upon them, and expressed the opinion that if they were developed they would be most useful machines. Contracts for four more of the same kind were then placed with the Curtiss Company, the letter with the order being sent to Mr. Lyman J. Seeley, who had been introduced to witness in October or November, 1914, as the agent of the Company.

Negotiations followed for the building of other machines and the supply of motors, and in consequence of the extensive orders given by the Admiralty the Curtiss Company enlarged their works. The Admiralty took practically the whole output of the firm from March to September, 1915. In consequence of serious delays in delivery, an Admiralty inspector was sent to America to look into the matter, with the result that great improvements were effected both in regard to workmanship and time of delivery.

In August, 1915, Comdr. Porte went to America on behalf of the Admiralty with designs for several improvements in the flying boats and their engines, and on his return in September he furnished a report on the Curtiss Company's works. This was followed by further orders to the company for aeroplanes, seaplanes, and different kinds of engines.

By the summer of 1916 the deliveries under those various orders had become very backward, thus creating a serious condition of things, and in July Lieut.-Comdr. Neilson R.N.V.R., was sent out by the Admiralty to look into the matter. He returned the following month and made his report.

It was on his return that Lt.-Comdr. Neilson mentioned to witness certain things he had heard in reference to commissions being paid by the Curtiss Company in connection with Admiralty contracts, this being the first time the subject had ever been brought to witness's notice. Prior to that time witness had never heard of or seen Mr. Casson. He knew Mr. Seeley, however, who came frequently to the Admiralty, where he was recognised as the agent of the Curtiss Company, and most of the orders and communications to the company were sent through him.

Some time in the autumn of 1916 Casson called on witness and started talking about the Curtiss Company, saying he had been connected with it and was entitled to a commission from it, but he did not explain the nature of his connection with the company, nor the amount of his commission, nor the service for which he claimed it. Mr. Casson made reference on that occasion to Comdr. Porte, saying he had known him for many years, had been a kind of father to him, and had nursed him through some of his illnesses. Witness at that interview told Mr. Casson that he (witness) had nothing to do with the question of commissions, and that if he wanted to talk about such matters in connection with any firm he must see Sir Francis Hopwood, the Additional Civil Lord of the Admiralty, who was in charge of the Contracts Department. When speaking of his right to commissions, Mr. Casson made no mention of Comdr. Porte in that connection. Witness never told Comdr. Porte about his having been visited by Mr. Casson or that anything had been said about commissions, but he reported what he had heard to Sir Francis Hopwood.

About a fortnight after the interview with Mr. Casson witness received a visit from Mr. Seeley. To him he spoke straight out upon the subject of the commissions, and asked him who had them. Mr. Seeley replied that he, as agent for the Curtiss Company, had had a legitimate commission. Witness pressed him as to whether any officers of the Air Department had taken commissions, and he replied, "No, not a single one." Witness further asked him if he had given presents to any officer, and he replied that the only instance was that of a small wedding gift to one of the flying officers on his getting married. Mr. Seeley made no allusion to Casson or Porte, and said nothing as to the amount of what he had called his "legitimate commission."

Replying to Mr. Muir, Commodore Sueter said that in the earlier days of his acquaintance with Comdr. Porte, aviation was a more dangerous job than it was now; now it was about as safe or as risky as riding in a taxi-cab. Until witness left the Admiralty early in 1917 to go on active service, Comdr. Porte had been practically serving under him from September, 1914, in the technical work of his department, but he was not his commanding officer. During that period they met probably once or twice a week, and witness knew a good deal of Comdr. Porte's work.

Comdr. Porte was certainly a very highly-skilled officer, and witness had every confidence in his judgment, as he had very great air knowledge and advised extremely well. He had also every confidence in his integrity, and would accept his word absolutely. Before the war he was aware that Comdr. Porte had some business connection with the Curtiss Company; it was common knowledge that he was to attempt to fly these boats across the Atlantic, and it was not to be supposed he would do it for nothing.

The suggestion that the Admiralty should purchase the Curtiss flying boats came not from Comdr. Porte, but from witness, that was after he had heard Comdr. Porte's account of the performances. They discussed the boats and the possibilities of improving them. Witness and the head of the Contracts Department decided to negotiate the purchase of the boats through Comdr. Porte, as, he being so well-known to the firm, they considered it would save time, which was then of vital importance.

Comdr. Porte gave him a very fair account of the performance and capacity of the boats. It was after testing them that

was decided to offer more. Comdr. Porte was in favour of getting most of them built in this country, on account of the superior workmanship, but that was impossible at the time, as all the home firms were fully enployed on other military and naval work. When Comdr. Porte was appointed to the charge of the Felixstowe station in May, 1915, it was a comparatively small station, and the flying machines were rather antiquated from the present day point of view, though they were as good as could then be obtained. Felixstowe had now become an important station, with a great many more machines, more officers, and more men than in 1915. The type of boat had also been largely improved. That had all been done under the supervision of Comdr. Porte working in close contact with the Admiralty. The improvements had been largely due to Comdr. Porte's air knowledge and inventive skill.

As to whether the boats so improved by Commander Porte had been responsible for the destruction of a large number of enemy submarines and a few Zeppelins, that was a question he could not answer; the information would be best obtained from the Secretary to the Admiralty.

When witness relinquished the post of Superintendent of Aircraft Construction he wrote a letter (which was read to the Court by Mr. Muir) to Comdr. Porte, in which he thanked him for the highly valuable services he had rendered, and for the loyal support he had given him in his work.

Wing Commander Spenser Douglas Adair Grey, R.N., gave evidence as to going to America in November, 1914, to endeavour to expedite the output of machines then on order from the Curtiss Company. He came back with some of the machines, which were tested at Hendon and reported on favourably by witness to Commodore Sueter. He had from time to time met Mr. Seeley, but the latter never mentioned Mr. Casson to him, or made any allusion to receiving commissions on the Admiralty orders given to the Curtiss Company. The last time he met Mr. Seeley he noticed that he appeared to be living in more comfortable circumstances than formerly.

Lt.-Comdr. George Charles Neilson, R.N.V.R., was examined as to a visit he paid to America in July, 1916, in connection with the Curtiss Company's work for the Admiralty. In the following September he had a meeting at the Admiralty with Mr. Seeley, who made to him a rather involved statement respecting the division of a commission of 15 per cent. between himself and Mr. Casson. As far as witness remembered, Mr. Seeley's statement was that he himself took 7½ per cent., and Mr. Casson the other 7½, and that he (Seeley) had, in addition, a personal commission of 1 per cent.

Witness asked what Mr. Casson did to earn his 7½, and he replied something about Mr. Casson having conducted business with the Admiralty on behalf of the Deperdussin Aeroplane Company, and having put up some patents for the Curtiss Company, but the explanation was not clear. Mr. Seeley at the time appeared to be very nervous, and was almost incoherent. When witness asked him if there were any persons other than himself and Mr. Casson interested in the commissions he gave a negative reply. Mr. Seeley said, however, that Mr. Casson's knowledge of the Admiralty's methods of doing business was of great value to the Curtiss Company. Witness made some calculations and mentioned to Mr. Seeley what seemed to him the extraordinarily large amount of commission Casson was getting for doing nothing, whereupon Seeley became very indignant, and charged witness with making criminal accusations—bribery, etc.—against him and Mr. Casson.

The further hearing was adjourned till Friday next.

MR. GEORGE BERNARD SHAW ON AIR WAR.

Mr. George Bernard Shaw is credited in an interview which he has given to Mr. Arthur S. Draper, of the New York "Tribune," with the statement that "This war will be won in the sky and not in the trenches. All you have seen yet is an experimental rehearsal or two. Now that the experiment has succeeded—well, hadn't you better look after your gas mask and helmet? You will need them presently."

According to Mr. Draper, Mr. Shaw considers that air raids in which heavy casualties are inflicted have an important bearing on the result of the war. He says:—"All wars are decided by breaking through a military barrier and getting a bayonet or bomb against the brains and stomach of a nation as represented by the civilians of its capital.

"Give Sir Douglas Haig Berlin and Hindenburg may have Ypres and Albert and Bapaume and the rest of the western front. Give Hindenburg London, and Sir Douglas may as well pack his soldiers in boxes and sell them to the toy-shops.

"Which is more important—to protect the soldiers in the field or their women and children at home? And I'll ask another conundrum. What is more important—to protect the safe or the money inside of it? What's the soldier in the field for but to protect the child-bearing woman?

"Kill nine-tenths of our soldiers and male civilians and the remaining tenth can keep the population replenished. Kill nine-

tenths of the women, and the nation is dead, even if every dead woman were replaced by a live man. It is worth sacrificing a battalion to save half a dozen potential mothers." Asked his views on reprisals, Mr. Shaw replied :—

"Why should ordinary military operations be called reprisals? We don't call the great offensive at Arras a reprisal for the great offensive at Verdun. The bombardment of towns from the air is now as a much a matter of course in the war as the bombardment by siege guns from the ground.

"We have rained bombs on any German town we could get at, notably Freiburg, Treves, Karlsruhe—all charming residential towns with interesting historical monuments and valuable works of art, not to mention streets full of women and children.

"We publicly and officially claim to have dropped hundreds of bombs to every one dropped by the Germans, and we shall go on doing it until we force a decision."

A GENERAL IDEA.

Messrs. Claude Grahame-White and Harry Harper have produced another of the long series of books in which their names have been associated. The title of the latest production is "Air-Power, Naval, Military, Commercial."

The first section of the book deals with war by air in the past and in the future, and gives a very fair idea of the requirements of military aviation.

Part 2, on problems in construction, past, present and future, is an elementary disquisition on the why and wherefore of the aeroplane and its parts. Explanations being given of aerofoils, propellers, engines and so forth, and a general idea of the principles of construction in wood and steel is afforded the newcomer to the science.

The third section is devoted to our policy after the war, and stress is laid by the writers upon the necessity for Great Britain to lead the world in the matter of aviation. They advocate that the Government should subsidise the industry to make possible research into the increased possibilities of aircraft both for peace and war purposes.

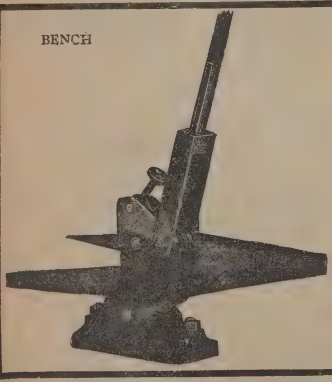
Part 4, entitled, "Factors of Safety," deals with the subject of aeronautical risks, not only with regard to scientific construction, but also to the problems of safe navigation, engine reliability, and provision of adequate landing grounds, and lighting as well as with meteorological conditions.

Section 5, "Popularising Travel by Air," deals with the subject of aerial touring in peace time and with the general cost and design of machines particularly suitable for this work. The subject of training aviators is also exhaustively discussed, and the subject of Flying Clubs receives attention.

Part 6 deals with the laws of the air, naval, military, international, civilian—a subject of purely academic interest in wartime, as, unfortunately, none of the belligerents have found it possible to conform with these laws in the letter, although attempts have been made to observe them in the spirit.

Part 7 discusses the commercial era of flying, where the aspect of the problem from a purely £ s. d. point is discussed, and here again the writers return to the necessity for Government encouragement to manufacturers to attempt to develop aeronautics in this direction.

The book is adorned with 20 full page plates showing typical aeroplanes built by the Grahame-White Co., and interior views of the Grahame-White Works. The frontispiece is a life-like portrait of Mr. Grahame-White. The lesson learnt by the authors of this work is set forth in the preface as follows :—"that in the future a nation which dominates the aerial highways will dominate also those of the land and sea; that a dominion of the air must mean, ultimately, the dominion of the world."



The book is likely to be quite useful to those desiring a general idea of aeronautical affairs.

WATER SPORTS.

A regatta was held on the Thames at Kingston on August 11th in aid of the East Surrey Regt. Comforts' Fund. The weather being fine, there was a large attendance, and as a result the promoters hope to realise something like £200 for the Fund. The principal event on the card was the eight-oared race, which was won by a Royal Flying Corps crew, stroked by Sec. Lt. A. M. Creswell, who defeated the Australian I.F. (Wattle Club). The latter, however, secured the Military Fours by beating the East Anglian Royal Engineers in the final. In the open fours the Sopwith B.C. proved too good for the Erignes R.C., while J. Spong and S. R. Cobb defeated Sergt. F. M. Stenning and Cpl. C. J. Stenning in the double sculls, H. R. Cobb winning the single sculls. In the officers' single sculls Capt. M. Leahy, a one-legged Australian officer, obtained a popular win over Lt. G. A. Olley, the old cycling champion. The military team race was won by a New Zealand team, the Royal Engineers (T) filling second place. The umpires in the rowing events were Messrs. C. W. Kent, the old Oxford and Leander stroke, and F. J. Bell, of the Kingston Rowing Club. Messrs. F. W. Maskell and W. C. Lamb were the judges.

Abroad, 3 months, 4s. 4d.; 6 months, 8s. 8d.; 12 months, 17s. 4d.

ON "PARAMOUNT AUTHORITY."

On Saturday last, the "Daily Express," a newspaper of very considerable circulation, put forward the somewhat startling proposition that the Right Hon. Jan Christiaan Smuts, K.C., late State-Attorney for the Orange Free State, and now Honorary Lieut.-General in the British Army, should be appointed to the sole command of "the united air service."

The "Daily Express" asks "Why should we have an Air Minister, a Naval Air Lord, and an Army Air Director, each apparently working in his own watertight compartment? Why not an air chief, with paramount authority over everything that flies, whether it is occupied by a man in the Navy's blue or in the Army's khaki?" After which comes the suggestion concerning General Smuts.

Dramatis Personæ.

Perhaps it may be well first of all to reply as briefly as may be to the questions of the "Express." In the first place, we have not an Air Minister—fortunately. We have in Lord Cowdray a very able president of a body known as the Air Board. Despite its telegraphic address that Board is not a Ministry, and it is earnestly to be hoped that it will not become a Ministry until such time as the Navy and the Army have settled for themselves the precise position within their own bounds of their respective Flying Services.

The Air Board exists for the purpose of increasing the output of aircraft, in which it is slowly succeeding. It also exists for the purpose of preventing competition in buying between the two Services, in which it has succeeded only too well, from the point of view of those who know that competition besides being merely good for trade is also essential to progress in design. It also exists to promote harmony between the two Services and the interchange of technical knowledge and experiences, in which it is succeeding quite as well as one would expect. It also exists to reconcile the demands by the Flying Services from the Ministry of Munitions with the demands of the older branches of the two Services, and here also it is succeeding to some extent. But it is not a Ministry in any sense of the word. It is a kind of cross between a conciliation board, an arbitration tribunal, a registry office, and Mr. Selfridge's Stores. Therefore, we have not got an Air Minister, and we do not particularly need one yet.

The Service Heads.

As regards the Naval Air Lord, he is a very necessary personage, and in our particular instance a very good one. A Naval Air Lord is needed to impress on their other Lordships of the Admiralty the value of a Naval Air Service, to instruct or advise them in the uses and capabilities of that Service, to administer and command that Service, and generally to represent the interests of that Service in the Board of Admiralty, consisting as it does of My Lords Commissioners for the execution of the office of the Lord High Admiral of this Realm. He has his own compartment in the affairs of the Navy just as the First Sea Lord deals with operations, the Second Sea Lord with appointments, promotion, and personnel, the Third Sea Lord with matériel, and so on. So long as the Navy uses aircraft, so long will an Air Lord be necessary.

As regards the Director-General of Military Aeronautics, whom the "Express" is pleased to call the "Army Air Director," he likewise is necessary to the Army, in the same way that his ten colleagues on the Army Council are necessary. So long as the Army employs aircraft, that arm must have a head, and that head is as necessary to the working of the Army as is any one of his ten colleagues on the Army Council, from the Chief of the Imperial General Staff down to the Director-General of Supply.

Watertight Compartments.

The "Express" apparently forgets that the whole government of England is based on the principle of decentralisation. The watertight compartments at which the "Express" seems inclined to mock are as necessary as are the watertight compartments of a liner or battleship. Centralisation, like a benevolent autocracy, requires a constant succession of genius. No section of the human race has, during the history of the world, been so fortunate as to find a supply of genius for more than a brief period.

Under a decentralised system, on the other hand, the absence of genius does not bring about general inefficiency of government. One watertight compartment may, for a time, carry on under a mediocrity without seriously affecting the parallel departments of the Government. It is only when, owing to bad design, there is delay in communication between watertight compartments when the ship of State is in full sail, that the system is open to objection.

Under a Julius Cæsar or a Napoleon Bonaparte centralised government may reach a state of transcendental efficiency, to which decentralisation cannot attain under any circumstances. Yet, as such men of genius are few and far between, it is better to ensure a constant high average of mediocrity than brief spasms of brilliancy sandwiched between long periods of comparative incompetence.

The Proposed Air Chief.

To turn now to that horrible apparition, "an air chief with paramount authority"—a phrase which conjures up dim visions of Fenimore Cooper, Major Griffiths, Gilbert and Sullivan, and transpontine melodrama. If we are to have an air chief—presumably merely because the air is a new force in warfare—then why not a petrol chief, to command all motor vehicles, on land, on sea, and in air, including cars, lorries, caterpillars, tanks, motor boats, liquid fuel ships,

motor-hauled railways, paraffin barges, aeroplanes and airships? Or why not a cook-general, to command the culinary personnel common to both Services in peace and war, because the stoking of the human machine is at least as important as any other branch of military operations?

Evidently the well-meaning people who still cry out for a unified Air Service have not yet grasped the idea that a sailor is a sailor and a soldier is a soldier, whether travelling by ship, train, horse, or aeroplane. Their technical training is different, their school education is different, they barely speak the same language. Each is entirely ignorant of the other's methods of operations, and even of the ranks of the other Service and of its words of command.

Certain elementary tactics are the same in both Services, just as naval or military aviators fight in the same way. But the higher training is entirely different in each. Therefore, why try to amalgamate two utterly diverse branches of Imperial Defence? A unified air service may sound well as a political cry, but it is absolutely opposed to naval and military needs, and to plain commonsense. One recognises, however, that commonsense and Service needs have nothing to do with politics.

The Third Service.

All of which, nevertheless, still leaves open to argument the possibility of forming a separate Air Service for aerial offence and defence entirely apart from Navy or Army. As has been pointed out many times in this paper, there are certain jobs of work which such a Service could do without reference to the Board of Admiralty or to the Army Council.

Air raiding into enemy territory would be the prime object of its existence. It could also undertake Home Defence without depleting the R.F.C. at the front and without keeping at East Coast stations R.N.A.S. units, which might be better employed on the high seas or on anti-submarine patrols round those parts of the coast where enemy air raids are never likely to occur.

Such a Third Service cannot possibly be formed until the needs of the Navy and Army are reasonably satisfied, but then it has possibilities. The nucleus of this Service could be formed by volunteers from the existing Flying Services, and probably the Senior Services would be quite willing to release such volunteers.

The Naval Air Service will doubtless in future desire that all its members shall be sailors first and "airmen" as a secondary consideration. Similarly the R.F.C. officer or man should be primarily a soldier who flies, and should regard soldiering as his life's work. Those who think more of flying than of naval or military science would be better out of their present Service, for they can never give themselves body and soul to their profession as they should do. Therefore, by all means, let them go to a Third Service which is concerned solely with air raiding and air fighting, without consideration of naval or military operations.

An Example from History.

This arrangement would introduce another watertight compartment into the Ship of State, with salutary effect, for, if either of the other Flying Services became inefficient, as it might easily do if it had a politically favoured mediocrity for its chief, there would at any rate be the two other Services to carry on two-thirds of the Empire's aerial war work efficiently. If the whole of this work were to be done by one unified air Service, under one paramount chief, the whole would fall to pieces if that chief proved inefficient.

We have only to look back to the history of the Flying Services in this war to see the truth of this argument. The Army at this moment owes its best fighting aeroplanes and its only real bombing machines entirely to the Navy, whereas if both Services had been under one paramount chief, relying, as the Director-General of Military Aeronautics did, on unfortunately-chosen technical advisers, both Services would perforce have been mounted on machines similar to those of which Major Baird, Parliamentary Secretary to the Air Board, said, "I do not deny that if they had other machines they would send them out in preference." There you have the perfect example of the result of centralisation under a paramount chief, and of the wisdom of having as much independent competition as possible to encourage progress in design.

General Smuts.

As to the suggestion that General Smuts should be the paramount chief in question, the subject is a trifle difficult to discuss. For General Smuts himself one has the sincerest admiration, despite the fact that, some seventeen years ago, he shared with the late President Kruger and General Louis Botha the same species of obloquy which the daily Press now exudes on the German Emperor, Field-Marshal von Hindenberg, and Dr. von Bethmann-Holwegg. General Smuts went on commando at the outbreak of war, and he came in after the Peace of Vereeniging, so he proved conclusively his ability to outwit our best Generals of that day.

Prior to the Boer War, he had had a very distinguished academic career in this country, and had shown legal ability to a high degree in his administrative work in South Africa. Thereafter, as a loyal subject of the King, he did excellent work in organising the defence forces of the Union of South Africa, and it is very largely due to his efforts that South Africa has contributed so valuably to our armies to-day

In the present war General Smuts has done work of high value. He aided General Botha in suppressing the initial rebellion in South Africa: and in East Africa, where he had a species of war for which his outstanding qualities peculiarly fitted him, he achieved remarkable success, despite enormous difficulties. Since then, in a civilian capacity in this country, having handed over his East African command, he has, one believes, been very valuable to the Government in an advisory capacity.

Nevertheless, one does not immediately perceive his precise qualifications for the post of "paramount chief of a unified air service." If South African war experience is a qualification, then General Henderson's work in the Intelligence Department in South Africa is likewise a qualification, though perhaps General Smuts scored more points in slimness on those occasions when these two distinguished officers were opposed to one another.

Military Needs.

On the other hand, General Henderson and other senior officers of the R.F.C., have had greater experience of pure and applied military science, and of that practical Army routine which is so necessary when a youthful arm such as the Royal Flying Corps has to be drilled into shape. If the "Daily Express" and those in high political places whence it may draw its inspirations are dissatisfied with Sir David Henderson, it is not difficult to suggest several other officers holding substantive rank in His Majesty's Army whose military experience and whose intimate and prolonged association with aeronautics fit them peculiarly to hold command of any new, or reformed, or unified air service which may come into being in obedience to political clamour.

Despite the valuable additions which both the existing Flying Services have received from our Colonies and Dependencies, they remain, and must always remain, integral parts of the Navy and Army respectively,

and it seems fitting that they should each be commanded by an officer whose whole career has been in the particular Service with which he is associated. It is certainly regrettable that so successful a fighting man as General Smuts should not hold a fighting command at the moment, and it is still more regrettable that he should be dragged into what appears to be a political manœuvre of some kind—he is too good a man to be wasted as a politician. Nevertheless, neither his particular kind of military experience and training, nor his personal connection with aeronautics, seems to indicate him as being pre-eminently suited to reform and command the Flying Services as definite branches of His Majesty's Navy and Army.

A Distinct Possibility.

If, however, General Smuts particularly desires to command an aerial force, or if his friends in the Government are earnestly desirous of finding him employment on active service away from the contaminating influence of English political circles, there is a distinct possibility for him as officer commanding a force of air raiders, similar to that which for a period operated on the Western German provinces. Such a force, properly equipped and supplied, and under a strong and ingenious commander of the stamp of General Smuts, might quite conceivably do useful work, provided the C.O. were given a free hand, entirely independent of the two existing Services.

He might be appointed to recruit and train his own personnel, with the assistance of volunteers from the present Services, and so his force might be the beginnings of that Third Service of which one has written hereinbefore. The said personnel might be recruited from adventurers and bushwhackers of all sorts who would not be acceptable in the Regular Army; it might become a kind of aerial *Légion Etrangère*. All those pilots who have left the R.F.C. owing to incompatibility of temper might be allowed or encouraged to join it. Antecedents need not matter; present pluck and skill need be the only thing to count. General Smuts would probably be perfectly happy while engaged in licking such a force into shape, and while directing its path to glory in Germany thereafter.

In such a way General Smuts would do good service to the Empire; he would earn further distinction, and he would find an outlet for his superabounding energy and driving power. Also, the progress of the existing Flying Services along those paths of strict routine which they were originally designed to follow would not suffer alteration at the whim of politicians, and so they might in time become worthy branches of those historic Services of which they have the honour to be the youngest arm.—C. G. G.

ON A CAMPAIGN OF SLANDER.

One of the first lessons I learned when endeavouring to acquire wisdom under my revered chief, the late Mr. William Iliffe, was that when a new paper desires to advertise itself one of its best games is to start abusing an older paper in the hope of decoying it into a controversy, and thus into giving the new paper a free advertisement. Probably no group of papers have been so roundly abused by minor contemporaries as those founded by the firm of Iliffe, and probably no papers have done less to gratify and advertise their abusers by entering into controversy with them. I take it rather as a compliment that sundry minor contemporaries of The Aeroplane have for some time afforded me opportunities of profiting by that lesson.

It is only necessary for me to refer to the matter now because papers with small sales frequently cultivate a large free list. Some of my friends in the Services and in the Aircraft Industry have been good enough to send me from time to time copies of papers, which I should not otherwise have seen, containing attacks on me personally and on The Aeroplane as a newspaper, and it seems only courteous to thank them for their trouble in sending these copies. Doubtless if they apply for further free copies, the publishers of the articles will be pleased to replace those sent to me.

This seems also a good opportunity to apologise to many readers for the difficulty they experience in obtaining The Aeroplane. The restrictions imposed on

THE MISFORTUNE OF WAR.—A group of British Officers of both Flying Services in enemy hands at Karlsruhe. The absence of leather boots is noticeable. These are apparently appropriated by the original captors of the prisoners.

the supply of paper make it necessary to limit strictly the number of copies printed weekly, and so the news-agents find it impossible to keep a quantity of copies in readiness for casual sales. Nevertheless, the paper can always be had by placing definite orders with news-agents, or by subscribing for copies to be delivered by post.

Notwithstanding this forced limitation of the number printed, the sales of The Aeroplane are greater than those of any other aeronautical paper, and correspondents who complain that other papers can be obtained on bookstalls when The Aeroplane cannot may fairly safely assume that all copies of this paper have been bought up, and the others left. There is no need for anyone to go without The Aeroplane if he or she will make up his or her mind to order it for regular delivery.

However, to return to my various assailants, there are so many things of real importance to be discussed at the moment that space and time are alike lacking in which to argue with those few whose positions, apart from the medium of their assault, make them worth o argument. Among the latest are Messrs. Hilaire Bello and F. W. Lanchester, both gentlemen of considerabl weight, whose combined onslaught ought, one admits to call for correspondingly stout resistance. Both, how ever, detract from their momentum by being so irresist ibly humorous, that they suggest rather the solemnly comic rolling of the push-ball than the overwhelmin rush of the avalanche.

It is too hot and stuffy here in Town to deal with them in the spirit which their attack deserves, an attack al the more humorous in that both the assailants seem t take themselves and it quite seriously for once. How ever, as I have promised myself a day or two in th country, when certain really serious matters have dis closed in which direction they are developing, I ma then find time in which to jape with the new Tweedl Dum and Tweedle-Dee of aerial controversy.—C. G. G

AIR RAID WARNINGS.

Sir William Nott-Bower, Commissioner of Police for the City of London, has issued the following notice in connection with attempted air raids over the area under his jurisdiction :

When, from information received from the military authorities, an air raid upon London is considered probable, the following steps will be taken for giving warning to the public to enable them to take cover :

In the City of London, two sound signals (rockets) will be fired in succession from fire brigade stations, so selected as to cover the area to be warned.

Simultaneously with the firing of the rockets regular and special constables on foot and on cycles will circulate throughout the streets exhibiting a "Take Cover" placard (red letters).

When the military intimate that the air raid is over, regular and special constables will be sent out, exhibiting an "All Clear" placard (black letters), and calling attention to their presence by sounding the bells of their cycles, or by sounding their whistles—two blasts in quick succession.

The public are warned that the cover taken should be effective; a doorway or open archway is not effective cover, as from a bomb exploding in a street close by protection would not be afforded. Persons in buildings are advised to keep away from the windows as far as practicable, and to vacate the top floors.

* * *

After the statement by the police at the Southend raid inquest that the siren warning was stopped by the London authorities, a conference of burgesses of the borough, representing all classes, was held. Local Members of Parliament will be approached with a view to an inquiry being held.

In 1915, after the first Zeppelin raid, an arrangement was made to sound a siren in the event of approaching hostile aircraft. On the next occasion, owing to misunderstanding between the police and the borough officials, the siren was not sounded until after all danger had passed. Apparently after that the practice was discontinued.

Since then repeated efforts have been made by the inhabitants to have some system of air raid warning installed, but the authorities on each occasion have refused to entertain the proposal. Only last week petitions were being publicly signed throughout the borough suggesting the kind of signal best suited for the locality, but by the irony of fate the town was raided one day before the list was due to close.

[It will probably be found that the stoppage of the siren took place long ago, before the defence of England was organised on the present system, and that it is entirely Southend's own fault that it has not been resumed. There was excellent reason for stopping sirens which could be heard in an airship floating about in the dark with its engines stopped, but that reasoning does not apply to aeroplanes in any case, still less in broad daylight.—Ed.]

BUSINESS AS USUAL.

From the "Daily Express" of August 18th :—

There is a certain grimness in a letter from a City firm which came into my hands, in which they say, "Referring to the air raid of June 13th, in which our old offices were destroyed and my partner and half our staff killed, we now beg to inform you that we have now settled down at the above address." There is a typically British directness about this "carrying-on" which it is good to take to heart.

AERO-ENGINE SUPPLIES.

In view of the urgent demand for increased aero-engine, or aero-engine parts, production, as supported by the maximum priority given to this class of work, it is of the greatest national importance that any firms who consider they are in a position to render assistance should write to the Controller of Aeronautical Supplies, Room 355, Air Board Office, Strand, W.C.2.

AERIAL TORPEDOES.

So many people write asking whether the weapons called aeria torpedoes in the daily press operate in the same way as wate borne torpedoes, that it seems worth while to make it plain tha there is really no such thing as an aerial torpedo. The thing usually called aerial torpedoes are merely rather large bombs o a torpedo shape, which, as they have less head resistance tha ordinary "pudding" bombs, fall faster and have greater pene tration. They are evidently intended to go through several floo of a large building and blow the whole thing to pieces instead o simply exploding on the roof and doing little harm.

The idea of an aerial torpedo in the strict sense, that is say, a small aeroplane, automatically controlled, carrying a bi explosive charge—but without anybody on board—has been sug gested many times, but it is evidently useless when one conside that such a machine would be drifted off its course by the win and consequently would go anywhere except to the objective fo which it was intended.

As the modern long range gun can fire absolutely accurate up to a range of twenty miles and can be directed onto its targ by an artillery observation aeroplane, so that every shell w fall inside a 50-yard circle, there is no object in the aerial torpe idea.

There is also a species of "aerial torpedo" which is fired fro a trench mortar. This is simply a large fat bomb with thin likes vanes stuck on its tail, so as to make it travel more or le straight. It has apparently been largely used in trench fightin in the wooded districts of Central France, but one has not hea of it lately on the West front. It also is not an aerial torpe in the proper sense.

A SLIGHT MISUNDERSTANDING.

A report from Amsterdam on August 7th, reproduced in th "Express" on August 8th, seems to demonstrate German in perviousness to irony. An article in the "Cologne Gazette contributed by a high officer, relates in all seriousness, as a pro of the efficacy of the U boats, that during the recent fighting Flanders British aviators dropped a fly-sheet stating : "As yo Ludendorff rightly observes, we unfortunately lack ammuniti at present owing to the U boat war. We hope within a fe weeks to change this."

The writer adds : "We Germans at the front know, as well Germans at home, that this hope will prove illusory."

SIMPLE AND EFFECTIVE.

The Newcastle City Council on August 13th approved measur for giving warning of aircraft raids by utilising tramway se vices. If the raid should be at night the current will be inte rupted and resumed after a minute and then finally cut off. the event of a daylight raid the current will be cut off and a r flag displayed on each car.

THE KING'S COMMISSION.

BY "BERKELEY."

A letter has been received by the Editor of this paper dated the 8th of this month, and written, it would appear, by some non-commissioned officers of the Royal Flying Corps. They say:—

"Dear Sir,—Enclosed please find cutting from your paper. We have underlined two passages, and beg to point out, after some years' experience of the R.F.C., that men who are not mentally or socially fit for commissioned rank are certainly not fit for N.C.O. rank.

"We suggest that more brains are required to be an N.C.O. in the R.F.C. than most people imagine, also mental effort is very much required in a non-commissioned officer. One would think from 'Berkeley's' article that the R.F.C. commissioned officers were the only people who had mental or moral fitness.—Yours truly, SGTS. OF AN R.F.C. SQUADRON."

The two passages underlined are in an article of mine dealing with a possible future of the Royal Flying Corps, and suggesting that an intricate knowledge of "the practical art of flying" is not in itself a sufficient qualification for admission to the commissioned ranks of the military flying service.

It would perhaps be proper to ignore entirely an anonymous letter of this type, written, as it is, by non-commissioned officers of some years' standing, who still, it would appear, spell the word "serjeant" with a "g." Nevertheless, as it is possible that other non-commissioned officers may inadvertently have taken offence at phrases which, if carelessly read, might reflect on the efficiency and credit of their class, it is well for me to indicate the particular qualifications and duties which are expected from those who desire to hold the King's Commission.

The Great Misunderstood.

There is no class in the Empire so little understood by the general public as is that of the professional Army officer. In pre-war days he was appreciated as a brilliant ornament giving colour to a drab world on such occasions as it was necessary for him to make a public and official appearance. He was, according to ill-informed scandal, an unerring authority on the manners and the methods of the racecourse, an ardent supporter of the Divorce Court, an accomplished consumer of disguised alcohol, and a debonair villain of the piece in all the incidents of the common day.

To others equally unacquainted with the Army he was a charming slacker possessed of princely skill in the games of his class and country, and a member of a jealous caste entirely lacking appreciation of the stock-broker and the journalist, those stalwart buttresses of the realm of England. He spent his own money and his own time in the service of his King, whilst they with equal enthusiasm spent other people's savings that the pen might possess more horror than the sword.

In time of war he died gallantly enough for the same critics to be jealous of the grim and unsought advertisement that hovers for a space over the sealed grave.

Such was an only too common a view of the days of peace and war before the present contest began its history. The public, perhaps because they have known the newer officer a little more intimately, are more tolerant, and are willing to admit his power of filling the casualty lists that are in these days the only things of truth permitted in the daily Press.

The Need for Deeper Knowledge.

But a greater recognition is necessary, and a deeper knowledge should be possible. Class distinctions, which have in error been made the barrier beyond which sympathy could not penetrate, are less intense in the Army than in perhaps any other profession. That a man should be a gentleman is a high recommendation, but it is not essential that he should be so by hereditary right. Tact is the great essential. With that and efficiency there is no obstacle on the ladder of military progress.

The first thing necessary of an officer is that he should be capable of leadership when he himself has learnt the secret of obedience. There is too little recognition of the fact that an officer's main duty is to command.

The Officer's World.

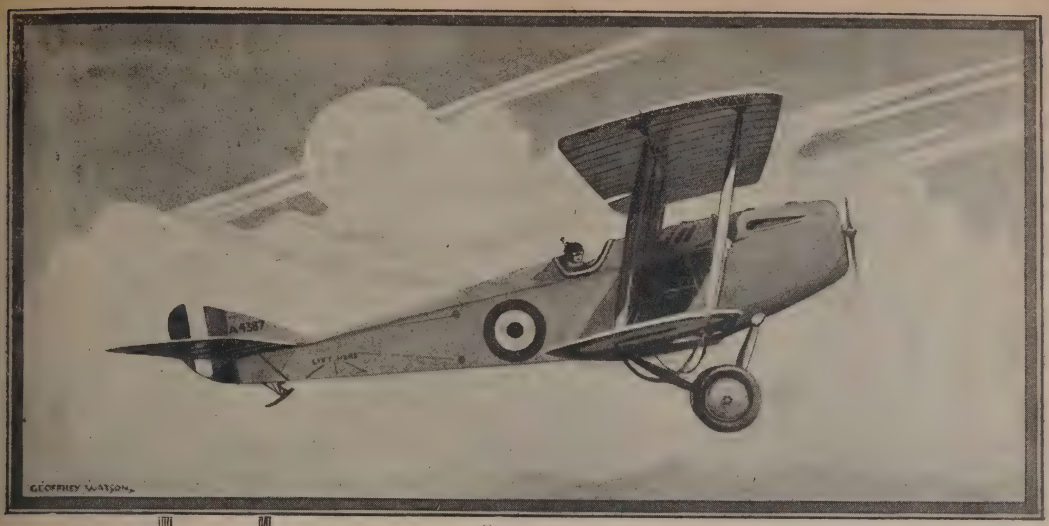
That he may be qualified to do this, he must be trained in a manner specially ordained for the purpose. He must learn that his own personal interest is a small thing compared with the general good of the great service in which he is a necessary part. His King, his brother officers, and his men are the entire world to him. Politics and their miry intricacies are not for him, nor is he obliged to take note of the wishes of statesmen unless they are embodied in an order from his military chiefs.

The great difference between the commissioned officer and those beneath him lies in the responsibility which is so large a part of his life. His responsibility never ceases throughout all his progress through the service.

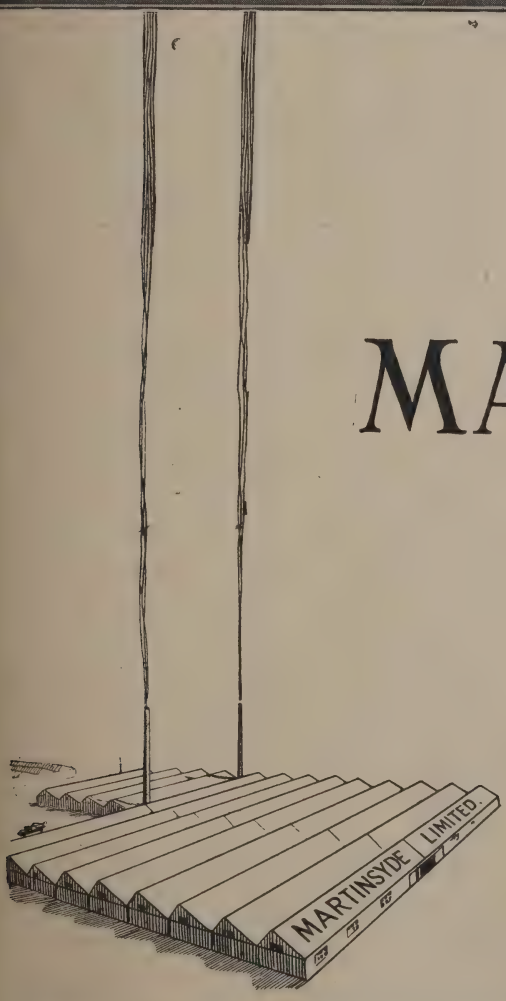
The Soldierly Spirit.

It is the officer who must by example ensure that the rank and file under his command shall become imbued with the most soldierly spirit of the age. He must show them the things that can be done, and those that are to the perfect soldier a thing apart. He should have no priggish reservations, but he should appreciate the manner of living that has made such soldiers as Sir John Moore and Sir James Outram an undying memory in military history.

To him falls the duty of so training his men that under all conditions they will be capable of responding to the demands made upon them. A dirty soldier or an inefficient soldier is more disgraceful to his officers than he is to himself. An officer who complains habitually of the material given him to be turned into soldiers worthy of upholding ancient tradition is indicating with painful clarity his own unfitness for the King's Commission.



Theoretic and Practical Knowledge.



If he is to train soldiers to the required degree, he must himself possess a thorough knowledge of the duties and responsibilities of his rank. No blind man could ever lead another blind man through the intricacies of a strange country. Complete theoretic and practical knowledge of those things which it is necessary for the men to know is essential.

It is not to be inferred from this that a company officer should endeavour to rival Karl von Clausewitz in strategical knowledge or Sir John Cowans in powers of administration before he can teach his men the alphabet of the military life. He should possess a full understanding of the work he has in hand, and expand his knowledge as his duties and responsibilities increase.

The Value of Games.

It is not only a knowledge of the technique of war that is required of an officer. He must be skilled in those games which, despite Mr. Kipling, have done so much in creating the best side of the national character.

SBAC
THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Men in barracks, well fed, not greatly overworked, and with money to spend, are always in danger of selecting the simplest road to pleasure. Loafing and the saloon bar have their attractions for the soldier as well as for the worker in civil life. The nymphs and dryads proper to the pleasaunce of Hyde Park in the twilight hours do not practise their seductions in vain when the idle soldier passes through their realm.

The keen officer may do much to prevent such a condition becoming constant. By personal effort, aided not a little by personal prowess, he can fill the empty hours with sport capable of developing the best characteristics of the race. But a true devotion to the men's interests is very necessary if the highest results are desired. If appointments are to be broken, it is better for an officer to disappoint any intimate personal friend who may desire his presence at lunch or dinner than to cause one moment's unhappiness to his men. If he has promised to do anything with them, his word must be kept in the letter and in the spirit. Duty alone can be a good excuse.

Responsibility.

In the field an officer's responsibility increases, and his work in the past is put to the test. In his power are the lives of many men, and perhaps the destiny of the Empire may turn on the manner in which he does his duty. He does not know, he cannot know, but his course is simple if his training and his practice are good. He must at all times remember that on his efforts and those of his men as an essential part of the King's forces there is laid a heavy burden of duty.

He must before considering his own comfort see that his men are in a position to get such food and rest as may be possible. In the trenches he must be a constant example of cheeriness and resolution, and in the rest camp he must lead in the provision of amusements.

For the King.

He fights for his King and all that royalty implies. He does not juggle with meaningless inchoate words, such as "liberty" or "freedom"—words which have throughout history inspired the worst passions in man. The specious platitudes of the delirious phrase-makers who accuse him of fighting for "Right" against "Might" have no meaning for him. He knows that in truth he is fighting because his King requires it.

That all officers do not regard their duties in sufficiently serious a light in no way weakens the argument. There are drones in every hive. The inherent caddishness of many young officers commissioned at the present time should encourage the others to increased effort in their lives and duties.

The Soul of an Officer.

Neither efficiency nor intellect can make an officer worthy of the name unless in addition the true spirit is present. The Army is no profession for the hours of work alone. Those who become soldiers must devote their entire time to its life. In work and play the effort is always made primarily for the good of the service. The soul of an officer as well as his body must be in and of the Army.

Perhaps my non-commissioned officer critics of the Royal Flying Corps will admit that special qualifications are necessary in the ideal officer, and that vigour of intellect is not the only standard of propriety.

These remarks apply equally to officers of all arms in the service. In the case of the flying officer there is no local responsibility such as is involved in the care of a platoon in the field, but on him rests the higher responsibility that on his honesty and skill in aerial reconnaissance may depend the fate of an army and the lives of thousands of men.

THE S.B.A.C.

The Second Annual General Meeting of the Society will be held at the Lounge Room, Caxton Hall, Westminster, S.W., on Wednesday, August 29th, 1917, at 4 p.m. The Annual Report and Accounts for 1916 have been sent out to Members.

A Council Meeting of the Society will be held immediately following the General Meeting.

IMBECILITY OR HYPOCRISY.

From the "Daily Chronicle" of August 15th:—

There is considerable indignation in Southend at the absence of warning in Sunday's raid, and following a public meeting a procession demonstrated before the residence of the mayor.

Some light on the position was thrown at yesterday's inquest on the 32 victims. Inspector Baker (who saw hostile aeroplanes approaching at 5.55) said the police had received notice to take air raid action at 5.22. This was done by means of communicating with the branch police stations, the fire stations, the hospital, and the railway station, and the public were warned by word of mouth through the various officials.

A juror, who asked why the sirens were stopped, was told by a police witness this was done because in the case of a raid on a Midland town the siren actually directed the hostile craft, and the blowing of the siren was discontinued in Southend because of the request from headquarters in London.

The jury in their verdict expressed the opinion that the raid was inexcusable, owing to the complete absence of anything of military importance in Southend, and the fact of it being carried out in open day. They could understand the almost inexpressible bitterness felt by the relatives, and strongly recommended that more adequate warning be given.

[Air raid warnings, outside the London area, are supposed to be left entirely to the judgment of the local authorities, so it would seem that Southend has only itself to blame. The idea of a siren being heard by people sitting beside two howling 260-h.p. engines, 15,000 ft. above it, would be excruciatingly funny if it did not throw such a glaring light on the imbecility of local authorities. Just why an air raid should be inexcusable in open day is not quite clear, especially when one remembers that not so long ago papers were calling the Germans cowards for attacking under the cloak of darkness. Verily, we are either a nation of imbeciles or of blatant hypocrites, probably both.—Ed.]

REPRISALS.

In an article dated from the Western front on July 28th, and entitled "An Eye for an Eye: a Tooth for a Tooth," Herr Karl Rosner supplies the Berlin "Lokalanzeiger" with a description of the German method of reprisal against French aviators for alleged ill-treatment of German aviators by the French. The "Times" of August 13th says that it will be remembered that Herr Rosner has achieved special fame in the description of German atrocities—not only in the matter of the Corpse Utilization Factory, but in the glorification of the German devastation of France. He writes:—

"I lately visited one of the French aviators in his quarters. On an extensive moor, formerly a French aviation ground, are placed, at a certain distance from one another, the enclosures in which the prisoners are confined singly. Each enclosure measures about forty square yards, is surrounded by posts over 6 ft. 6 in. high, and is secured by barbed wire. In the middle of the uncovered space is a low tent, just big enough for the prisoner to creep under it. Under the tent are a few wood shavings and a short blanket. A jug of water completes the furniture. A sentry with fixed bayonet is allotted to every prisoner by day and night.

"The officer to whom I spoke had spent five days and five nights in his reprisal camp. . . Thus far the man has stood his open-air imprisonment well, although, of course, he complains of the endlessness of the days and nights, of the lack of any occupation, and of the impossibility of taking proper care of his person."

The inimitable Herr Rosner takes care to explain "how little reprisals accord with the German way of thinking in war, and how very revolting it is for the Germans to practise severity against defenceless prisoners."

[One would like to have a full and accurate account of this affair, for Herr Rosner may be turned on officially to exaggerate such stories in the hopes of making the reprisals more effective. If true, this method of punishment will merely increase the account which the Germans will have to settle with France after the war.—Ed.]

* * *

The Secretary of State for War has received the following list of names of officers, non-commissioned officers and men whose services have been brought to notice by Lt.-Gen. Sir Stanley Maude, K.C.B., Commander-in-Chief, Mesopotamian Expeditionary Force, as deserving of special mention:—

Royal Naval Air Service.

Cassy, Flt. Lt. A. W.; Lyon, Flt. Sub-Lt. M.; Verey, Lt. D. R., R.N.V.R.; Wrottesley, Comdr. F. R., R.N.

Brennan, F.7736 Air Mech., 1st Gde., T.; Cowton, Ply. 13554 C.P.O., 2nd. Gde., A. E.; Cracknell, F.8912 Ldg. Mech. C. L.; Freeman, F.4667 Ldg. Mech. R. C.; Veale, F.9262 P.O. Mech. A. H.; Ward, F.9274 Ldg. Mech. P. H.; Young, F.9291 Air Mech., 1st Gde., E. W.

Royal Flying Corps.

Bayly, Lt. (temp. Capt.) L. J., R.A.; de Havilland, Capt. (temp. Maj. in Army) H., D.S.O., R.F.C., Spec. Res.; Forsyth, Sec. Lt. (temp. Lt.) W. A., R.A.; Hawker, Lt. T. McD., R. Ir. Fus.; Herring, Lt. (temp. Maj. in Army) J. H., D.S.O., M.C., R.F.C., Spec. Res.; Macfarlane, Sec. Lt. R. M. C., R.A.; Merton, Lt. (temp. Capt. in Army) G., M.C., R.F.C., Spec. Res.; Moxey, temp. Lt. E. R.; Rattray, temp. Lt. A. R.; Tennant, Bt. Maj. (temp. Lt.-Col.) J. E., M.C., S. Gds.; Tullis, temp. Lt. (temp. Capt.) W. W., Gen. List.

Ayling, No. 11687 (local Sgt.) S. B., Wilts R. (now No. 78877, R.F.C.); Coates, No. 1676 Flt. Sgt. W. A. H.; Deacon, No. 77481 Cpl. H.; Evans, No. 3983 Sgt. P. W.; Gardner, No. 14170 Cpl. G.; Keil, No. 5551 1st Air Mech. F.; Vaile, No. 1651 Flt. Sgt. A.; Walton, No. 4161 Sgt. F.

War Office, August 16th.

REGULAR FORCES.—The following N.C.O's. and men to be temp. Sec. Lts.:—The A.S.C.—Cpl. F. W. Southgate, from R.F.C.

Memorandum.—For duty with R.F.C.—Sgt. H. S. Starling, from R.F.C., June 25th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Sqdn. Comdrs.—From Flt. Comdrs., and to be temp. Majs. whilst so empld.:—Sec. Lt. (temp. Capt.) A. M. Vaucour, M.C., R.A., May 1st. Capt. C. E. Bryant, D.S.O., Hrs., July 9th.

Adjts.—And to be temp. Capts. (without the pay or allowances of that rank) whilst so empld.:—Lt. W. A. Knox, Canadian Art.; Sec. Lt. M. A. Seymour, Spec. Res., from a Flying Officer, July 1st.

Equipmt. Officers, 1st Cl.—From the 2nd Cl., and to be temp. Capts. whilst so empld.:—Lt. J. W. Yuile, Canadian Inf.; temp. Lt. H. B. Denton, Gen. List; Lt. B. V. Grealy, Spec. Res.; Sec. Lt. (temp. Lt.) H. E. Earl, Rif. Brig., Spec. Res., from an Asst. Instr. (graded as an Equipment Officer, 2nd Cl.), School of Mil. Aeronautics, and to be temp. Capt. whilst so empld., July 1st.

Gen. List.—The following from R.F.C., to be temp. Sec. Lts.: 1st Cl. Air Mech. N. B. Arbuthnot; 1st Cl. Air Mech. W. A. Golding; 2nd Cl. Air Mech. H. Sinclair; 1st Cl. Air Mech. C. F. Straughan, May 17th.

* * *

The King has been pleased to approve of the appointment of the following Officer to be Companion of the Distinguished Service Order in recognition of his gallantry and devotion to duty in the Field:—

Australian Imperial Force.

Capt. Richard Williams, Flying Corps.

Flying at a low altitude under intense anti-aircraft fire, he attacked and dispersed enemy troops who were concentrating on our flank. On another occasion, whilst on a reconnaissance, he landed in the enemy's lines and rescued a pilot of a machine which had been brought down by hostile fire.

* * *

The King has been pleased to award a Bar to the Military Cross to the following Officers:—

Temp. Lt. William Arthur Bond, M.C., Yorks L.I. and R.F.C.

While on patrol he attacked at close range a hostile machine, which was sent down out of control. Shortly afterwards he attacked another, which stalled and fell sideways. On another date he flew over the lines at about 50 ft. and attacked a hostile balloon, bringing it down in flames. (M.C. gazetted June 24th, 1916.)

Sec. Lt. William Charles Campbell, M.C., R.F.C., Spec. Res.

He has repeatedly shown great fearlessness and skill in attacking and destroying enemy aircraft, on one occasion destroying three within one hour. He has also attacked and dispersed enemy troops from a low altitude, at all times showing the utmost disregard of personal safety. (M.C. gazetted in this "Gazette.")

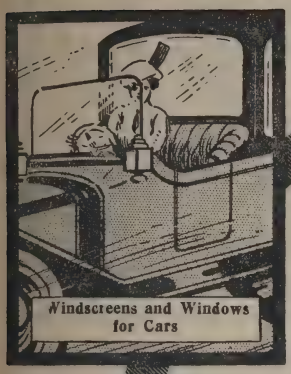
Lt. (temp. Capt.) William John Charles Kennedy-Cochran-Patrick, M.C., Rif. Bde. and R.F.C.

For conspicuous gallantry in attacking hostile aircraft. Within two months he brought down two hostile machines in flames, and four others completely out of control. In addition he has driven several others down in a damaged condition. (M.C. gazetted May 16th, 1916.)

* * *

The King has been pleased to confer the Military Cross on the following Officers in recognition of their gallantry and devotion to duty in the Field:—

Sec. Lt. William Charles Campbell, R.F.C., Spec. Res.



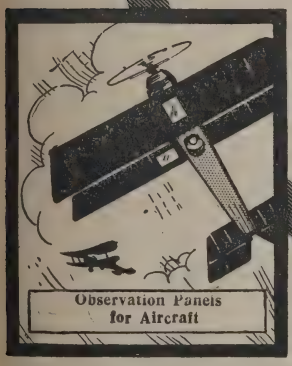
He attacked an enemy balloon, bringing it down in flames, and returned to our lines at about 20 ft. from the ground under heavy fire. On another occasion he attacked and dispersed a column of infantry from a very low altitude. He has shown great courage and initiative throughout.

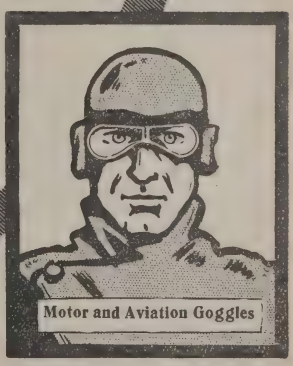
Temp. Sec. Lt. Roy Maxwell Drummond, R.F.C., attd. Aust. C.

With another officer he attacked and disorganised six enemy machines that were about to attack our cavalry with bombs. The engagement was continued until all six machines were forced to return to their lines. His skill and courage on all occasions has been worthy of the greatest praise.

Temp. Lt. Dudley Charles Eglington, R. Highrs. and R.F.C.

For conspicuous gallantry and devotion when acting as an observer. In the course of a fight with several Albatros scouts, in which he shot down one, the pilot was wounded and fell over the control lever insensible, causing the machine to dive with





The Wonderful Properties

of Triplex Safety Glass have made it a commercial necessity in every branch of automobile and aeronautical engineering. Absolutely unsplinterable; cannot "fly" if broken, and yet is as clear as plate glass.

TRIPLEX
SAFETY GLASS

the engine full on. He climbed out, standing outside the fuselage on the lower plane, dragged the pilot back, and switching off the engine, pulled the machine out of its dive. Not being a trained pilot, his act exhibited great fearlessness and skill.

Temp. Sec. Lt. (temp. Lt.) William Mayes Fry, Gen. List and R.F.C.

Diving to a very low altitude, and under heavy fire he emptied all his ammunition into the retreating enemy. During the last month he has brought down four hostile machines. He has done consistent good work as a pilot.

Temp. Sec. Lt. Cuthbert Colin Gemmill Girvan, Lanc. Fus. and R.F.C.

When on patrol he flew for 2½ hours at a height of 500 ft., gaining and dropping valuable information at Headquarters. Although severely wounded and fainting from loss of blood, he handed in his report before finally collapsing.

Temp. Lt. Louis Fleeming Jenkin, Gen. List and R.F.C.

Whilst on offensive patrol he has continually shown the greatest dash and determination in attacking enemy aircraft in superior numbers, destroying some and bringing others down out of control.

Temp. Capt. Arthur Willan Keen, Gen. List and R.F.C.

He has shown the greatest gallantry and skill in aerial fighting, and his daring in leading offensive patrols into favourable positions for attack has been the means of many hostile aircraft being destroyed and driven down.

Sec. Lt. (temp. Capt.) John Herbert Towne Letts, Linc. R. and R.F.C.

He attacked four large two-seaters, driving two down out of control and forcing the remaining two down. He has helped to destroy eight machines, and throughout has set a splendid example.

Temp. Sec. Lt. George Frederick Lines, Gen. List and R.F.C.

He rendered valuable assistance to our artillery by locating a hostile battery, descending to a very low altitude. On his return he attacked hostile infantry, inflicting many casualties. On many other occasions he has displayed similar fearlessness in attacking and bombing hostile wiring parties, infantry, and ammunition dumps.

Sec. Lt. Evans Alexander McKay, R.F.C., Spec. Res.

For conspicuous gallantry and devotion to duty in making valuable photographic reconnaissances under heavy hostile fire. His work whilst engaged on reconnaissances and patrolling has at all times shown a fine offensive spirit, notably in flying at low altitudes and engaging hostile troops with his machine-gun.

Sec. Lt. Alfred Seymour Shepherd, R.F.C., Spec. Res.

While on balloon attack he came under heavy fire from a rocket battery. He attacked this battery from a low altitude, silencing it, and dispersing the gunners. He then returned to the attack on a balloon, and fired all his ammunition, and though his machine was badly hit, crossed the line at 100 ft.

* * *

The King has been pleased to award the Military Medal for bravery in the field to the following men :—

13990 1st Cl. Air Mech. C. F. Nesbitt, R.F.C.
65519 2nd Cl. Air Mech. W. H. Poole, R.F.C.
8853 2nd Cl. Air Mech. L. Spicer, R.F.C.

* * *

The King has been pleased to award the Meritorious Service Medal to the following warrant officers and non-commissioned officers in recognition of valuable services rendered with the Armies in the field during the present war :—

5046 Sgt. E. C. Chapman, R.F.C.
1676 Flt. Sgt. W. A. H. Coates, R.F.C.
213 Temp. Sgt.-Maj. C. T. Davies, R.F.C.
77481 Sgt. H. Deacon, R.F.C.
120 Actg. Sgt.-Maj. W. Sharp, R.F.C.
1651 Flt. Sgt. A. Vaile, R.F.C.

AMENDMENT.

The following is the correct description :—

Lt. (temp. Capt.) J. G. Selby, M.C., R.F.A. and R.F.C. (M.C. gazetted July 26th, 1917), upon whom the Military Cross has been conferred.

WAR OFFICE, August 17th.

REGULAR FORCES—ESTABLISHMENTS.—R.F.C.—MIL. WING.—Sqdn. Comdrs.—From Flt. Comdrs., and to be temp. Majors whilst so empld. :—Temp. Capt. F. M. Ballard, Gen. List, March 16th. Sec. Lt. (temp. Capt.) A. K. Tylee, Spec. Res., March 21st. Sec. Lt. (temp. Capt.) G. H. Bonnell, R.F.A., Spec. Res., April 24th. Lt. (temp. Capt.) J. S. Scott, M.C., Canadian Art., June 18th. Capt. J. R. McCrindle, M.C., Gord. Highrs., T.F., August 1st.

Capt. A. M. Wilkinson, D.S.O., Hamps. R., T.F., from a Flt. Comdr., and to be temp. Major whilst so empld., May 10th. (Substituted for the notification in the "Gazette" of July 20th.)

The following Majors (temp. Lt.-Cols.) revert from Wing Comdrs., and relinquish their temporary rank :—G. B. Stopford, R.A., July 30th, seny. Sept. 5th, 1915. F. J. L. Cogan, R.A., August 4th, seny. July 12th, 1915.

Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld. :—Sec. Lt. (temp. Lt.) N. Howarth, R. Lan. R., Spec. Res., July 1st. Temp. Lt. L. F. Jenkin, Gen. List, July 31st. Lt. C. J. Orde, A.S.C., Spec. Res., August 1st. Lt. A. P. D. Hill, R.A., August 4th. Sec. Lt. F. H. Holdsworth, Spec. Res., August 5th.

Capt. (temp. Maj.) P. E. L. Gethin, Spec. Res., reverts from Sqdn. Comdr., and relinquishes his temp rank, July 27th, seny. Feb. 10th, 1916.

Instr. in Gunnery (graded as an Equipment Officer, 1st Cl.).—Temp. Sec. Lt. (temp. Lt.) J. C. C. Affleck, Gen. List, from an Asst. Instr. in Gunnery (graded as an Equipment Officer, 2nd Cl.), and to be temp. Capt. whilst so empld., July 1st.

Balloon Co. Comdr. (graded as a Flt. Comdr.).—Lt. (temp. Capt.) R. C. Talbot, R.F.A., T.F., from a Balloon Comdr. (graded as a Balloon Officer), July 10th.

Depot Comdr.—Capt. (temp. Maj.) M. D. Methven, Lond. R., T.F., from a Park Comdr., and to be temp. Lt.-Col. whilst so empld., July 1st.

Park Comdrs.—From Equipment Officers, 1st Cl., and to be temp. Majors whilst so empld. :—Temp. Capt. T. F. G. Strubell, Gen. List; Sec. Lt. (temp. Capt.) C. R. Huggins, Spec. Res., July 1st.

Special Appt. (graded as a Park Comdr.).—Sec. Lt. (temp. Capt.) W. R. Willis, Ind. Army Res. of Officers, from an Equipment Officer, 1st Cl., and to be temp. Major whilst so empld., July 16th.

Equipment Officers, 1st Cl.—Sec. Lt. (temp. Lt.) B. F. Crane, Spec. Res., from the 2nd Cl., and to be temp. Capt. whilst so empld., May 1st.

TERRITORIAL FORCE.—R.E.—Capt. (temp.) (temp. Maj., R.F.C.) A. ap Ellis to be Capt., prec. Feb. 3rd, 1915, and to remain secd., August 18th.

* * *

The King has been pleased to confer the Military Cross on the following Officers in recognition of their gallantry and devotion to duty in the Field :—

Sec. Lt. (T. Capt.) William Robert Sargent Wilberforce, K.R.R.C., attd. R.F.C.

During a bomb attack on our lines by hostile aircraft he attacked them single-handed, although they were superior to him in speed, and after a running fight destroyed an enemy machine. His skill and courage throughout nine months' operations have been worthy of the highest praise.

Sec. Lt. Arthur Mostyn Wray, E. Kent R. and R.F.C.

While on an offensive patrol he attacked a hostile two-seater at close range. He was at once severely wounded, and though his thigh was fractured and his machine fell several thousand feet, out of control, he managed to obtain control again and effected a safe landing. He has previously done splendid work.

Sec. Lt. Adrian Trevore Cole, Flying Corps.

With another officer he attacked and disorganised six enemy machines that were about to attack our cavalry with bombs. The engagement was continued until all six machines were forced to return to their lines. His skill and courage on all occasions have been worthy of the greatest praise.

* * *

The King has been pleased to approve of the award of the Distinguished Conduct Medal to the following non-commissioned officers and man, for acts of gallantry and devotion to duty in the field :—

22025 Sgt. R. O. Campbell, R.F.C.
54267 Sgt. C. R. L. Falcy, R.F.C.
53352 2nd A.M. J. H. Holdershaw, R.F.C., attd. R.G.A.

WAR OFFICE, August 18th.

REGULAR FORCES—ESTABLISHMENTS.—R.F.C.—MIL. WING.—Flt. Comdrs.—Temp. Lt. E. H. Tatton, Gen. List, from a Flying Officer, and to be temp. Capt. whilst so empld., August 1st. Capt. (temp. Maj.) R. M. Vaughan, M.C., R. Innis. Fus., reverts from a Sqdn. Comdr., and relinquishes his temp. rank, August 4th, seny. March 28th, 1915.

Depot Comdr.—Capt. (temp. Maj.) H. Burchall, Spec. Res., from a Park Comdr., and to be temp. Lt.-Col. whilst so empld., June 1st.

Park Comdrs.—From Equipment Officers, 1st Cl., and to be temp. Majs. whilst so empld. :—Lt. (temp. Capt.) S. S. Nevill, Spec. Res., July 5th. Lt. (temp. Capt.) H. F. T. Blowey, R.A.; temp. Capt. E. R. Bond, Gen. List; temp. Capt. R. C. Lane, Gen. List, August 1st.

OVERSEAS CONTINGENTS.—CANADA.—CAN. INF. BNS.—Temp. Capt. R. W. Bruce, from Can. Gen. List, to be temp. Capt., and is secd. for duty with the R.F.C., August 8th, 1915.

WAR OFFICE, August 20th.

Comdr., to relinquish his temp. rank and to be temp. Capt. whilst so empld., August 4th, seny. Jan. 8th, 1916.

Balloon Co. Comdrs.—(Graded as a Sqdn. Comdr.).—Lt. (temp. Capt.) J. R. Bedwell, R.G.A., T.F., from a Balloon Co. Comdr. (graded as a Flt. Comdr.), and to be temp. Maj. whilst so empld., August 5th. (Graded as a Flt. Comdr.).—Sec. Lt. (temp. Lt.) C. M. Down, Herts R., T.F., from a Balloon Comdr. (graded as a Balloon Officer), and to be temp. Capt. while so empld., August 5th.

Equipment Officers, 1st Cl.—From the 2nd Cl., August 1st.—Capt. T. H. Vitty, R.E., T.F. And to be temp. Capts. while so empld. :—Sec. Lt. (temp. Lt.) G. E. Upton, Spec. Res.; Sec. Lt. (temp. Lt.) J. O. Ruscoe, Spec. Res.; Sec. Lt. (temp. Lt.) E. I. David, Spec. Res.; Sec. Lt. (temp. Lt.) B. M. Iles, Spec. Res.; temp. Lt. P. R. Callard, Gen. List, from the 3rd Cl., and to be temp. Capt. whilst so empld., August 2nd. Sec. Lt. (temp. Lt.) R. N. Vyvyan, Spec. Res., from the 2nd Cl., and to be temp. Capt. whilst so empld., August 16th.

Gen. List.—Sgt.-Maj. H. Lawson, from R.F.C., to be temp. Sec. Lt., June 22nd.

SCHOOLS OF INSTN.—Central Flying School.—Instrs.—Sec. Lt. (temp. Capt.) A. M. Vaucour, M.C., R.A., a Flt. Comdr., vice Capt. C. G. Bell, Spec. Res., Jan. 23rd. Temp. Lt. (temp. Capt.) (Sec. Lt., Res. of Officers), Lord G. H. L. Dundas, Gen. List, a Flt. Comdr., vice Lt. (temp. Capt.) D. A. L. Davidson, M.C., Spec. Res., Feb. 11th. Temp. Capt. H. Barker, Gen. List, a Flt. Comdr., vice Sec. Lt. (temp. Maj.) L. A. Tilney, R.H. Gds., March 15th. Capt. G. Allen, Conn. Rang., a Flt. Comdr., vice Sec. Lt. (temp. Capt.) T. Davidson, Cam'n Highrs., T.F., May 1st. Sec. Lt. (temp. Capt.) A. H. O'H. Wood, Spec. Res., a Flt. Comdr., vice Capt (temp. Maj.) F. G. Small, Conn. Rang., May 4th. Lt. (temp. Maj.) R. Balcombe-Brown, M.C., R.F.A., Spec. Res., a Sqdn. Comdr., vice temp. Capt. H. Barker, Gen. List, June 17th. Capt. R. H. Freeman, M.C., Worc. R., Spec. Res., a Flt. Comdr., in succession to Sec. Lt. (temp. Capt.) A. H. O'H. Wood, Spec. Res., July 8th. Graded as an Equipment Officer, 1st Cl. :—Sec. Lt. (temp. Lt.) S. McClure, N. Staff. R., Spec. Res., from an Asst. Instr. (graded as an Equipment Officer, 2nd Cl.), and to be temp. Capt. whilst so empld., July 28th.

Officer in charge of Workshops.—Sec. Lt. (temp. Capt.) E. L. P. Morgan, Spec. Res., an Equipment Officer, 1st Cl., Aug. 1st.

Schools of Mil. Aeronautics.—Asst. Comdt.—(Staff Officer, 2nd Cl., graded as a Brig. Maj.).—Maj. P. E. L. Elgee, R. Berks. R., vice temp. Capt. F. A. Forde, Gen. List, July 19th.

Memorandum.—Lt. (temp. Capt.) C. A. Hooper, Spec. Res., to be temp. Maj. (without the pay or allowances of that rank) whilst comdg. an Aircraft Acceptance Park, July 2nd.

FROM THE COURT CIRCULAR.

Windsor Castle, August 15th.

The following Officers had the honour of being received by His Majesty, when the King invested them with the Insignia of Companions of the Orders into which they have been admitted :—

Bar to the Distinguished Service Order.

Comdr. Charles Samson, R.N.

The Distinguished Service Order.

Lt.-Col. John Chamier, Indian Infantry and R.F.C.

His Majesty then conferred decorations as follows :—

The Distinguished Service Cross.

Sqdn.-Comdr. Tom England, R.N.A.S.

The Military Cross.

Capt. Stanley Aitken, R.G.A. and R.F.C.
Capt. Richard Ward, Royal Welsh Fusiliers, attd. R.F.C.
Sec. Lt. G. Burkett, R.F.C.
Sec. Lt. Sydney Jones, S. Lanc. Regt. and R.F.C.
Sec. Lt. John Ralston, Scottish Rifles, attd. A.F.C.

NAVAL.

The following appointments have been made in the Royal Naval Air Service :—

August 15th.—Mr. E. W. M. Wheldon granted a temp. commission as Lt. (R.N.V.R.), seny. August 12th.

August 18th.—Flt. Comdr. (Proby.).—M. C. Brotherton, confirmed in rank of Flt. Comdr., July 18th.

Flt. Sub-Lt.—E. B. Devereux, promoted to rank of Flt. Lt., seny. May 18th.

Messrs. H. F. Mercer and J. T. Taylor, both entered as Lts. (temp.), R.N.V.R., seny. August 17th.

August 20th.—Proby. Flt. Comdrs.—W. Pennefather and G. G. H. Cooke, both confirmed in rank of Flt. Comdr., seny. July 4th.

Admiralty Communiqués.

August 17th.—A series of raids were successfully carried out yesterday (16th inst.) by the Royal Naval Air Service. Many tons of bombs were dropped on the following military objectives :—

Ostend railway station and sidings.

Thourout railway station and junction (about 11 miles east-north-east of Dixmude).

Ghistelles aerodrome (about five miles south-south-east of Ostend).

Several fires were observed.

Attacks were also made by gunfire from the air on Engel (about half-way between Ghistelles and Thourout) and Uytkerke (about one mile inland from Blankenberghe) aerodromes and on road transports.

All machines returned safely.

August 18th.—Another bombing raid was carried out at about midnight, 16th-17th, by the Royal Naval Air Service on the Thourout railway station and junction (about 11 miles east-north-east of Dixmude). Fires were caused, and it is thought that an ammunition dump was hit and the railway damaged. Many tons of bombs were dropped on the objective.

All machines returned safely.

August 20th.—Many tons of bombs were dropped during the night of the 18th-19th inst. by the Royal Naval Air Service on the following military objectives :—

(a) St. Pierre station and sidings, Ghent.
(b) Thourout station and dump (about 11 miles east-north-east of Dixmude).
(c) Bruges docks.

A bombing raid was also carried out yesterday morning (August 19th) on Snelleghem (about five miles south-west of Bruges) aerodrome, where a direct hit was made on a large shed.

On their return our machines were attacked by hostile aircraft, which were beaten off with the help of a Royal Flying Corps patrol.

One enemy machine was shot down out of control; all our machines returned safely.

The Casualty List.

Reported August 16th.

Killed.—Wykes, A. V. (accidentally), Aircraftsman, 2nd Gde., F.31501.
Died of Wounds.—Currington, S., Air Mech., 1st Gde., F.1375.

Reported August 17th.

Accidentally Killed.—Bray, Proby. Flt. Officer R. E., R.N.
Wounded.—Brock, Flt. Sub-Lt. C. G., R.N.
Slightly Wounded.—Burton, Flt. Sub-Lt. S., R.N.
Injured.—Dolman, Flt. Sub-Lt. F. W., R.N.
Slightly Injured.—Carter, Proby. Flt. Officer B. R., R.N.
Previously reported Missing, now reported Prisoner.—Holcroft, Flt. Sub-Lt. A. B.

Reported August 18th.

Previously reported Missing, now reported Killed.—Blagrove, Flt. Lt. C. R., R.N.

Reported August 20th.

Accidentally Killed.—Forman, Proby. Flt. Officer L. E., R.N.
Arnold, Flt. Lt. C. V., R.N.
Missing.—Lloyd, Flt. Sub-Lt. S. H., R.N.
Baron, Flt. Sub-Lt. M. N., R.N.
Gray, Flt. Sub-Lt. A. T., R.N.
Slightly Injured.—Smyth, Flt. Sub-Lt. G. H. G., R.N.
Wounded.—Garland, Flt. Sub-Lt. A. H., R.N.
Slightly Wounded.—Saint, Flt. Lt. H. J. T., R.N.
Previously Missing (Believed Prisoner), now reported Prisoner.—Nash, Flt. Sub-Lt. G. E., R.N.
Previously reported Missing, now reported Prisoner.—Kent, Flt. Sub-Lt. R. L., R.N.
Previously reported Missing, now reported Killed.—Roach, Flt. Sub-Lt. H. L., R.N.
Smith, Flt. Sub-Lt. H. L., R.N.

Reported August 21st.

Missing.—Strathy, Flt. Sub-Lt. F. S., R.N.
Wounded.—Abbott, Flt. Sub-Lt. R. F. P., R.N.

PERSONAL NOTICES.

Deaths.

BLAGROVE.—Flt. Lt. Cecil R. Blagrove, R.N., whose name appeared in the official list of Aug. 18th, was reported missing on Feb. 7th, 1917, and is now reported killed on that date. He was 20 years of age and was the only son of Mr. and Mrs. Stanley Blagrove, of 170, Kingston Road, Wimbledon, and was in his 21st year. At the outbreak of war he was at King's College School. He had been in France about a year and lost his life while on a bombing raid on Bruges harbour. His commanding officer writes :—"He was one of the most gallant officers who have ever

served under me, and incurred all our admiration by the coolness and thought with which he carried out all his operations. He took every risk willingly in the cause of his country."

FORMAN.—Proby. Flt. Officer Leonard Eales Forman, R.N., who died on August 16th, 1917, as the result of an accident whilst flying, was the only son of A. Frank Forman and Ellen Forman, late of Gordon Road, Ealing, W. He was 19 years of age.

WOODHOUSE.—Flt. Sub-Lt. Mosley Gordon Woodhouse, R.N., who was killed while flying on August 9th, was the second son of Arthur and Isobel Woodhouse, Tofts, Little Baddow, Essex. He was 18 years of age. He left Radley to join the R.N.A.S. in October, 1916, when just 18, and went to France in June last. He made a wonderful effort to land when in flames at 7,000 ft., and got within 100 ft. of earth, when the machine broke up, and he was killed.

MARRIAGE.

LEAGE—HIGHLEY.—On August 18th, at St. Jude's-on-the-Hill, Hampstead, Flt. Sub-Lt. Leonard W. Léage, R.N., was married to Beatrice M. Highley, only daughter of Mr. and Mrs. Highley, Finchley Road, N.W., by the Rev. B. Bourchier.

BIRTH.

GROVES.—On August 15th, at Two Gables, Beaconsfield, Bucks, the wife of Capt. R. M. Groves, D.S.O., R.N., of a daughter.

Flt. Sub-Lt. Donald W. Ramsay, R.N., who has been missing since July 7th, was last seen fighting behind the German lines. His relatives are anxious for information as to his fate, and communications will be gratefully received by Mr. N. D. Ramsay, The Grange, Alnmouth, Northumberland.

MILITARY.

G.H.Q. Communiqués.

August 14th, 9.5 p.m.—The enemy's aircraft continued to pursue aggressive tactics yesterday and attacked our long-distance bombing machines with great vigour. Our machines, none the less, reached and successfully bombed their objectives in every case. Artillery and photographic work was carried out throughout the day by our machines, and machine-gun fire was opened with effect upon the enemy's infantry, both in their trenches and in the open.

In air fighting seven German aeroplanes were brought down and four others were driven down out of control.

Two of our machines are missing.

August 15th, 9.45 p.m.—There was great activity in the air again yesterday, and severe fighting took place, in the course of which nine German aeroplanes were brought down and five others driven down out of control.

Seven of our aeroplanes are missing, two of which were overtaken by a violent storm when working over the enemy's lines.

August 16th, 10.5 p.m.—Throughout yesterday's attack our aeroplanes co-operated successfully with our artillery and infantry, and assisted effectively with machine-gun fire in repelling the enemy's counter-attacks.

In air fighting 11 German aeroplanes were brought down and four others were driven down out of control. In addition, one hostile machine was brought down by our anti-aircraft guns.

Three of our aeroplanes are missing.

To-day also our aircraft have done excellent work.

August 17th, 10.1 p.m.—There was great activity in the air yesterday and fighting was severe.

Although a strong west wind made it difficult for damaged machines to regain our side of the lines, our aeroplanes had greatly the better of the fighting, and were able to carry out their tasks successfully in spite of determined efforts on the part of hostile aircraft to interfere with their work.

Our activities commenced before dawn and were continued uninterruptedly throughout the day.

Hostile aerodromes were cleared with machine-gun fire from a height of a few score feet, and a total of six and a half tons of bombs were dropped on the enemy's aerodromes, railway stations, and billets.

Other machines directly assisted our infantry in their attack, harassing the German infantry and gunners with machine-gun fire and directing the fire of our artillery upon concentrations of German troops.

Fifteen hostile machines were brought down by our aeroplanes, and 11 others were driven down out of control.

One German observation balloon also was brought down in flames.

Eleven of our aeroplanes are missing.

August 18th, 9.20 p.m.—The strong west wind yesterday again told against our aeroplanes, giving machines damaged in combat east of the line little chance of reaching their aerodromes. Bombing raids and the policy of harassing the enemy's infantry with machine-gun fire were actively continued by us. Observation for our artillery was carried out all day and an unusually large number of photographs were taken.

In air fighting 12 German aeroplanes were brought down and 18 driven down out of control.

Twelve of our machines are missing, two of which collided during a fight and fell within the enemy's lines.

August 19th, 10 a.m.—On the nights of the 16th and 17th inst., enemy aircraft bombed British casualty clearing stations. Ten wounded German prisoners were killed and nine wounded German prisoners were again wounded by the German bombs.

9.7 p.m.—Strong westerly winds prevailed again yesterday. The activity of our aeroplanes was continued, and bombing raids and artillery and photographic work were carried out successfully throughout the day.

In air fighting 3 German aeroplanes were brought down and 4 others were driven down out of control.

Eight of our machines are missing.

August 20th, 8.55 p.m.—Yesterday hostile aircraft worked in large formations well behind their own lines and endeavoured, without success, to hinder the work of our bombing, photographic, and reconnaissance machines. Our bombing operations were continued. An enemy train was wrecked and much damage was caused to hostile aerodromes, dumps, and stations. Work in co-operation with our artillery was carried out with good effect, and many photographs were taken.

In air fighting two German aeroplanes were brought down and four others driven down out of control. One other enemy machine was shot down in our lines by anti-aircraft guns.

Six of our machines are missing.

[A total of 49 machines missing in the week.—Ed.]

* * *

War Office Communiqué.

August 15th.—The G.O.C. the British Forces in Macedonia reports:—

Our aeroplanes have bombed the aerodromes at Livunovo (south-east of Petric), Drama (Struma front), and Gereviz (south-east of Xanthi) with good effect. All our machines returned safely.

The Casualty List.

Reported August 15th.

Wounded.—St. Clair, Lt. L. F. C., Lancers, attd. R.F.C.

Australian Force.—Missing.—Wearne, Sec. Lt. L. A., F.C.

Reported August 16th.

Wounded.—Budden, Lt. G., R.E., attd. R.F.C.
Hawgood, Sec. Lt. W. P., R.F.C.
Penny, Sec. Lt. A. R., R.F.C.

Missing.—Ellam, Sec. Lt. H. J., R.F.C.

Indian Force.—Previously reported Missing, now reported Prisoner in Bulgarian Hands.—Leslie-Moore, Lt. A., I.A.R.O., attd. R.F.C.

New Zealand Force.—Wounded.—Hirschberg, Capt. J., A.S.C., attd. R.F.C.

Reported August 17th.

Died of Wounds.—Dennett, Sec. Lt. T. F. P. T., R.W. Surr. R. and R.F.C.

Reported August 18th.

Killed.—Marshall, Sec. Lt. D. E., W. Yorks R., attd. R.F.C.

Died of Wounds.—Day. Sec. Lt. H. J., Glouc. R., attd. R.F.C.

Wounded.—Adams, Sec. Lt. F., R. Fus., attd. R.F.C.
Coleman, Capt. F. H., R.F.C.
Jerrard, Sec. Lt. A., S. Staff. R. and R.F.C.

Previously reported Missing, now reported Killed.—Webb, Sec. Lt. T., R.F.C.

Previously reported Missing, now reported Killed.—Prisoners in German Hands.—Kirkham, Sec. Lt. F. J., R.F.A., attd. R.F.C.
Newenham, Sec. Lt. G. A., R.F.C.

Previously reported Missing, now reported Prisoner in German Hands.—Coles, Lt. W. T., Oxf. and Bucks L.I., attd. R.F.C.

Canadian Contingent.—Wounded.—Revill, Capt. J. A., Inf., attd. R.F.C.

Reported August 20th.

Killed.—Cutler, Capt. S. Le G., A.S.C., attd. R.F.C.
McMurray, Sec. Lt. S., Lond. R., and R.F.C.
Pillow, Sec. Lt. H. M. S., Mx. R., R.F.C.

Died of Wounds.—Fendall, Sec. Lt. D. J., R.F.A., attd. R.F.C.

Wounded.—Bathurst, Sec. Lt. A. A., D. of Well. R., attd. R.F.C.
Gibson, Sec. Lt. E. V., R.F.C.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The British Aircraft Industry.

BY CHARLES L. FREESTON.

XXV.—GWYNNE'S LIMITED.

With an essential difference, the aeroplane problem is just as much an engine problem as ever. Time was when nothing was available that was either powerful enough or within measurable distance of trustworthiness; but if nowadays we have engines that are big enough and of very much improved quality, the question of production has become paramount under war-time conditions.

Wings and fuselages may be produced with commendable celerity, but may then have to lie idle until delivery can be obtained of the engines themselves, and in the end may have to be equipped with something of inferior or less powerful design that happens to be available.

What was Lacking.

At this time of day it is almost a work of supererogation to point out that a very different state of affairs would have prevailed if greater foresight had been displayed by the powers that be in the matter of placing larger orders for engines of the right kind. In the way of rising to the occasion the manufacturers themselves have by now worked wonders, and a remarkable example of enterprise and unbounded energy in the direction of rapid development is that of Gwynne's Limited, of Hammersmith and Chiswick, who are the chief producers in this country of the Clerget rotary motor.

Early Initiative.

Founded some seventy years ago, the firm was engaged at the time the war broke out in the manufacture of centrifugal pumps for the Admiralty at Crisp Road, Hammersmith. The Clerget motor, however, was introduced to the notice of Mr. Nevile G. Gwynne, the managing director of the company, and in Oct., 1914, he acquired for the firm the whole patent rights of the engine for the British Empire, and proceeded to manufacture it as soon as arrangements to that end could be completed. As a matter of fact, Gwynne's Limited were the first British firm to embark upon the production of aircraft engines since the war began.

For various reasons it was desirable to obtain new premises and new machinery, and works, which for long were famous in river annals, were acquired and set going on the completion of an Admiralty order for a number of Clerget engines.

New plant, of course, had to be installed, as the machines in use at the Hammersmith factory were too heavy for the purpose in hand. Even thus early, moreover, the task had to be faced of training existing or new employees to the new class of work.

Mr. Nevile G. Gwynne.

A Big Order.

A very much stiffer problem, however, was presented in June of last year, when an order was received for engines of large weekly deliveries. The sheds had to be converted into workshops of the completest and most modern kind, both structurally and in respect of the laying down of a most extensive and elaborate plant, while electric power had to be laid on from Hammersmith. The new works were shortly transformed out of recognition by those who knew them in the old days, and may now be regarded as among the finest in the country of those which are exclusively engaged upon the production of aircraft engines.

Already the output is enormous, but is still capable of expansion, and the spectacle which a tour of the establishment affords is eminently cheering to all who are anxious to see the British aircraft industry, in all its branches, placed upon a footing commensurate with the needs of the movement, where the war is concerned, and of such developments as will arise after peace has been declared.

A Remarkable Spectacle.

There are several noteworthy features of the new works which at once strike the beholder. One is the amazing *coup d'œil* afforded by the machine and tool-shops, which are nearly all under one roof, without intervening partitions, and cover a floor-space that can only be described as colossal in extent.

The method of distribution, moreover, is interesting, as the plan of arrangement is not in accordance with the class of work done, but with the types of machines employed. There is not, for example, a cylinder-room or a crankcase-room; the classification is such that each bay is not known by its process, but by what it contains—milling machines, bar-drawing machines, or whatever the case may be.

The amount of new plant that has been laid down is remarkable, not only as to its extent and cost, but also as to the fact that it has been laid down and set in full working order in so short a time, in these days of shortage of skilled labour.

Women Workers.

And even as to the work itself, everyone has had to be taught his or her job, even the foremen themselves. Great success,

by the way, has attended the firm's pioneer efforts in the enrolment of women workers, who now number something like fifty per cent of the total. This is an extraordinary fact in itself, when it is borne in mind that the works are entirely devoted to such eminently mechanical work as engine-building, the engine in question, too, being a complicated product which comprises over twelve hundred separate parts. None the less, the women may be observed engaged in skilled work which only a short time ago would have been regarded as altogether outside their scope.

An Example to be Followed.

There is even one department in which the work is performed entirely by women; it is the room in which the air pumps for the Clêrget motors are made, and, in contradistinction to the general plan of the works, is run as a self-contained affair. As such it has been quoted by the Ministry of Munitions as a model of what can be accomplished, and an example to be followed, in the way of utilising women's labour on mechanical work.

The output of the various bays is regulated by the progress department, which keeps in touch with every branch of work and employs a number of women, distinguished by green uniforms, whose duty it is to make inquiries in every section.

Twenty-two Operations.

The viewing methods are also very thorough. In the making of the Clêrget cylinder there are no fewer than 22 different machine operations, and each one is viewed in passing before the next stage is entered upon. In this way considerable savings are effected, as a part that has to be "scrapped" is condemned forthwith instead of the fault being discovered after further work has been expended upon it fruitlessly.

Thoroughness, in fact, is the key-note of every department of the works, and its culmination may be found in the stores, where every part of the engine has its sequence number, and is interchangeable. Some of the parts are also interchangeable with Le Rhône and Gnôme engines. Already the stores are well furnished with spare parts.

A Marvellous Development.

So great is the demand for Clêrget engines that the pump works at the Hammersmith factory are almost entirely shut down, and they are devoted to feeding the Chiswick works. High pressure centrifugal pumps for the front are still being produced at Hammersmith.

The two factories together employ an amount of labour which would probably provide food for surprise if the actual figures were to be stated, and present a scene of war-time activity which is little short of marvellous when it is reflected that the reorganisation and enlargement were only undertaken in the latter half of 1916.

The Clerget Motor.

Of the Clêrget engine itself it is impermissible, of course, to say anything as to its newest phases. All those in touch with the flying Services will know what good services it has performed particularly on Sopwith machines. A word may be said, however, as to its earlier history for the benefit of newcomers into the aviation world. It first attracted notice at the Paris Aero Show of 1910, when two examples were exhibited. One was a vertical 50-h.p. four-cylinder model, and the other an eight-cylinder "V" type of 200 h.p., the latter being probably the most powerful aircraft motor produced up to that date.

The 50-h.p. seven-cylinder rotary motor appeared at a later date, and was used with success on the Deperdussin and Nieuport machines, and in October, 1912, M. Janois used it in a flight of 2½ hours. It had a bore of 120 mm., with a 120 mm. stroke, and weighed 200 lbs. It used 4.75 gallons of petrol and one gallon of oil per horse-power. In September, 1913, its inventor, M. Clêrget, a mechanical genius who was chiefly interested in experimental work, was joined by M. Blin, of the well-known automobile firm of Malicet et Blin, and the new partnership of Clêrget, Blin et Cie. distinguished itself by the production of an 80-h.p. engine and subsequently a 110-h.p. model of great effectiveness. On an 80-h.p. Henri Farman biplane, in December, 1913, M. Testulat climbed 1,000 metres in 12½ minutes, carrying a useful load of 300 kilogs.

The well-known 130-h.p. nine-cylinder model, the dimensions of which are 120 mm. by 160 mm., has, of course, placed innumerable fine performances to its credit at the front. But of what can be accomplished with a good engine of even smaller type, when the combination includes a good machine, a good pilot and a good observer, it may be mentioned that an 80-h.p. Sopwith enjoys the record of bringing down fifteen Hun machines within 24 hours.

SOME WORKS MAGAZINES.

The August number of "The Highflyer," the unofficial organ of the Norman Thompson Flight Co., Ltd., of Bognor, has duly arrived, and the energetic ladies who edit it are to be complimented on their efforts, especially as they managed to produce it before the August holiday so as to give purchasers a chance of thinking over their sins without the distraction of the workshop. "The Highflyer" does not set out to be severely technical or even to confine itself strictly to aeronautical matters, but it is, none the less, readable for all that. The contents range between "The Enlisting of a Shover," to a beautiful poem entitled "The Gift," which, after two verses of the real article in poetry, suddenly presents one with the fact that the gift is that priceless jewel, a pound of sugar. The first impressions of a New Chum at the Works is really an excellent effort. The Editresses will be pleased to receive copies of other Works Magazines.

The "B.P. Magazine" (the house organ of Boulton and Paul, of Norwich) for July is No. 1 of Volume 2. Congratulations to the Editor on having completed the first volume. The magazine keeps up its high standard of excellence and rivals any technical magazine in its practical information. The third of a series of very good notes on timber, by Mr. W. G. Flood, is published in this number. The Competition Page, conducted by Mr. G. C. Clayton, continues to be highly educative, and one only wishes that one could reproduce many of the hints and tips therein. Unfortunately, to do so would very probably assist the enemy by giving him new ideas in the production of aircraft.

The July "Joy-Stick" continues the series of articles on Avro Milestones, and also the sketches of the types of aeroplanes we may build after the war. The July type is apparently a desert patrol very similar to the old totally enclosed Avro. It seems that the duty of this machine is to search uncharted parts of the desert in search of lost travellers from trade routes. Rather an ingenious idea this, but one doubts whether the number of such stray travellers would be worth the cost of the petrol expended in searching for them. The August issue, also to hand, is of the usual local interest.

A NUMBER TO BE NOTED.

The Aircraft Industry will do well to note that the telephone number of the Sopwith Aviation Co., Ltd., Kingston-on-Thames, is now changed to Kingston 1988. This number embraces 6 lines, and therefore there should be no difficulty in communicating with the firm.

Head Office and Works - - - WOLVERHAMPTON

An American Training Machine.

The Standard Model "J-R" Military Training Tractor, with Hall-Scott 175-h.p. motor.

The Standard Model "J-R" is one of America's recent productions in the way of an advanced training machine. It is similar in general form to the Standard Model "J" Military Preliminary Training Tractor. The 90-h.p. motor has been replaced by a special Hall-Scott 175-h.p. motor, and the R.A.F. No. 3 wing curve has been superseded by the U.S.A. No. 6, illustrated recently.

Some leading features of the "J-R" model are as follows :—

(1) The two-wheeled steel landing gear combines lightness with strength and is perfectly streamlined throughout so as to offer a minimum of head resistance. On landing, the axle rises in vertical guides, and when normal rests in a U-shaped steel case streamlined with aluminium.

(2) All wing struts are provided with ball and socket fittings.

(3) An auxiliary fan, driving the gear fuel-pump, projects out from the fuselage, and pumps the fuel from the main tank to the gravity tank.

(4) The engine-bed is made very rigid by means of steel tube stays which connect the ash engine supports to the longerons.

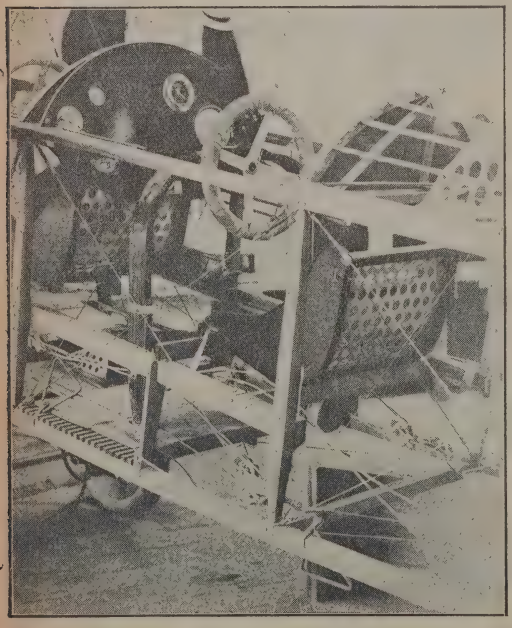
(5) There is a single control of the Dep. type in the rear cockpit.

(6) The radiator is mounted over the motor and is free from vibrations. It strikes one, however, that it produces immense head-resistance.

(7) There is a single complete manifold for the exhaust.

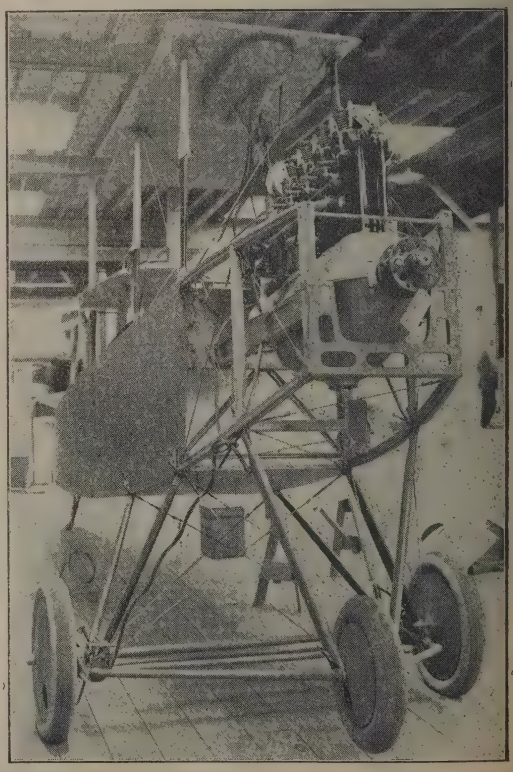
(8) The exhaust pipe leads the gases over the top plane.

(9) Throughout the entire machine, the weight has been kept down and yet none of the strength or air-worthiness has been impaired.



GENERAL SPECIFICATIONS.

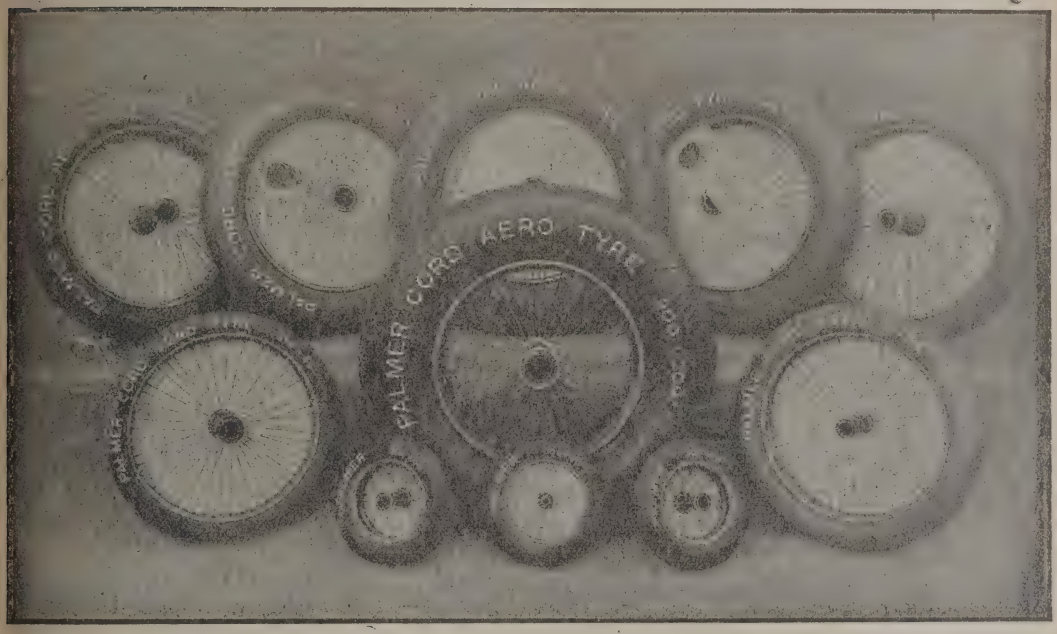
General Dimensions.



Wing span, upper plane	42 ft. 10 in.
Wing span, lower plane	31 ft.
Wing chord	6 ft.
Gap between wings	71 in.
Stagger	10 degs.
Overall length of machine	27 ft. 2½ in.
Overall height of machine	10 ft. 10 in.
Angle of incidence	2½ degs.
Dihedral angle	3 per cent.
Sweepback	5 degs.
Wing curve	U.S.A. No 6.
Tail plane, angle of incidence	0 deg.

Areas.

Upper wing	258 sq. ft.
Lower wing	159 sq. ft.
Total supporting surface (wings and ailerons)	417 sq. ft.
Ailerons (each 21 sq. ft.)	42



The Pilot's Cock-Pit of the "J-R" Tractor.

LANDING GEAR.

Number of wheels	2
Size of wheels	26 in. by 4 in.
Thread	68¾ in.

As may be seen from the firm's own figures for performance the machine cannot be used for war purposes, as the maximu speed would have to be increased by 25 per cent. and the clim by 100 per cent. before it would be safe to send over the lin three months' hence. Nevertheless, in the advanced stages training, after a pupil has left the slow preliminary types, a before putting him onto war aeroplanes, the machine should fi a distinct field of usefulness.

Front View of the Standard "J-R" Tractor.

THE ETERNAL MAGNETO.

People in the Aircraft Industry who are interested in engines, have long suffered from the belief that British-made magnetos are not of the same quality as their German ancestors. In the early part of the war this was, unfortunately, only too true. The Magneto Industry, despite its vital importance to the Motor and Aircraft Industries, had been scandalously neglected, and it was only when the stress of war demonstrated painfully to what an extent this country had relied on its enemies for its most vital necessities, that efforts were made to bring the Magneto Industry into its proper place in the scheme of things.

Now, however, the British Industry is able to hold its own with that of any country in the world, and one is glad to see that the British magneto firms are adopting practical methods of demonstrating the fact to all and sundry. One excellent method of doing so is that adopted by the M.L. Magneto Syndicate, Ltd., of Coventry.

This firm has issued for the education of all and sundry a thoroughly convincing booklet on the methods by which the M.L. magneto is produced. The booklet opens with a brief exposition of the magneto situation before the war, showing how the German Government subsidised and supported the German magneto manufacturers and recognised the extreme importance this key to industry would assume in the event of war, and relates how this firm, then known as Morris and Lister, Ltd., electrical engineers, realised the vital necessity for the manufacture of magnetos in this country.

The firm possessed excellent general experience in the winding of fine coils similar to those used in magneto work, and by skilfully concentrating their technical and manufacturing resources, they managed to produce a considerable number of magnetos, which were on trial by a number of leading motor manufacturers within three months of the outbreak of war. So satisfactory were these magnetos, that contracts were promptly placed by many motor firms, and early in 1915 a separate company was formed under the name of the M.L. Magneto Syndicate, Ltd., and the present large and commodious works were equipped for a large output.

The booklet then proceeds to describe and illustrate the vario departments of the works in a most interesting manner. T illustrations show that the bulk of the work is done by gi and boys, with the assistance of a few highly-skilled men superintend the more vital and highly technical work. Anyo interested in the magneto question should certainly obtain a co of the book, which may be obtained from the the firm by m tioning this paper.

VARNISH.

Few industries are more interested in the subject of varnis than the Aircraft Industry, therefore, a neat booklet, issued the old firm of Naylor Bros., Ltd., of Southall, is particula apposite at the moment. The booklet gives such informati about the firm as is likely to inspire confidence in all its produc In this instance the question of aeroplane varnish is left t touched.

The scope of the Naylor varnishes is indicated by the f that the first use to which attention is drawn in the booklet the "finish of the factory." As the author points out, fact owners and designers have learnt that it pays to have factor which are built to give the greatest efficiency, and as a necessi corollary the finish of the factory itself is quite as important the finish of the factory's products. That is to say, the use proper paints and varnishes on the woodwork of the facto properly reliable distemper on the walls, and proper stain unpainted wood, all help to make the work done in office a workshop the better. The necessary paints, stains, and so fo for outside work, are also supplied, and a special white paint, composed as not to change colour under the effect of chemi fumes, is turned out for use in laboratories. Also special co paints are produced for wagons of all sorts, in fact, there nothing in the way of protective covering for workshops their accessories that the firm cannot supply. Considering amount of workshop extension that is going on at present, t little booklet should be of considerable interest to manufactur of aeroplanes and builders of factories alike. Copies can obtained from the firm's London office at 407 and 409, Oxf Street, W.1.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

The Production of Aeroplanes and their Components

(Tenth Instalment.)

BY STEPNEY BLAKENEY.

Annealing.

The batch of fittings having been completed, the next thing to do is to anneal them in a gas-fired furnace, so that they may be of the correct hardness or softness. Many excellent types of these furnaces are made by some of the best firms making gas fittings and apparatus.

The annealing furnace must, of course, be fitted with a pyrometer of an approved design, and, although expensive, these instruments pay for themselves, because they prevent fittings from being unnecessarily over-heated, and prevent gas from being wasted. They also let one know that the correct temperature has been reached, and they therefore prevent fittings which are imperfectly annealed from being used, which, of course, is a safeguard to the firm's reputation. They are, of course, required by the A.I.D.

Gas furnaces require handling in an economical manner, or considerable waste of gas is possible, and they soon become an expensive item in the firm's charges. It would hardly be advisable to light up the furnace for a couple of small fittings, so one should wait, if possible, for a fair batch of them. It is not advisable either to purchase too large a furnace at first.

Further Thought.

Having outlined a generally accepted method of producing wiring plates of one kind, it is superfluous, almost, to add that this method may be adopted with certainty of quick production, to most other kinds. Of course, there are sheet metal fittings which really require the skill and thought of an expert sheet metal worker, and in many cases it is frequently necessary to experiment as to the best methods to be adopted. Two or three attempts may have to be made before a fitting is produced successfully, and in such a manner as permits of repetition work.

There are many methods of making things, but in our days, unless they are capable of being used on a commercial basis, they are useless, and further experimenting and thought are necessary.

Bolt Making.

Assuming that the wiring plates used in the construction of the fuselage have been made, and bent, and passed into the finished part stores, the next question to be considered is, are the bolts in stock? If they are, so much the better, but it is quite probable that about a couple of days before they are wanted, somebody may have discovered that only half the quantity have been delivered, and that it is uncertain where the next lot will come from. We will therefore assume that the hexagon steel bar required for making these bolts is in stock or can be obtained quickly.

Under these circumstances, it is decided to make an immediate start on production. The Capstan lathe selected for the purpose will be a ¾-in. Capstan, fitted with wire feed, and with suitable colletts, which is the technical term for the jaws in the chuck which grip the bar which is to be turned down into bolts.

The bar steel being available, a length of 6 to 7 ft. will be fed through the support attached to the lathe head on the left-hand side of the lathe and right through the lathe head until it comes through the colletts to where it comes in contact with a stop in the Capstan head.

The next thing to do is to prepare the cutting tool, for cutting down the bar to the required size of the bolt.

The Capstan lathe not being provided with tools, it will be necessary to obtain what is called a box tool holder, which has a shank turned down to fit into the Capstan head, and into the box tool holder is fitted the cutting tool and the Vee guide or support for the turned bar as it passes the cutting tool.

Capstan Setting.

The cutting tool is put into the box tool holder and held in position by means of a set-screw screwed down onto the top of the small piece of high speed steel forming the tool. This tool is formed in various ways, according to the ideas and experience of the Capstan setter-up. Some prefer to fix the tool up to cut level with the axis of the steel bar, and others prefer to have the tool inclined upwards at an angle. This detail, however, will be settled by the foreman of the machine shop.

The next tool to be fitted into the Capstan head tool holder will be the circular button die and holder, with special disengaging head, so that the operation of screwing can be stopped practically instantaneously at the end of the desired length of screwed thread. The reversing of the Capstan for unscrewing the die can be done by hand or with a slow reverse belt drive, whichever is more convenient.

The next tool to be fitted will be the cutting-off tool, or parting tool, in the cross slide, for the purpose of parting off the newly turned bolt from the bar.

All the stops for the semi-automatic working of the Capstan having been adjusted and locked with the lock-nuts, the next thing to do will be to attempt to make the first bolt. Of course, the first few may be expected to be failures, as various adjustments will have to be made until the correct diameter of the turning is arrived at, and also till the screwing, parting off, etc., have been tested.

Capstan Turning.

It will possibly be as well to detail the operations, which can be carried out far more quickly than it takes to write it.

The first thing to do will be to start the lathe, turn on the "cutting compound" so that it thoroughly lubricates the front turning tool, catch hold of the long lever which operates the slide carrying the Capstan head tool holder, and press the turning tool up against the hexagon bar steel, thus reducing it to the required size and length, which are determined by the stop.

Having completed the turning down of the hexagon steel bar to the required diameter and length, which, by the way, is all done in one cut, comprising the roughing and the finishing cut, the next operation is to reverse the movement of the lever, and move the Capstan head back.

This movement brings into position the button die, or what is frequently used, when obtainable, a geometric die head, containing the dies. Pull the lever forward, and gently but quite firmly press the die up against the end of the bolt. The die will then commence to cut the thread. Continue pressing until the lever will travel no further. The die will continue to cut probably a couple more threads, and then the die head will automatically become disengaged from the hollow die head holder, and will continue to travel round with the bolt.

Reverse the belt drive, if fitted, as it should be, and the die will work itself off the bolt.

Having completed the cutting of the thread on the bolt, it now remains to part off the bolt from the bar. For this purpose we now turn to the cross slide and take hold of the feed handle and bring the tool up against the hexagon bar, which promptly cuts off the bolt, which falls into the tray underneath.

Chamfering.

Assuming that a number of these bolts have been made, they will have to be taken to another Capstan lathe, if available, and there have the heads faced off and chamfered. This is done in one operation, by the tool fitted into the cross slide tool holder. The operation consists of picking up the bolt and slipping it thread first, into the jaws of a collett and then pressing the tool in the cross slide across the face of the hexagon head of the bolt, and cleaning off the head and chamfering. This operation having been completed, the bolt is taken out, and the operation of bolt making is finished.

Nut Making.

The bolt will now require a nut, and the same sized hexagon bar will, of course, be suitable for making the nuts. The setting up of the Capstan for nut making consists of fitting a stop for adjusting the feed of the bar, thus allowing only the correct length of bar to be fed through. Having done this, a tool for facing and chamfering the nut should be fitted into the tool holder of the cross slide on one side, and a parting-off tool in the tool holder on the opposite side.

Also a centre bit can be fixed in the Capstan head tool holder for giving the twist drill, which is also in the Capstan head, a true start. This twist drill is, of course, a tapping size.

The procedure of work consists first of facing and chamfering the head of the nut. This being done, centre the nut into the centre bit ready for drilling. Then reverse the lever and bring the twist drill into operation and drill the hole through nut. When this is done, part off the nut, which can be tapped in a small jig in a tapping machine, which is quicker than tapping in the Capstan lathe.

The time taken to produce, say, ¼ in. bolt and nut, about 2 in. to 3 in. long, may roughly be assumed to be about four minutes. From this it will hardly be necessary to point out how very valuable a few Capstan lathes, or even one only, can be in a workshop, in case of delay in delivery of bolts from the recognised manufacturers.

(To be continued.)

A REORGANISATION.

Reorganisations have recently taken place in the London Aviation Co., Ltd., of 27 and 28, Charlotte Street, E.C.2. Mr. A. Montefiore has joined the Board of the Company as Chairman, Mr. A. H. Botwright retaining his position on the Board as heretofore. Under the new arrangement the outlook for the firm is distinctly promising, and it should contribute valuably to the output of aircraft.

AERO-MOTORS
IN KIND AND CONSTRUCTION

By Geoffrey de Holden-Stone

TRYERS AND SPINNERS.

Fortune the inconstant was ever fond of a good gambler; by whom I mean no trifler with tempting odds, but the man who, having picked his fancy, refuses to be put off, but backs it through thick and thin until it wins. That is the only man I have much use for, though the antis have none. But then none of us in England have any more use for the antis, so we shall break even at last.

Yet very early in that long ago, when I knew silk and snaffle better than sparking plugs, and only dealt with motors fourteen hands tall—though oft-persuaded to measure thirteen-two—I learnt that placing is the supreme art of racing. When you have something that can break seventy-five seconds against the watch with its shoes on, slip it in a selling plate. Then you can assuredly take any odds while you can find a layer. Whereas in the handicap over a distance you may just come undone by a short head. Especially when the stewards have backed the other.

How often, too, do you discover the real stayer in the supposed-to-be sprinter that was just not speedy enough?

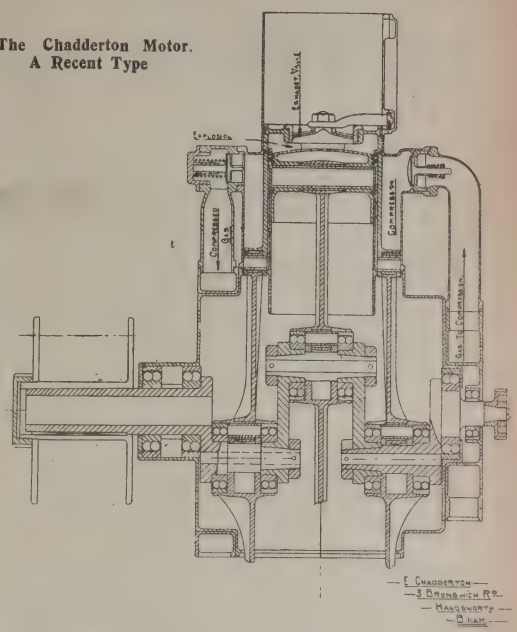
In most of which respects I have found a motor to be very like a Mary Morrison. Just as much a thoroughbred, it is not all at once, or for many a careful trial, that you find out all about it, or the class it best belongs to on the running. But it is only the good gritful gambler of his time and talent who ever gets to know. Such a one as half-a-dozen men you know, for whom neither Whitehall nor Farnborough had any use, before the war.

Such a man, I fully believe, is Mr. E. C. Chadderton. Therefore, since we are getting very sick of the official stumers, it is the more interesting to see how his second effort with his motor in the radial class is likely to run; especially since his original cycle-purpose is unchanged. How original—in the better sense—it was and is, and how much closer is its breeding to military needs than the half-breds and cocktails of convention and imitation, I have already said. Merely as my own opinion.

Let us then examine the illustrated evidence, as there is no form to go upon so far.

DETAIL CHANGES.

That channel-shaped collar-valve was, after all, a queer kind of bit, though I, for one, had little doubt of its reliability. But to make sure, Mr. Chadderton has substituted another, of the conical disc pattern, mounted in a seating screwed into the head of the outer piston and having its short thick stem attached to a lever with a roller on the free end working in a cam slot and hardened steel pocket on one side of the cylinder-top.



This device is new enough—to my experience at least—and simple enough. It is clearly capable of free working attachment, as the compression will seat it tightly. The lever has extremely little work to do, so however exposed it may be to the hot gases, it should not distort. Trial only can show. There may be, I venture to suggest, another and more effective way of doing the same thing. But in any case, there is so little actual mechanism—none whatever needing extraneous operation—that in its most essential function the motor is all but as good as valveless. So much may be reasonably conceded.

Then it will be readily apparent that the crankshaft has been very soundly and very commercially designed—out of bits and pieces of readily tested steel, with the grain all going the right way—and coming to an easy and true assembly. There are no cotter bolts. So it is evident that the connecting rod big ends are in the form of alternate hooks and hooked prongs—hook within prong—as to their attachment round the crank-pin; their upper shoulder-like segments serving to house the ball-races. So that in assembly the slipping on the crank-webs over the male cones of the pin and under the ball-races, serves for the final lock-up when the nuts are set home. These nuts are also pinned through; but it may be suggested that they should be deeply grooved round their circumference, so as to hold the essential S-like wiring in stout brass that is more reliable than any split-pin. Altogether a very pretty assembly-device; not only simpler, but incidentally stronger than any of the Continental ingenuities.

SOME ADVANTAGES: AND A NOVELTY.

It need hardly be pointed out that in a radial proposition like this the crankshaft is absolutely floated by the opposed motion of the pistons, inner and outer: and the ideal of the—S—scheme of design thus realised, including the elimination of all tendency to knock as well as wear upon the journal bearings, which are actually quadrupled fore and aft.

The Chadderton Motor.
A Recent Type

The Scheme of Induction is shown in the section above.

Now we come to the real novelty of the design. Mr. Chadderton, realising that his original model was more than a little "on the leg" as a rotary or a radial, has also sought, like a wise trainer, to make it crouch to its thirteen-two or less: that is within a total diameter of 36 inches between cylinder tops. Withal, while keeping an effective stride of an eight-inch expansion for the four-inch stroke of each piston. And here—more strongly than ever—do we note the apparent paradox of the piston-within-piston scheme of design; in that it is all done on a crank-throw of merely two inches between journal and crank-pin centres. Some power-stride, and explosion efficiency pulling to the very end, considering that the bore is 4½ inches in this particular model.

And there is no pin-and-cork business about this result either. The Chadderton permanent lead-pad takes the form of an intermediate stationary sleeve between the pistons, which is supported by a flange at its base that fits into a recess in the periphery of the crank-chamber. In the illustration, it seems to float loosely, or be attached in some way to the heads of the outer connecting rods. Actually, the flange is slotted out at the sides to clear the latter at full instroke of the outer piston; the position shown.

THE WORKING RESULT OF IT.

Now it will be seen that the immediate effect of this sleeve-interposition is to shorten the length of the outer piston, which, not being now required to contain, and serve as a slide for, the inner one, need have no greater length than its own actual stroke, having plenty of sliding space of its own within the outer cylinder or shell. At the same time, the sleeve acts as a slide and container for the inner piston.

Thus the whole motor can be, and is, shortened by the exact length of the stroke of either piston; i.e., four inches. That being so, how much is saved of the original amount of friction? It was—or would have been—the full eight inches of the outer piston's surface, four for its stroke and four for its content of the inner one. And then four more for the surface-and-stroke-length of the latter. Now, with this intermediate sleeve, we have the stroke-surface-length of the outer piston, four inches. As many more, for the outer surface of the sleeve. And then, naturally as much again for the inner surface of the

sleeve and the stroke-length surface of the inner piston. Total, sixteen linear inches of surface in friction, as against twelve. So that instead of friction being reduced, as claimed, it is clearly actually increased by a third! Lubricant consumption will hardly be reduced by the change: but the saving in motor height is well worth it.

The Question of Balance.

The next point to note is that of mechanical balance. The length of the outer piston—and hence its weight, is reduced by one-third: which leaves it still twice the length of the inner piston. On the other hand, each of its two rods must be four inches longer, giving at least two-thirds of a rod's weight above the weight of the central rod moving always in opposition to them. Whereas previously, the weight of the pair should have just balanced that of the middle one, which is now proportionately shortened.

What to do then? Except by strengthening the combustion head of the outer piston—which means more metal, however fine and strong it may be—you cannot cut much weight out of its shell or trunk. Thanks to that intermediate sleeve, nevertheless, it can now be skeletonised over the lever four inches of that trunk to a lattice or lace-work: which alone will reduce friction as well as weight. But even so, it will hardly be got down below the weight of the inner piston, for the margin of reduction on the one side is slotting *plus* thinning against actual thickening of the inner piston's metal: and then there is the weight of that extra two-thirds of a rod.

All this, therefore, to show that complete mechanical balance in the unit of this or any piston-within-piston design, is all but unattainable. Some percentage of wear—however reduced—must occur on the bearings despite the absolute balance of explosion shocks. The perfect balance, therefore, can only be looked for, from the opposition—direct or *en V*—of a similar unit.

The New Cycle: How it Works.

Follow now the examination of the charging cycle: in my opinion clearer, and far more assured of fulfilling the excellent and wholly original Chadderton ideal of mixture injection at the last moment. If now we look at the rear end of the crank-chamber mass, we shall notice an annular induction ring—similar to that of the Anzani, with a throttling sleeve at the bottom right-hand corner, to control the amount of air admitted. For this ring is nothing more than a collector for each of the air induction pipes above, through which—notice the arrow—the air is sucked in through the a.o. valve—right-hand top corner—by the differential part of the outer piston.

Here it should be said that this compression volume is purposely made much greater than is actually required to fill each cylinder—by about 20 per cent. at a rough estimate—at low altitudes, with the idea of getting just that excess margin for the whole set that at high altitudes the rarefaction of the atmosphere will not affect the full charging, and hence the efficiency of the motor.

Which is quite excellent, so far as it goes. But it is not more the actual rarefaction, than the chemical composition of the air at high altitudes which makes the trouble. Still, the distinct advance of the Chadderton inception is manifest.

Then, compressed, the air is driven through the other a.o. non-return valve—top left-hand corner—and thence downward into a similar annular collector on the front side. From this it passes through a pipe to an air container—"bottle"—from which the excess volume of air can be fed by separate pipes to two or three of the cylinders for automatic starting.

It will also be seen that this gives air-cooling under the shortest of forced draught.

The automatic starting, however, is merely a useful side-show of the cycle. The main further issue is that the air now passes, at a pressure of some 75 lbs., through a carburetting device: from which it then continues—as an appropriately proportional mixture to each combustion chamber in turn—marked A—as soon as the exhaust valve has closed, at the moment previous to firing.

And that is all there is to it, descriptively. The inventor suggests that the cycle goes "a long way round" to its result. Frankly, I disagree. He has set himself an ideal—and to my mind a most valuable one—and I do not see off-hand how he could have realised it more simply. Nor do I see that it is any more "lengthy"—it is certainly not more complicated—than the average conventional way of direct carburation; or than even the classic fuel injection method of which the Antoinette is the example best known to aviation.

There may be an easier mechanical way of doing the same thing: just as there may be a better fruit than a strawberry. But despite Luther Burbank, the strawberry is there. So is the Chadderton design. In my opinion it seems to have arrived clearly enough. The only "ifs" are the reliability of those a.o. inlet valves—pressure-balanced after all—and the special carburettor. If Mr. Chadderton has got—or can get—the latter right—and it will have to be something very special and different, entailing a lot of calculation as to how small to get its choke tube and trunk—I do not see why this motor should not go a long way in aviation.

(To be continued.)

Market Affairs.

August 16th, 1917.

GOVERNMENT CONTROL.—A report has just been presented by the Merchants' Committee of the London Chamber of Commerce to the Premier, and other Government Departments. Many of their statements corroborate the remarks contained in the Market Report which appeared in The Aeroplane of August 1st. The report is too long to be given in detail, but for the benefit of readers several important extracts are given below.

(1) The policy at present pursued appears to be based upon an imperfect appreciation of the principles upon which the import business of the country has been conducted, and of the means by which the natural resources of the country itself have been rendered serviceable for the needs of industry, whether carried on by the State or by private enterprise, separately, or in alliance with the State. It is only in comparatively recent times—outside the Ministry of Munitions—that the direct employment of trained business men has been availed of to any extent by the Government. The action of Controllers has in many cases conduced to high prices and ultimate scarcity.

The following recommendations are made:—

(a) That the Government should cease to act as trading intermediary between producers and consumers, but should utilise to the fullest extent the services of the business community.

(b) That to this end merchants should be encouraged to continue to carry or import stocks of commodities essential to this country.

(c) That so far as any control of imports and exports is concerned, the quantities allowed should as far as possible be based upon a fair allocation of quantities amongst merchants dealing in particular articles, after consultation with representative trade organisations. Permits should only be granted to British and Allied subjects who are legitimate merchants and importers in the trade involved.

(d) That the various Control Departments should be co-ordinated so far as to secure a uniform system on questions of principle and to obviate present delays in dealings with licenses and permits.

(e) That Control Departments should in all cases be assisted by representative business men nominated by their respective trades.

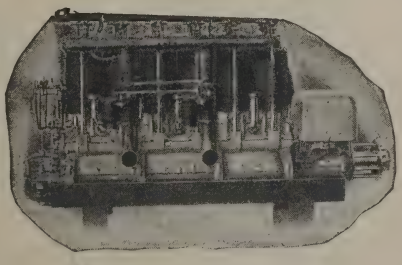
(f) That steps be taken to represent to the Government, to Members of Parliament, and the public generally, the views set out in the Report of this Committee.

A special appendix is added to the Report showing the unsatisfactory results of the Government interference in the Timber trade.

The Timber trade is one which has had exceptional experiences of the unsatisfactory results of Government intervention in a business where technical knowledge is a first consideration. At an early stage of the war the services of the Timber Trade Federation of the United Kingdom were offered to the Government, but were not accepted, when the War Office turned over to the Office of Works the great undertaking of providing buildings, hutments, etc., for the new Army. A Government buyer was appointed, with the result that f.o.b. prices appreciated, and incidentally the German Government declared wood contraband. The Timber trade consider that had they been consulted by the Office of Works at an early stage, they would have enabled the Government to purchase their large requirements on a more economical basis.

The appointment of a Controller of Imports generally was undoubtedly necessary in view of the tonnage question, but this official omitted to ask the advice of the trade, and considerable surprise was expressed when one of the most important items required by the War Office for buildings, etc., was prohibited, viz., planed or dressed boards, floorings, and matchwoods.

The prohibition, however, was eventually withdrawn, after having created serious difficulties, necessitating in some instances the discharge of such goods already loaded in steamers, apart from the undue appreciation of prices which occurred through the temporary stoppage of supplies.



The next step taken by the Government was the appointment of a Controller for Timber Supplies. The gentleman placed in the position was a distinguished Indian Official, who invited the Federation to nominate a few of its members to serve on an Advisory Committee, reserving to himself the

C.D.C.

right to appoint two or three others at his discretion. This was a move in the right direction, and the Timber trade regret that the Office of Works did not do likewise in the initial stages of the war. It must, however, be added that the Advisory Committee have expressed themselves as being dissatisfied with their *locus standi*; official orders are issued without reference to them, and become accomplished facts before they had the opportunity of discussing them. They also complain that minor officials have been appointed by the Controller without asking the advice of the Committee, including men of military age, when there were a large number over age, with greater experience, who would have filled the positions quite efficiently.

The action taken by the Controller in prohibiting the import of Timber in the early months of the year, together with the restriction on spot prices, has had the unfortunate effect of preventing importers from contracting for supplies from Norway and South Sweden, when it was of the utmost importance that Timber should be attracted here to fill up seriously depleted stocks. When, however, the Department appreciated the position, instead of giving importers a free hand, though confining them to a maximum percentage of profit, they publicly announced that merchants were permitted to import and sell at a price not exceeding 33⅓ per cent. on prices ruling on January 31st, 1917; the result of which was to stiffen the backs of shippers who were at that moment disposed to ease their f.o.b. prices. In view of the submarine menace, and Germany have virtually withdrawn the arrangement with Sweden, insurances and freights became abnormal, so that this permission became more or less a dead letter, and merchants' holdings were reduced to a level hitherto unknown in the history of the trade.

Recently, powers were given to the Controller to commandeer approximately all the Timber stocks in the country, with the result that the merchants' business has, for all practical purposes, become moribund. An army of officials has been created to carry out the distribution of these stocks, which might well have been done by merchants on behalf of the department, with the staff and machinery at their disposal.

The results of the inquiries made by the London Chamber of Commerce confirm the statements which have been made in this paper from time to time, and, although the appendix on Timber refers to softwoods, we see that official interference invariably ends in "Excessive Prices, Shortage of Supplies, Avoidable Muddle," and, more serious still, "Impeded Output."

In view of the herculean effort to be made in order to increase the output of war materials, one thinks it is time the Government removed some of the restrictions which are seriously impeding output.

MARKET REPORTS.

Prices are for quantities on usual terms.

COPPER.—The whole position appears to be in a state of chaos. The United States Commission do not appear to be profiting by the serious mistakes made by our officials, and it is quite apparent that U.S.A. Copper producers are anything but satisfied with the prices fixed. The labour problem in the States is still very serious, and no satisfactory solution appears to have been evolved. Fortunately, there are ample supplies. The prices here are unchanged, although it is felt that the labour trouble in U.S.A. will result in authorities here being compelled to make a still further reduction in prices.

Current Prices.

Standard Copper	£125 per ton, cash.
Copper Sheets	160 per ton.
Copper Tubes, S.D.	19¾d. per lb.
Brass Sheet, 24 Gauge	15⅞d. per lb.
Brass Tubes, S.D.	16½d. per lb.

TIN.—Since the last report there has been a very sharp decline in prices. This may only be temporary. At the same time, it proves that the erratic condition on the market has not yet come to an end. Upon reference to the comparison of prices it will be observed that the decline has brought the market to the level it had reached just over a year ago.

U.S.A. consumption is increasing, and consumers there are making pretty large purchases from the East.

Comparative Prices.

To-day, August 15th	£244 0 0
August 13th	242 10 0
August 9th	247 0 0
Last Week	245 10 0
July, 1917	242 15 0

STEEL.—As stated previously, many of the works were closed all Bank Holiday week, but are now in full swing again, and it is generally expected that by the end of 1917 there will be a very appreciable increase in the output of all classes of Steel, particularly Aircraft Steels.

The control of Steel is very strict indeed, and it is now impossible to obtain supplies for anything but direct Government work. Prices are still unchanged, and there does not appear to be any indication that they will be altered at present.

Current Average Prices.

R.A.F. 3B	Steel, 36s. to 40s. per cwt., Basis. (Black or Blue Reeled).
R.A.F. 1E	Steel, 78s. to 80s. per cwt., Basis. (Black or Blue Reeled).
R.A.F. 9A	Sheet Steel, 30s. to 32s. per cwt.

ALUMINIUM.—The position is still unchanged, and supplies are still very good.

Official Prices.

Ingot	£225 per ton.
Remelted	210 per ton.

LEAD.—The chief concern at present is the question of supplies, and this is being influenced chiefly by the labour difficulties. The situation being far from satisfactory, in fact, there are indications that the trouble will spread.

Prices still remain unchanged.

Official Price..... £30 10s. to £29 10s.

TIMBER—The Timber market is in a very bad way indeed, and question of supplies is most serious. It is now generally agreed that only 20 per cent. of the Timber imported by the Admiralty is suitable for aircraft works. Walnut is very scarce indeed, and there are only a few shipments of Mahogany being received. Shipments of Silver Spruce are as scarce as sovereigns. During week ending August 8th, one shipment only appears to have been received.

One is anxious to see what steps the Air Board intend taking in order to procure very large supplies of Timber to enable factories to substantially increase their outputs.

Prices are very unsettled, but the tendency is upward.

Current Average Prices.

Silver Spruce, 17s. to 18s., c.f.
English Ash, 13s. 6d. to 15s., c.f.
Walnut, 2s. 3d. to 2s. 6d., s.f.
Mahogany, 2s. to 2s. 4d., s.f.

Prices include selection and delivery.

FABRIC.—One is informed that the official price for Fabric is 2s. 8d., 36 in. wide.

One can only say that the price is, to put it mildly, atrocious, and confirms the statement of the London Chamber of Commerce, viz.: "The action of Controllers has in many cases conduced to high price."

The average price of 17C Cloth, before the material came under Air Board Control, was 1s. 11d. to 2s., 36 in. wide. One is quite aware the price of Flax was on the increase. At the same time, one has excellent authority for stating that if a competitive market were still in existence, the highest possible price would be 2s. 3d. per yard, 36 in. wide.

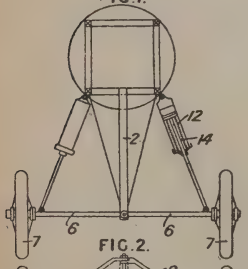
108,423. August 26th, 1916. Quaglia, G., and Capello, A. Conection of lengths of wires with hooks, tightening devices, and other members.

Abridgments of recently published Specifications.

FIG. 1.



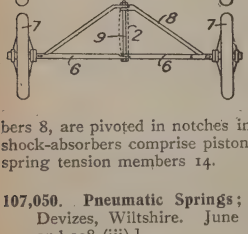


FIG. 2.

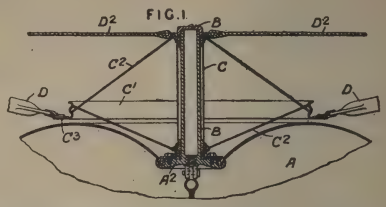
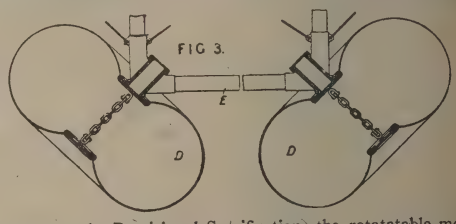


107,009. Aeronautics. Vedrines, J., 33, Rue Notre Dame de Lorette, Paris, and Astoux, L. L., 35, Avenue des Moulineaux, Issy (Seine), France. May 29th, 1917, No. 7698. Convention date, May 29th, 1916. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act. (Class 4.)

Land Wheels; Shock of Landing, deadening. — The wheels 7 of an aeroplane are carried by a single or divided axle 6 pivoted at the centre to a vertical web 2 braced to the fuselage, the outer ends of the axle being connected to the fuselage through shock-absorbers 12. The axle 6, shown divided in Fig. 2, and rearward bracing-members 8, are pivoted in notches in the web 2 by a long bolt 9. The shock-absorbers comprise pistons and cylinders with rubber or coil-spring tension members 14.

107,050. Pneumatic Springs; Aircraft. Sloper, T., Southgate, Devizes, Wiltshire. June 12th, 1916, No. 8306. [Classes 4 and 108 (iii).]



Relates to means for mounting air-cushions for aircraft of the kind described in Specification 105,977. According to the invention, the air-cushion is rotatably mounted on a support, the axis of rotation being perpendicular to the side of the cushion whereby it is secured to the support. As shown in Fig. 1, the plate A^2 of the cushion A is provided with a hollow spindle B rotatably mounted in the hub C of a wire wheel provided with spokes C^2 and a rim C^1. The rim C^1 is preferably L-shaped to provide a flange C^3 to which radial struts D and tangential ties, secured at the other ends to the aircraft, are attached. Ties D^2 may be

FIG. 1.

provided to prevent the hub C from tilting. The cushion A may be provided with an external annular plate to prevent abrasion by the flange C^3. The axis of rotation may be arranged at an angle to the aircraft, and more than one cushioning-device D may be provided on one frame E, as shown in Fig. 3. In a modification, the wheel is arranged to rotate with the air-cushion, the rim serving as a support for the cushion when under load.

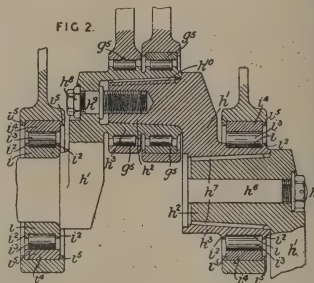
FIG 3.

According to the Provisional Specification, the rotatatable mounting may be dispensed with, the wheel and the cushion being fixed with regard to the aircraft, the cushion may be secured to the periphery of the wheel, and the struts D may be hinged onto the wheel.

107,052. Crank-shafts; Bearings. Orville, T. L. R. D', formerly 241, Addison Way, Golders Green, London, now Cross Deep Lodge, Twickenham, Middlesex. June 13th, 1916. No. 8343. [Classes 12 (i), 12 (ii), 80 (ii), and 122 (i).]

In an aeronautical or other internal-combustion engine, the small and big ends of conecting-rods and the crank-shaft bearings are provided with anti-friction rollers, and a built-up crank-shaft is employed. The latter, as shown in Fig. 2, consists of Z sections fitting into one another, each section consisting of a web h^1, which may be milled to **H** section, and a conical pin h^2, and an internally conical sleeve h^3. The engaging parts which form the crank-pins are drawn together by screws and nuts h^9, h^{10} and are locked by keys h^{10}, while the portions forming the crank-shaft journals are formed with engaging ribs and recesses h^7, and are drawn together by bolts and nuts h^6, h^5. The inner races i for the rollers i^3 of the crank-shaft bearings may be formed in the crank-shaft, or may be separate and formed with retaining flanges i^2. The outer races i^4 are secured in the crank-casing by retaining flanges i^5. One pair of bearings may be fitted with tapered rollers. The bearings for the big ends of the connecting-rods are similarly formed, the inner races being formed in the crank-pin, and the outer races g^5 either formed in the connecting-rod ends or

FIG 2.



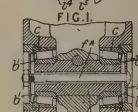


FIG. 1.

detached. The gudgeon *a*, Fig. 1, is formed with reduced ends which are supported in roller bearings inclined either outwards as shown, or towards the centre. The rollers also are formed tapered and are grooved at one end to receive retaining flanges b^1 on the inner races, which may be formed in the gudgeon or separate as shown. The inner races may be adjustable by nuts screwing into the gudgeon, or, as shown, the outer races *c* may be adjustable by cups *f* screwed into the piston or drawn together

by a bolt *f** passing through the hollow gudgeon. The spaces enclosed by the cups *f* may be supplied with oil for lubricating and cooling.

107,051. Brakes. Sloper, T., Southgate, Devizes, Wiltshire. June 12th, 1916, No. 8307. [Classes 80 (iii) and 103 (i).]

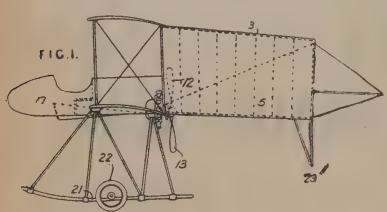
Relates to Bowden-wire brake-mechanism in which the wire is laid in a curved path, and is so arranged that the wire and casing of the wire each operate separate brakes. The brakes are mounted on the circumference of a fixed wheel-like support. In the form shown, four brakes C^1, G are mounted on opposite sides of a wire-spoked, fixed wheel B of the type described in Specification 15086/15. The pull of the wire J operates the brakes C^1 through a sliding yoke D, links C^3 and levers C, and the thrust of the casting H operates the brakes G through a slide H^1, links, and levers. The brakes operate on the inside of a drum X which may be carried by the wheel of an aeroplane. In this example, the end of the casing H at the operator's end is fixed, and the movement of the slide H^1 is due to the tendency of the casing to assume a straight line when the wire J is pulled. The pull-wire may be held stationary at the operator's end and the casing moved, or both wire and casing may be moved in opposite directions.

FIG. 1

107,099. Aeronautics. Wilson, T. E. C., Glenwyllin, Waterloo Park, Liverpool. July 17th, 1916, No. 9995. [Classes 4 and 9 (ii).]

Aerial Machines without Aerostats; Planes, construction and arrangement of; Propelling; Steering and Balancing.—A biplane is provided with rearwardly-extending surfaces 3 covering the top of the fuselage, the sides 4, 5 of which also are covered thereby forming an inverted conduit through which the air passes. The bottom of the fuselage may be covered. A propeller 12 is provided at the front end of the conduit, and one or more elevators 7 at the rear end. Side propellers 13 are provided; these may be driven by the same engine as the propeller 12 or by a separate engine. Clutches and variable-speed gear are provided for regulating the speeds of the propellers 13, or stopping one of them, for steering. Helicopters may be fitted.

FIG. 1.



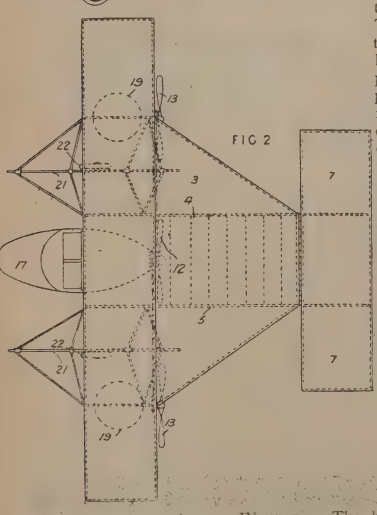


FIG 2

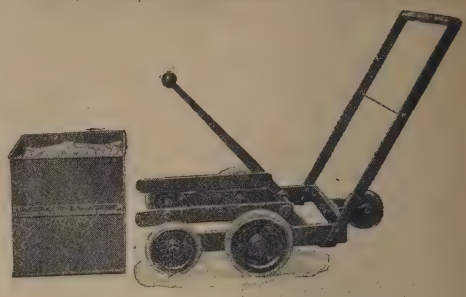
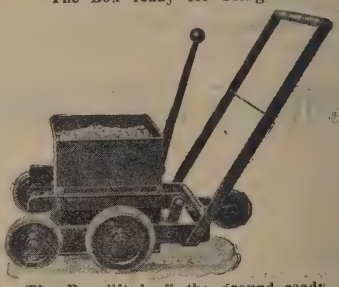


Cars and Cabins; Aerial Warfare.—The body 17 carrying the pilot's seat is mounted on the lower plane, and two gun mountings 19 may be arranged between the upper and lower planes for operation by two observers.

Land Wheels, Runners, and Skids; Floats, arrangement of.—Skids 21 with wheels 22, and tail-skids 23, may be provided as shown. The skids 21 may be provided with floats of cork, etc.

A USEFUL ACCESSORY.

Works superintendents and others will be interested in the "U"-Frame Jacktruck, which is designed for rapid transveying work in machine shops and warehouses or wherever articles are collected in boxes. It is exceedingly simple both in design and in use.



The Box and Jacktruck ready for use.

The Jacktruck—which in place of the ordinary platform has a frame with "U"-shaped jaws — is wheeled up to the box; the jaws pass under two battens on the sides of the box and then the operation of a hand lever lifts the latter off the ground; the Jacktruck with the box is now easily wheeled to any weighing machine, gauging room, packing room or other spot where required.

The Box ready for being lifted.

The Box lifted off the ground ready for transportation.

The Jacktruck will turn round either way in its own length and can easily be pushed in and out of awkward places. It is of metal and the wheels are fitted with roller bearings. All parts are standardised, and it can be built in any size to suit boxes up to two feet wide.

It is claimed by the makers—Messrs. J. T. Hardaker, Ltd., of Bowling Iron-works, Bradford—that one "U"-Frame Jacktruck with 30 boxes is as efficient as 30 ordinary transveying trucks—of course, at far less cost.

AIRCRAFT SPORTS.

The first annual sports of the Handley Page Athletic and Social Club are to be held at Avenue Grounds, Cricklewood Lane, on Saturday, August 25th, at 2.30 p.m. Among the items on the programme are a few open events, confined to aircraft workers in Hendon and Cricklewood districts, other than members of the H.P. Club. The firm has always encouraged sports of all kinds, and is again giving practical encouragement by generously providing all the prizes free of cost. Mr. F. Handley Page has kindly consented to present the prizes. For entry forms and further information apply to W. H. Jones, hon. gen. secretary, 12, Olive Road, Cricklewood, or tickets may be obtained from any employee of Handley Page, Ltd.

AIRCRAFT FITTINGS.

In a recent issue of The Aeroplane it was stated that the Albany Forge, Ltd., is in association with Whiteside and Caslake. It is, however, pointed out that the Aviation Department of the Albany Forge, Ltd., is entirely under the control of Mr. W. Lovelace-Osborne and is not in connection with the firm afore-mentioned. The Aircraft Department, which is situated at 45, Goldhawk Road, Shepherds Bush, W.12, is concerned entirely with aeronautical engineering and is prepared to take on contracts for any parts of aircraft.

PERSONAL NOTICES.

DEATHS.

BAILEY.—Writing to the father of Sec. Lt. Clive Maxwell Bailey, R.F.C., whose death was announced last week, his C.O. says:—"Your son will be remembered in this squadron as one of the keenest and most enterprising of our pilots. He was always ready and anxious to fly, and when flying to improve himself by all means in his power, always learning new accomplishments or perfecting old ones. I have seldom known a pupil who kept so constantly before his eyes the day when he should meet the enemy in the air or so determined not to be found wanting. By his tragic accident the Flying Corps lose a pilot of a sort we can ill afford, gallant, skilful, and already tried in action, and his numerous friends lose a popular and valued companion."

BENNETTO.—Hubert Victor Bennetto, R.F.C., who was killed in action on August 8th, was the only son of A. E. Bennetto, and husband of "Dot" Bennetto, of Lewisham. He was 27 years of age.

BROOKS.—Sec. Lt. Francis Cyril Brooks, R.F.A., attached R.F.C., who was killed on August 17th, in a flying accident in England, was the elder son of Capt. and Mrs. J. C. Brooks, Sarsdenfield, Canterbury. He was 19 years of age.

CREMETTI.—Sec. Lt. Max Cremetti, D.C.M., R.F.C. (killed on August 14th) was son of Mr. and Mrs. Eugene Cremetti, of Avenue Road, Regent's Park. He was 24 years of age, and had his Army commission in January, 1915; he received his "wings" in September last year.

An inquest was held at Hendon on August 18th. Capt. Maclean, R.F.C., stated that half an hour before the accident, Lt. Perrin flew the machine and reported that the engine was out of order, as it would not give the necessary number of revolutions. The machine was then marked for the attention of the mechanics. Mr. Cremetti, however, said that he did not believe it was out of order, and went up in it. The machine went fairly well at the start, but when about 600 ft. up it dropped about 100 ft. It recovered somewhat, but afterwards it sideslipped, and, falling to the earth, took fire. The pilot was killed immediately, his body being burned almost beyond recognition. The observer, Cpl. Bingham, was badly injured.

Major James Dickson said that if he had been present he would not have objected to Mr. Cremetti going up in the machine, as he was such an experienced pilot. Machines often ran well on the ground but did not go so well in the air. Unfortunately, in this case Mr. Cremetti had been wrong in his judgment.

Medical evidence showed that death was due to shock and fracture of the skull, and a verdict was returned according.

The "Weekly Dispatch" states that Mr. Cremetti was the aviator who, on the occasion of the big aeroplane raid on London on July 7th, twice charged through the raiding squadron and broke up their formation. Following up his success, he chased two of the raiders towards the Channel, and succeeded in bringing one down over the mouth of the Thames. The affair was seen by several of his brother-aviators, and on his return to headquarters he was warmly congratulated by his commanding officer.

THE MISFORTUNES OF WAR.—Another group of R.F.C. officers at Karlsruhe.

Educated at Harrow, Mr. Cremetti entered the Clement-Talbot motor works on leaving school, and remained there until the outbreak of war. When the call for dispatch riders came, he immediately enlisted, and went to France with the original Expeditionary Force. He did very good work during the retreat from Mons and at the Battle of the Marne, where he received the Distinguished Conduct Medal for "conspicuous gallantry and devotion to duty." He was also mentioned in dispatches for distinguished work at Wytschaete, and came home a few weeks later for a commission in the Royal Scots Fusiliers. Wounds received at Wytschaete prevented him being of use to the infantry, and after servng some time he transferred to the Royal Flying Corps.

He had seen considerable service in the air in France before returning to testing work in England.

DENNETT.—Sec. Lt. T. F. P. T. Dennett, Queen's (Royal West Surrey Regt.), attached R.F.C., who died on August 4th of wounds received on the same day, was the only son of Mr. and Mrs. Frank Dennett, of Croydon, and Pett, Hastings, and was aged 22. He was educated at the Whitgift Grammar School, Croydon, and was a medical student at Guy's Hospital. On the outbreak of the war he enlisted as a trooper in the Yeomanry, and went out with the 29th Division to Egypt and the Dardanelles, proceeding to France in March, 1916, where he served until the following August. After training at Cambridge he was gazetted to a commission on December 19th, and was on active service from January to April with his regiment. He was then attached to the R.F.C. after a short training at Brooklands, and met his death while engaged on a reconnaissance as an observer over the enemy lines.

His C.O. writes:—"I cannot tell you how sorry we all are. Your son was extremely popular in the squadron, and was always ready to do his work and take any risks that were necessary. During the time your son was in my squadron I had grown to look upon him as a thoroughly reliable fellow and good officer and a very promising observer."

DOYLE.—While flying near Grays, Essex, on August 17th, Lt. Doyle, R.F.C., came into collision with another aeroplane piloted by Lt. Timmes. Both machines fell from about 250 ft. into the Thames. Mr. Timmes was picked up between the training ship "Cornwall" and the Essex shore, but Mr. Doyle was drowned.

GOODMAN.—Sec. Lt. John E. Goodman, R.F.C., who was killed in aerial action on August 14th, was the eldest son of Mr. and Mrs. Fred Goodman, of Barnes. He was 19 years of age.

HARGREAVES.—Sec. Lt. Cyril Augustus Hargreaves, R.F.C., who died on August 15th from wounds received in action the same day, was the younger son of the late Augustus Hargreaves and Mrs. Hargreaves, of 41, Warham Road, Harringay. He was 20 years of age.

HAY.—Lt. Donald Yalden Hay, Royal West Kent Regt., attd. R.F.C., who was killed whilst flying on August 11th, was the youngest son of John Yalden Hay, of Warley, Bromley, Kent. He was 24 years of age. His promotion to lieutenant was gazetted in June, 1916, and he had his "wings" in February of this year.

JORDAN and HANDLEY.—A biplane from Brooklands aerodrome caught fire in the air and fell in Surrey about noon on August 20th. Lt. H. S. Jordan, R.F.A., attd. R.F.C., who was acting as observer, and the pilot, Sgt. E. Handley, R.F.A., were instantly killed.

They were at a height of about 5,000 ft., in the neighbourhood of Woodham, near Addlestone, when a loud explosion was heard. Flames were seen, and then the aeroplane dived headlong to earth. The engine was embedded nearly two feet in the ground.

Mr. Jordan belonged to Wembley. Sgt. Handley was one of the best pilots that Australia has produced.

It is stated that the mid-air fire, which was attributed to escaping petrol, apparently exhausted itself before the aeroplane struck the ground, for there was no flame amongst the wreckage, portions of which were scattered over the field in which the machine fell.

LARKIN.—A Warwickshire coroner held an inquest on August 20th on the body of 1st Air Mech. Sydney Edward Larkin, of Sydney, Australia, which followed a flying accident near Birmingham.

The pilot, Lt. Belcher, also an Australian, was flying with Larkin, and when about 500 ft. high they encountered a "bump" in a gust of wind. The machine nose-dived and crashed to earth. Mr. Belcher, who is still in hospital, was seriously injured. He has stated that if they had been higher they could have escaped the accident.

A verdict of accidental death was returned.

McCULLOUGH.—Sec. Lt. Alexander F. McCullough, R.F.C., was killed on August 16th by the fall of his machine.

MONTGOMERY.—Lt. Clark C. S. Montgomery, Canadian Infantry and R.F.C., who was killed while flying on August 14th, was the only surviving son of Robert Oliver Montgomery, Vancouver, B.C., formerly of Toronto. He was 22 years of age.

MUNRO.—Sec. Lt. Guy Horace Munro, Royal Fusiliers, attd. R.F.C., who was killed on August 18th whilst flying on home service, was the youngest son of Mr. and Mrs. C. F. Munro, of E. Twickenham. He was 24 years of age.

PHILLIPS.—Sec. Lt. R. Phillips, attd. R.F.C., a Canadian Officer, was killed on August 14th while flying over Lincolnshire, when his aeroplane was seen to fall to the ground, at Welby, near Grantham.

PILLOW.—Sec. Lt. Henry Montgomery Scott Pillow, R.F.C., was killed on Aug. 8th. He was born in March, 1895, and was the second son of Mrs. Pillow, Chief Examiner of the Government colleges for training teachers in cookery and domestic science and vice-chairman of the Public Service Board, and of the late Edward Pillow, for many years Education Secretary to the Norfolk County Council. He was educated at Norwich Grammar School, and was a student at Guy's Hospital. Within a month of the outbreak of war he joined the Public Schools Brigade, and shortly afterwards went on active service abroad as a private in the Royal Fusiliers. After seven months of service in the trenches he was sent home to train for a commission, and in due course he was gazetted to the Middlesex Regt., and later transferred to the R.F.C. After gaining the full qualifications, he went to the front on July 28th, and met his death within 10 days. His elder brother, now the only surviving child of Mrs. Pillow, is also an officer, and is serving abroad.

REINCKE.—Capt. L. F. Reincke (Leo), The Duke of Wellington's Regt., attd. R.F.C., who was killed in action on August 17th, was the son of Mr. and Mrs. L. Reincke, 5, Champion Park, Denmark Hill, S.E.5. He was 29 years of age.

ROWLANDS.—Lt. Rowlands, R.F.C., aged 22, made a flight over Lincolnshire on August 15th, and in landing his machine came into collision with a house. Mr. Rowlands, who came from the Liverpool district, was killed outright, his head being crushed by falling brickwork.

SOLLY.—Capt. Arthur Norbury Solly, R.F.C. (killed in action on August 11th), was twenty-three years of age, and the elder son of Mr. and Mrs. Ernest Solly, of Harrogate. He transferred from the New Armies to the R.F.C., and had his "wings" in March, 1916.

SWORDER.—Lt. Hubert Pelham Sworder, The Queen's (Royal West Surrey Regt.), attd. R.F.C., whose death was announced last week, was educated at Haileybury, where he was captain of the gymnastic six, and Sandhurst. He was a keen follower of hounds, and hunted with the Puckeridge Foxhounds and the Eastern Counties Otter Hounds.

He was made temporary captain some months ago, owing to his being brigade signalling officer, but relinquished this rank on joining the R.F.C. in August, 1916. He was only nineteen when killed.

VALENTINE.—Major James Valentine, D.S.O., R.F.C., whose death was recorded last week, was the only child of the late James Valentine, managing director of the Northern Assurance Company, Moorgate Street, and his mother was, before her marriage, Miss Fanny Roe, a member of an old Norwich family.

[Owing to a lamentable error on the part of the printers a paragraph in the appreciation of the deceased officer, written by one of his oldest friends, was made to appear devoid of sense. The paragraph should have been:—

"Later I stayed with him in Cheshire. Surely there never was on earth a greater incongruity than the association of Jimmy Valentine with his vivid driving and the old Georgian mansion sleeping nobly in a wooded park where his Fates had led him for a temporary residence! Here, too, his gaiety overcame the disapproval not unnaturally brought into being by the vehemence of his passage over the country roads."]

Engagements.

BARRY—JONES.—An engagement is announced between Lt. James Vincent Barry, R.F.C., second son of the late James Hewitt Barry, of Calcutta and London, and the late Mrs. Barry, of Hillbrow, Horsham, and Löis Vèra, only daughter of the late Harold Jones, M.I.C.E., and Mrs. Harold Jones, of 8a, Longridge Road, Earl's Court.

DICKINSION—WAUCHOPE.—The marriage arranged between Capt. C. J. Dickinson, R.F.C., and Janet Caroline Sutherland Wauchope will take place quietly in London on the 23rd inst.

GETHIN—STAPLEDON.—An engagement is announced between Major P. E. L. Gethin, R.F.C., youngest son of Sir Richard Gethin, Bart., and Lady Gethin, of The Grove, Hythe, Southampton, and Norah, elder daughter of Mr. and Mrs. I. N. Stapledon, of Knapp, East Anstey, Devon.

HAYNES—WALKER.—The engagement is announced of Capt. C. C. Haynes, Devonshire Regt. and R.F.C., eldest son of

"ASCOL" SERVICE!

DELIVERY FROM STOCK OF THE PART THAT HOLDS YOU UP!

SEND us a COMPLETE LIST of your requirements, and we will return this to you in course of post with the prices marked against those items we can supply FROM STOCK, or deliver quickly.

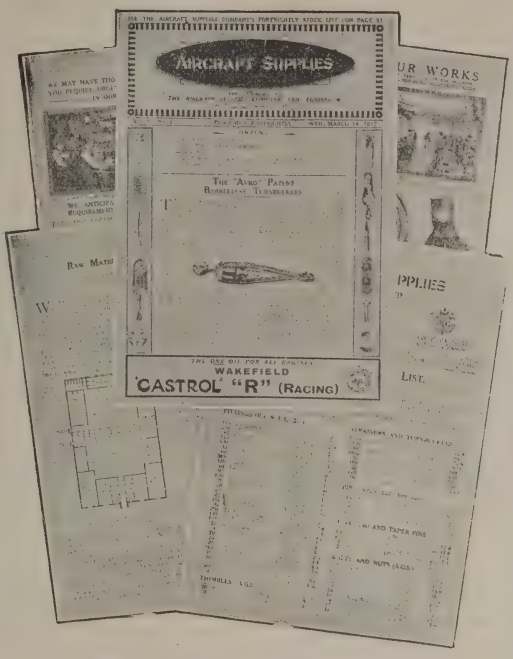
A.G.S. and STANDARD PARTS from STOCK.

SPECIAL AIRCRAF and ENGINE PARTS for EARLY DELIVERY.

FOR ILLUSTRATED STOCK AND QUOTATION LIST SEE

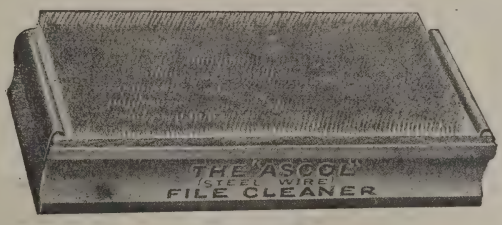
"AIRCRAFT SUPPLIES"

OUR FORTNIGHTLY HOUSE JOURNAL.



Vol. 2. No. 6.

Ready Thurs. Next—Aug. 30th.



PUBLISHED fortnightly, on alternate Thursday evenings, and issued FREE to the Air Services and to the Aircraft Industry (those in charge of Stores and other Works or Service Departments ONLY), on application to the Secretary.

CONTAINS a complete LIST OF STOCK of Aircraft Parts up to the time of going to press, CURRENT PRICES, details of NEW ITEMS, ENQUIRY BUREAU, and other A.S.C. announcements. A SHORT ARTICLE will also appear in each issue on a topic of interest to Aircraft Constructors.

STOCK LIST contains over 400 items.

A NEW "ASCOL" ITEM (Tool Dept.)

8/6 per doz.

Illustrated Leaflet on Application.

"The A.G.S. Book"

By BERNARD ISAAC.
130 Pages. Over 230 Illustrations.

AN IMPORTANT WORK of REFERENCE FOR THE AIRCRAFT INDUSTRY AND THE AIR SERVICES.

CONTENTS.

CHARTS of A.G.S. Rafwires, Tie Rods and Joints, Nuts, Bolts, etc., covering extracts from 82 blue prints—Metric Equivalent Charts—Numerical List of A.G.S. Parts — Alphabetical List of A.G.S. Parts—A.G.S. and other Screw Thread Systems—A.G.S. Standard for Bolt Heads and Nuts — Photographs, Drawings and Dimensions of all important A.G.S. Parts—A.G.S. Fits and Limits — Test Pieces — Articles on "Standardization of Aircraft Parts" and "Accelerating Aircraft Output"—Chart of Admiralty Strainers—Illustrations of R.A.F. and other Aircraft Parts, etc., etc., etc.

THE "A.G.S. BOOK" is issued to **approved applications** from the Air Services and the Aircraft Industry. Persons connected with the Aircraft Industry should make application through their firms. Applications from the Air Services should be made through the Commanding Officer. One copy is supplied **free** to each firm, and additional copies may be obtained at 2/6 each, the whole of the proceeds, without deduction, being given to The Royal Aero Club Flying Services Fund

APPLICATIONS must be made on the special forms which may be had from The Aircraft Supplies Co., Ltd., 166, PICCADILLY, LONDON, W.1.

IRONS—SMITH.—A marriage has been arranged, and will take place in November (leave permitting), between the Hon. Winifred Smith, daughter of Lord and Lady Colwyn, of Colwyn Bay, and Capt. T. R. Irons, R.F.C., son of Mr. and Mrs. T. Irons, of Sydney, Australia.

Marriages.

EASTLEY—WINTLE.—On July 6th, 1917, at the Cathedral, Bombay, Charles Mortimer Eastley, R.F.A. and R.F.C., eldest son of Mr. and Mrs. Charles H. Eastley, of Paignton, S. Devon, was married to Esmé Beryl Chester, elder daughter of the late Lt.-Col. E. de V. Wintle (12th Cavalry, F.A.) and Mrs. Wintle, of Gulmarg, Kashmir.

GOULD—MOCKRIDGE.—On Aug. 11th, at the Parish Church, Pyrford, Surrey, Capt. Robert Gordon Gould, M.C., R.F.C., eldest son of Mr. Robert Gould and Mrs. Gould, Pinecroft, Pyrford, was married to Margaret, second daughter of Mr. Whitney Mockridge and Mrs. Mockridge, of Pine Lodge, West Byfleet, Surrey, by the Rev. Cuthbert Hamilton.

RANDALL—CAREW-ROBINSON.—On August 18th, at St. Peter's, Eaton Square, Gerald Frayne Randall, R.F.C., only son of the Rev. H. L. Randall, Rector of Cockling, Sussex, and Mrs. Randall, was married to Barbara, only daughter of Mr. and Mrs. C. Carew-Robinson, of 27, Ashley Gardens, S.W., and Bepton, Midhurst, by the Rev. Stuart Clark, Vicar of Tonbridge, assisted by the Rev. Basil Phillips, Vicar of Farnborough.

Births.

CALEY.—On August 17th, at Doone Cottage, Addlestone, Surrey, the wife of Sec. Lt. Arthur Henry Caley, R.F.C.—a son.

CURTIS.—On August 15th, 1917, at The Grove, Stutton, Ipswich, the wife of Lt. J. S. Curtis, R.F.C., of a son, still-born.

MACLEAN.—On August 18th, at Littlecott, Enford, Wilts, the wife of Lt.-Col. A. C. H. MacLean, The Royal Scots and R.F.C., a son.

ROMANES.—On the 18th inst., at Broompark, Helensburgh, the wife of Capt. J. Romanes, R.F.C., a son.

STUART BLACK.—On August 12th, at "Llangors," Wolsey Road, East Molesey, Surrey, the wife of Sec. Lt. J. Stuart Black, R.F.C., late of the Middlesex Regt., of a daughter.

FRANCE.

Official Communiqués.

August 16th.—Our aviators copiously bombarded last night and this morning the enemy bivouacs and cantonments to the north and east of Houthulst Forest (south-east of Dixmude), as well as Lichtervelde railway station (12 miles east of Dixmude).

In the course of our attack in the Ailles-Hurtebise (Aisne) sector our aeroplanes, undeterred by the bad weather from flying very low, accompanied the advance of our infantry and at a low altitude attacked with machine-guns the enemy's shelters and reserves.

Army of the Orient.—Twenty-three French and five Italian aeroplanes have bombed the enemy camps in the region of Pogradec (south of Lake Ochrida), while British aviators bombed the depots in the region of Seres (Struma front).

August 17th.—Our aeroplanes have taken an active part in the operations on the Belgian front. They engaged in numerous combats with enemy aeroplanes, two of which were brought down and two compelled to alight in their lines.

Furthermore, while flying at a very low altitude, they attacked successfully with bomb and machine-gun enemy troops, railway trains, and aviation grounds.

Two German aeroplanes have been brought down by the fire of our special guns.

August 18th.—German aeroplanes bombarded the region north of Nancy. There were no victims.

During the day of August 17th and the night of August 17th-18th our bombarding aeroplanes carried out many flights over the enemy's lines. One hundred and eleven of our machines took part in various flights, in the course of which 13,000 kilograms of projectiles were dropped on the enemy's establishments. Two of our machines have not returned.

The aviation grounds of Colmar, Frescati, and Habsheim (just east of Mulhouse), the aviation camp in the region of Chambley (14 miles south-west of Metz), the railway stations of Freiburg, in Breisgau, Longuyon (10 miles south-west of Longwy), Montmédy (19 miles west of Longwy), Pierrepont (seven miles south of Longwy), St. Juvin, Grand Pré, Challerange (all three south-west of Dun-sur-Meuse), and Dun-sur-Meuse, etc., and the bivouacs of the Spincourt Forest (about 17 miles north-east of Verdun) were copiously showered with projectiles. Many explosions on the objectives were observed, and several fires broke out.

During the night of August 16th-17th the railway station of Cortemarck (10 miles east of Dixmude) was also visited by our aircraft. A violent fire broke out in the railway station buildings.

During the day yesterday 7 German aeroplanes and a captive balloon were brought down by our pilots, and 8 other enemy machines fell in their lines gravely damaged.

Army of the Orient.—The British air forces bombarded enemy installations in the region of Demirhissar. The French air force bombarded those in the Resna region.

August 19th.—Our chasing aeroplanes were particularly active yesterday (the 18th). Eleven German machines fell in flames or were completely destroyed as the result of air engagements with our pilots. In addition 6 enemy machines were forced to land in their own lines seriously damaged.

During the night of the 17th-18th and in the daytime yesterday (the 18th) our aeroplanes bombarded the railway stations of Cortemarck, Thourout, Lichtervelde, Ostend, and Cambrai, the hutments in the Forest of Houthulst, the railway stations of Dun-sur-Meuse and the munition dumps at Bantheville (south-west of Dun). Fire broke out in the Cambrai station and in the establishment.

August 20th.—Our aviators played a brilliant part in the battle, firing with machine-guns on enemy gatherings from low altitudes and thus contributing to the repulse of the counter-attacks.

Our pilots brought down 11 German machines in front of the Army, and two other German aeroplanes were brought down by our special guns.

* * *

A report from Paris, dated August 17th, states that a Decree has been issued charging the Under Secretary of State for Military Aeronautics with the chief control of the Naval Air Services and with the establishment of a complete liaison with the air services of the Allies.

* * *

A report from Paris, dated August 14th, states that Capt. Guynemer has been appointed an Officer of the Legion of Honour in recognition of his services as a pilot. One of his most brilliant exploits was on May 25th, when, in one minute, he accounted for two enemy aeroplanes, and in the same flight had two more victories. Altogether he had brought down 45 machines.

GERMANY.

Official Communiqués.

August 14th.—In numerous aerial battles nine enemy aeroplanes and two captive balloons were shot down. On August 12th Ober-Lt. Dostler brought down his 23rd and 24th opponents.

Yesterday (August 12th) evening at 8 o'clock a hostile aeroplane dropped five bombs on Frankfurt-on-Main. Two men, one woman, and one child were killed, and 12 other persons were wounded. No damage of a military character was done. While returning the raider was brought down near Saargemünd (about 90 miles south-west of Frankfurt) by two of our aeroplanes, and the French occupants were made prisoners.

August 15th.—By their acuteness and ability the battle echelons of our aviators have developed themselves into a valuable arm of attack against trench and battery objectives.

In aerial battles, which were specially numerous in Flanders, and as a result of anti-aircraft fire, 20 enemy aviators and captive balloons were shot down yesterday.

August 17th.—Sixteen enemy aeroplanes were shot down. Baron von Richthofen has thereby gained his 58th and Ober-Lt. Dostler his 25th aerial victory.

August 18th.—By means of our aviators and anti-aircraft fire 26 enemy aeroplanes were brought down and also 4 captive balloons, the latter in flames. Senior Lt. Dostler gained his 26th, Actg. Officer (vice-sgt.-maj.) Müller his 22nd, and Lt. Gontermann, by the shooting down of two of the captive balloons, his 29th and 30th aerial victory.

August 19th.—Yesterday 19 aeroplanes and one captive balloon was shot down in aerial encounters. Chasing Squadron No. 11, for a long time conducted by Capt. von Richthofen, yesterday, after seven months of activity, brought down its 200th adversary. One hundred and twenty-one machines and 196 machine-guns have been captured by this echelon.

August 20th.—An enemy squadron of seven aeroplanes appeared over Freiburg on Friday afternoon between 12.30 and 1 o'clock and dropped several bombs. Four persons were injured and three buildings damaged, but no military damage was done. German battle aeroplanes shot down an enemy machine, which crashed to the ground.

Western Front.—Sixteen enemy aeroplanes and four captive balloons were brought down yesterday. Lieut. Gontermann shot down three captive balloons and one aeroplane, thereby increasing his aerial victories to 34. Acting Officer Vice-Sergeant Müller was victorious for the 23rd and 24th time in aerial engagements.

nounced the recent raids by French aviators, and declared that Frankfort was an undefended city.

A resolution urging the military authorities to make prompt reprisals was passed.

[How very English.—Ed.]

ITALY.

Official Communiqués.

August 14th.—In a combined action numerous batteries and a large flight bombarded on the afternoon of the 13th inst. the enemy's military works at Modrea and Modrejce (south of Tolmino) (Isonzo), damaging them severely and partly setting them on fire.

August 15th.—Yesterday morning one of our large bombardment flights, strongly escorted, reached the important railway centre at Assling, in the Sava Valley (south-east of Villach), with the object of damaging it and interrupting the intense traffic of the enemy there.

A second flight, not less powerful than the first, repeated the operation in the afternoon, having as its objective the steel works situated in the same locality.

The results which it was possible to observe proved very satisfactory.

Six and a half tons of explosive bombs of medium and large size, and also incendiary bombs, were dropped, and direct hits were obtained on some works, while other buildings, including the railway station, were set on fire.

All our aeroplanes, after having carried out this most daring operation (which was the more difficult on account of the distance to the centre bombarded) returned to their bases safely, passing through the screen of the enemy's fire, and repulsing in brisk air duels the numerous enemy machines risen to oppose them.

August 17th.—Yesterday afternoon one of our flights effectively bombed enemy encampments and military assembly centres east of Comen (15 miles east of Monfalcone). All our aeroplanes returned safely to their bases.

August 18th.—Flights of aeroplanes and airships are bombarding troops massed behind the enemy lines.

[This refers to the Italian offensive in the Tolmino district.]

August 19th.—In the morning one of our bombardment flights renewed the raid on the Comen (12 miles east of Monfalcone) military works with very effective results. All the aeroplanes returned safely to their bases.

August 20th.—The battle is proceeding on the Julian Alps front.

Altogether 208 aeroplanes indefatigably participated in the battle, attacking repeatedly with bombs and machine-guns the troops assembled to the rear of the enemy positions.

* * *

A message from Rome states that in mid-Adriatic on August 18th an Italian seaplane sank an enemy submarine by bombs, securing direct hits.

* * *

The following message from Rome, dated August 17th, is from the "Morning Post":—

During an Austrian aeroplane raid on Venice early on Tuesday morning Italian art suffered another disastrous loss. The enemy's bombs destroyed a portion of the wonderful ceiling of the civil hospital of SS. John and Paul, which was originally the Grand School of St. Mark. This ceiling was considered one of the largest, richest, and most ornate in Italy. It was originally made in the year 400 A.D., and was reconstructed in mediæval years after a fire which destroyed the school. Fortunately, sufficient of the ceiling is left intact to allow reconstruction on the original design and scale.

RUSSIA.

Official Communiqués.

August 14th.—German aeroplanes dropped bombs on the railway stations at Molodetchno and Siniavka.

August 16th.—During the night of August 14th our aviators made a flight over the Courland coast. The bombs they dropped caused conflagrations.

BELGIUM.

Official Communiqué.

August 14th.—In spite of the unfavourable weather yesterday, our artillery, energetically directed by our aviators, carried out successful destructive fire against the enemy artillery, which replied by shelling certain parts of our trenches and lines of communication in the Ramscappelle region with gas shells.

In spite of the barrages put up by enemy squadrons, our aviators went up on photographic distance flights behind the German positions.

August 17th.—Our aviators have been very active, having carried out 75 flights. One of our aviators yesterday brought down an enemy machine above the forest of Houthulst.

HOLLAND.

A report from Amsterdam states that the Germans committed a violation of Dutch neutrality on August 18th. German aeroplanes came down at Blyham and Beerta, small towns in Groningen Province, near the German frontier. That which descended at Blyham was on fire, and later its crew of three men were discovered uninjured. The aeroplane which came down at Beerta is said to have been hit by a bullet fired by a Dutch sergeant, which broke off part of the air-screw. These aeroplanes came from Ghent, and when above The Dollart (in the Ems estuary) they thought they had reached Germany. The number of the aeroplane which came down at Beerta was S.S.W. 1,055; it was also marked K.K.

* * *

A message from Zierikzee, says that a squadron of aeroplanes passed over the coast of the island at 11.30 a.m. on August 18th and threw three bombs, one of which fell on Moermond Castle, near Renesse, and another near Noordwelle, in an open field. Aerial torpedoes were also found in the district. No one was injured, but much damage was done. The aircraft went in the direction of Brouwershaven, on the north side of Schouwen.

* * *

A Goedereede (Goeree Island) telegram reports that at the same hour two aeroplanes of unknown nationality appeared above Stellendam, coming from the south-east and disappearing to the north-east. Six bombs were thrown just outside Goedereede.

U.S.A.

From the New York correspondent of the "Daily Chronicle," dated August 18th:—American Government experts, privately at work for months past, have devised an aeroplane engine which is more powerful than any at present in use.

While its peculiarities are necessarily a rigid secret at present, it is known that the engine has only been perfected after exhaustive experiment with every known type.

Parts can be standardised with ease, so that the manufacture of the machines may be carried out on an unprecedented scale.

[One sincerely hopes that the construction of this wonderful engine is as rigid as its secrecy, and that its weight is less notable than its power. The exhaustive nature of the experiments seem to suggest a curious hybrid if details have been borrowed from engines of every known type.—Ed.]

THE CURTISS CORRUPTION CHARGES.

Sir John Dickinson, at Bow Street, on August 17th, resumed the hearing of the case in which William Augustus Casson, aged 64, barrister and retired Civil Servant, of Bedford Road, Chiswick, and Wing Comdr. John Cyril Porte, R.N.A.S., are charged with having conspired together and with Lyman J. Seeley and other persons to contravene the provisions of the Prevention of Corruption Act, 1906. Comdr. Porte was again absent through illness, but was represented by Mr. R. D. Muir.

Mr. Arthur William Smallwood, Assistant Director of Contracts at the Admiralty, stated that prior to the war the Admiralty had no contracts with the Curtiss Company. The first contract, just after the commencement of the war, was for the purchase of the "America" and her sister flying boat. This was followed by various other contracts for aeroplanes, motors, spares, etc., respecting which contracts the witness proceeded to give the dates and other details.

Large remittances were made to America by the Admiralty in payment, the total of these amounting by December, 1915, to several millions of dollars. He could not say positively how these remittances were made—whether through the firm of Morgan or otherwise; the Accountant-General would be able to give particulars on that point. Remittances were made not only against goods actually delivered, but also in advance in respect of goods to be delivered thereafter.

In 1916 the whole position between the Admiralty and the Curtiss Company was embodied in a new contract, dated September 21st. At the same time the position of the London agency of the Curtiss Company was considered and dealt with. Witness had never seen Mr. Seeley, the London agent, personally on these matters, though some of the contracts had been negotiated through him, nor had he ever had any communications or interviews with Casson. It was only after Lt. Neilson's return from America in the autumn of 1916 that witness first heard any suggestions about commissions having been paid by the Curtiss Company to be afterwards divided between Mr. Casson and Comdr. Porte.

Mr. Muir: You have spoken of advances being made to the Curtiss Company before goods were delivered. Similar advances were being made, were they not, to other manufacturers in different parts of the world? Witness: Yes.

Mr. Muir: That was to enable them to increase their plant and accelerate the rate of production? Witness: Yes, and generally to enable them to fulfil their contracts.

The Attorney-General said he now proposed to put in as evidence the statements made by the defendants before the committee appointed by the then First Lord of the Admiralty and presided over by Mr. Butcher, K.C. This would be a convenient time for the Court to hear and decide on the objections which he understood counsel for the defence desired to make to the admission of those statements as evidence. The Attorney-General proceeded to state the grounds on which he maintained they ought to be admitted, and reviewed at length the legal decisions bearing on the point.

Mr. Muir submitted that the statement made to the Committee by Comdr. Porte ought not to be admitted in evidence against him, as it had not been proved that it was in any sense a voluntary statement, and in the absence of such proof it was not, according to certain precedents which he quoted, admissible. Even if it was held not to be strictly inadmissible in law, he contended that the magistrate in the exercise of his discretion ought to exclude it. So far from Comdr. Porte's statement to the Committee having been a voluntary one, he was practically under compulsion as a naval officer to attend the inquiry and answer questions, and, in fact, he had been examined as if he were a hostile witness and a person to whom suspicion attached.

Mr. Patrick Hastings followed on the same side, and pointed out that practically the only evidence against the two defendants was based on the answers extracted from them at the Committee of Inquiry in confidence and without any warning of their answers being subsequently used against themselves. Evidence obtained in such a way ought not to be admitted in support of criminal proceedings.

Sir A. Bodkin having replied for the Crown, Sir John Dickinson said he was clearly of opinion that the statements made by the defendant before the committee could be used in evidence, and therefore he must admit them.

Sir A. Bodkin: They are already before the Court in the form of exhibits, and there is no need to occupy time in reading them publicly.

Mr. E. T. Stainforth, a member of the Stock Exchange and partner in a firm carrying on business at Copthall Court, said that in 1915-16-17 his firm acted for Mr. Casson. Witness bought a number of securities for him, and by his instructions those securities were in many instances bought in the name of J. C. Porte. Witness also spoke as to a number of securities being transferred back from Comdr. Porte to Mr. Casson. The latter did not give him any explanation of the reason for such transfer.

Mr. E. More, manager of a stockbroking firm in Tokenhouse Yard, gave evidence as to buying for Mr. Casson, who was a client of the firm, 600 shares costing £2,385 15s. Of these, 300 were bought in Mr. Casson's own name and 300 in the name of J. C. Porte. There were subsequently other transactions of which witness produced a detailed account.

The hearing was again resumed at Bow Street Police Court on August 18th.

Sir Francis J. S. Hopwood said that in August, 1916, being then Additional Civil Lord of the Admiralty, he heard certain statements from Lieut. Neilson, R.N.V.R., in connection with the Curtiss Company. He then heard for the first time of Mr. Lyman J. Seeley. Shortly afterwards Mr. Seeley called on him, and in the course of conversation referred to his commissions from the Curtiss Company. Mr. Seeley said that originally there had been an arrangement between him and Mr. Curtiss, who had befriended him, under which he received a small salary, plus a commission of 1 per cent., but when, in consequence of the war, increased business seemed to be imminent, he had made certain fresh arrangements with Mr. Curtiss, under which his commission was increased by 15 per cent., making it 16 per cent. in all.

Witness understood from Mr. Seeley that that commission, putting it generally, was payable on all sales of the company's products in Great Britain, and witness thought in Europe also, with the exception of Russia. According to Mr. Seeley's account his position was that of sales agent, and the commission was payable to him as such. Mr. Seeley told him he had been in touch with the Air Department of the Admiralty from shortly after the outbreak of war.

Witness put it to Mr. Seeley that under the arrangement he had described he must have received a very considerable sum of money—that it must have run into six figures—and to that Mr. Seeley assented, but he said he had by no means drawn all the money, and was leaving much of it deposited in the United States. Witness thought that the Farmers' Trust and Loan Co. was mentioned as the agency through which amounts were remitted to Mr. Seeley from America.

Witness asked him if he had parted with any portion of his commission to other people, particularly to servants of the Crown, and he replied, "Most certainly not." Towards the end of the interview Seeley mentioned the name of Mr. Casson, who, he said, had had business relations with Mr. Curtiss and the Curtiss Company, and had made a claim on the latter for commission under some sales agreement. Mr. Seeley added that he had found it desirable, in his own interest, to enter into an agreement with Mr. Casson for the division of the 15 per cent. between them in equal shares—7½ per cent. to each. Nothing was said about what Mr. Casson had done to earn his share of the commission.

On October 30th, Mr. Casson called upon witness at the Admiralty in company with Mr. Seeley. In the course of the conversation on that occasion, Mr. Casson spoke of work he had done in connection with air enterprises, mentioning, he believed, the Blériot Company, and afterwards referred to the division of the 15 per cent. commission, and explained that he received his share of 7½ per cent. by virtue of the agreement existing between the Curtiss Company and Mr. Seeley. Witness suggested to Mr. Casson that the total commission must have amounted to over £100,000, and asked him if he had parted with any of his share of the money to any servant of the Crown, particularly Commander Porte, and he replied in the negative, saying most distinctly that no one but himself had any rights in the 7½ per cent. Mr. Casson mentioned that he knew Commander Porte and his affairs intimately, and was his family trustee.

Mr. Seeley was present throughout the interview, and did not dissent from anything Mr. Casson said, nor, on the other hand, did Mr. Casson dissent from anything Mr. Seeley said. Mr. Seeley tried to make a point of the commission being only 15 per cent., whereas in the trade the usual commission under sales agreements was 25 per cent. Mr. Seeley also said that Captain Elder, who represented the Admiralty in America, knew that the commissions were being paid.

In connection with the fact that when the Admiralty settled their new contract with the Curtiss Company a clause was inserted prohibiting the payment of any commissions, both Mr. Casson and Mr. Seeley appealed to witness to waive that prohibitive clause, and he was obliged to decline absolutely to do so.

Replying to Mr. Patrick Hastings, Sir Francis Hopwood said that Mr. Seeley with great candour offered to submit to the Admiralty any documents they might wish to see, and even to produce his bank pass-book. Mr. Casson was equally frank in offering to show any documents he possessed, except that he did not mention his pass-book.

Mr. Muir intimated that Comdr. Porte was so far improved in health that he hoped to be able to be present next week, as he was most anxious to be, to hear read over the evidence which had been given in his absence.

Sir A. Bodkin suggested that that course would be unnecessary, and that it might be obviated by Comdr. Porte being supplied with a copy of the depositions.

Sir John Dickinson agreed, and Mr. Muir accepted the proposal on the distinct understanding that his client should not be in any way prejudiced by being prevented from attending the court, which he was most anxious to do.

Several witnesses were briefly examined as to the banking accounts of Mr. Seeley, Mr. Casson, and Comdr. Porte at various banks, and Sir A. Bodkin said that closed the case for the prosecution.

Sir John Dickinson said Casson would be committed to take his trial at the Central Criminal Court, the same bail as before being accepted for his appearance. Mr. Hastings said he would reserve his defence.

A legal discussion ensued as to the course to be adopted in regard to Comdr. Porte, owing to his absence, Mr. Muir contending that he must either be committed for trial or have the summons against him dismissed, but eventually it was decided that the summons against him should stand adjourned, *sine die*.

MUNITIONS OR THE ARMY.

(From the "Morning Post," August 21st.)

At the London Munitions Tribunal on August 20th a tool machine foreman of a firm supplying gauges to the Ministry of Munitions unsuccessfully applied for a certificate of release, as he wished to accept a commission in the Royal Flying Corps as equipment officer to take charge of a workshop. He claimed that his skill and qualifications would make him of more service to the State in his new capacity, as the work would be more important.

The manager of the firm produced a communication from the Ministry of Munitions stating that in his present employment the man was doing as important work as it was possible for him to do, and that they had the utmost difficulty in obtaining skilled labour for their requirements. The manager also suggested that the Army had been guilty of an offence against the Defence of the Realm Regulations, as the man had been approached and tempted with the offer of a commission.

Applicant: I was not approached; it was purely voluntary. An officer asked me if I could recommend a man for a certain position, and after thinking the matter over I said that I would accept it.

The Chairman (Mr. Sherwood): If the Army has broken the Defence of the Realm Regulations, they can no doubt be dealt with. (Laughter.)

THE R.F.C. HOSPITAL FUND.

From the "Johannesburg Star" of July 12th:—

The hon. treasurer of the Johannesburg Ladies' Committee of the Royal Flying Corps' Hospital Fund (Mr. M. Honnet, P.O. Box 149, Johannesburg) acknowledges with thanks the receipt of the following sums:—Per Miss Buckland, proceeds of concert given by girls of Johannesburg High School, £10; Mrs. F. Mascall, £5; per Mr. Spicer, raffle of aeroplane, £7 11s.; per Mrs. McCubbin, £1 10s.; per Mrs. McCubbin, collected from tramwaymen, £1 17s. 6d.; American auction of needlework at Carlton Hotel on July 4th, £157 18s. 3d.; Mrs. R. Goldman, £5; Mrs. J. B. Mackinlay, Doreen, Stanley and Louis Norton, £1 10s.; S. Sondheim, £10; C. L. R., 10s.; Martha Washington Club, £25—£255 16s. 9d. Per Mayoress of Kroonstad (local collection), £13 3s. 6d.; per Mayoress of Bethlehem (street collection), £19 9s.; per Mayoress of Cradock (street collection), £40 17s. 1d.; per Mayoress of Port Elizabeth (street collection), £97 3s. 2d.; per Mr. James B. Cox, Eshowe and District War Relief Committee, £10—£406 9s. 6d.; Johannesburg (street collection*), £768 3s. 6d. Total to date, £1,174 13s.

* Note.—Of the amount collected in Johannesburg £6 19s. 2d. was collected on the Robinson Mine by Mrs. Bryant, and £6 17s. on the Crown Mines by Miss MacIntosh.

[Congratulations to South Africa.—Ed.]

AIRCRAFT IN THE HOUSE.

On August 14th **Mr. Pemberton-Billing** (Hertford, Ind.) asked the Leader of the House whether the Government had any power to insist on a system of warning against air raids being introduced in any given town in England, or whether the matter was left entirely to the local authorities; whether the casualties at Southend could have been avoided had warning been given; whether the authorities had half an hour in which to give warning and no warning was given; and whether the Government would insist under the Defence of the Realm Act that in certain towns a system of warning should be introduced.

The Chancellor of the Exchequer: I really cannot say what the powers are, but I shall discuss the matter with the Home Secretary.

* * *

On August 17th **Sir G. Cave** (Kingston, U.), answering **Mr. Pemberton-Billing**, said:—The issue of any public warning outside the Metropolitan Police District must generally be left to the local authorities, who know the local circumstances and the

wishes of the inhabitants; but the Home Office will be glad on application to give any advice or assistance which may be desired.

Replying to another question, he said:—The warnings by sound signal are intended for air raids by day only, i.e., between half an hour before sunrise and half an hour after sunset. Should an air raid occur during the hours of darkness, between half an hour after sunset and midnight, when there is less real danger than by day but much greater risk of a false alarm, the sound signals will not be fired, as they would unnecessarily disturb persons already under cover, but the police will circulate through the streets carrying the "Take Cover" placards, so that pedestrians may seek cover.

AN ENLIGHTENING GLIMPSE.

Mr. C. E. W. Bean, writing from British Headquarters on August 6th, of the Australian Artillery in the Ypres battle, says:—

Limbers had just been moved off and the guns got into position when, whirr! overhead a German aeroplane, flying under low clouds, wheeled over them. They could see the pilot in his seat and the bombs as he dropped them one after another over the batteries. But his journey was too hurried for aiming. Every bomb fell wide. He then turned to his machine-gun. Six times during the day German machines, amongst the whirling collection which circled low overhead, fired on these gun crews with machine-guns. The Australians rigged up a Lewis gun which they found in a crater and a Vickers gun left in a trench. These (with batmen, signallers, and spare men using rifles) were turned on to attack the planes whilst the battery continued its work.

Through all this, and under heavier shell-fire as the day went on, the Australian batteries carried out every order which reached them through a long day, exactly as if on a practice ground. "I had rather have lived those first six hours," said one to me, "than any other day of my life."

[From which one judges that the German aeroplanes were not confined by fear to their own side of the lines, as our officially doped Press would have us believe.—Ed.]

WHITEHEAD AIRCRAFT SPORTS.

The athletic sports meeting of the Whitehead Aircraft Co., Ltd., duly took place on Saturday last at the company's grounds at Feltham, and proved a great success, several thousand spectators being present, amongst whom were some three thousand of the company's employees. All events were, of course, confined to them, but, as athletic performances, their quality was well above the average, A. Northover, the winner of the 100 yards championship, showing himself to be an exceptional sprinter, with much staying power as well, for he also won the 440 yards handicap in the easiest fashion by some 50 yards.

The Ladies' Race (60 yards) was won by Miss A. Drew; the Richmond team beat Hanworth in the departmental tug-of-war; Sopwith's beat Whitehead's in another tug-of-war; and Captain Prior obliged with a clever and much admired exhibition of trick flying.

PUBLICITY.

Mr. A. J. M. Gray, who is well known as one of the most brilliant writers in the motoring press, and who has had vast experience of advertising in all its branches, has recently entered into partnership with Mr. E. H. Morris, and has started a publicity agency known as "The Gray Company," at 5, King's Street, W.C.2. The firm has an excellent connection among motor manufacturers, for many of whom the partners have done advertising service and consulting work in the past. The firm propose to undertake the buying of space and advertisements for manufacturers, and those with any knowledge of the partners will be prepared to vouch for the high quality of the work which they will do.

ON STANDARDISATION AND QUANTITY PRODUCTION.

Presumably all are agreed that the great need of the moment, aeronautically at any rate, is more and more aeroplanes. Those officially responsible for the Flying Services and the variously assorted critics of the Flying Services are at one on that point at any rate. As to how these multitudinous aeroplanes are to be produced is another question, on which there are as many opinions as there are men to hold them. Obviously the main road to procuring them is along the line of standardisation.

Therefore it is as well to have a clear understanding of what standardisation implies, for, like the blessed word Mesopotamia, standardisation appears to be to some people a consolation in all their afflictions. But standardisation is a thing which needs to be carefully handled, or it may become like unto the inspired schoolboy's definition of a lie, "An abomination before the Lord, but a very pleasing help in time of trouble." That is to say, standardisation as such may hold up output and result in obsolete aeroplanes being used on active service, and at the same time provide officials with an excuse for every kind of delay when taxed with their sins.

In other words, it is possible to have perfect standardisation without quantity production. On the other hand, it is impossible to have quantity production without standardisation, especially when quantities of the same thing are produced from a number of different sources.

A Revolutionary Publication.

It will be remembered that last week a paragraph was published in this paper, asking any firm which was in a position to render assistance in the production of aero-engines, or aero-engine parts, to communicate with "the Controller of Aeronautical Supplies, Room 355, Air Board Office, Strand, W.C.2." It is earnestly to be hoped that any reader of this paper who owns, or knows of, any workshop capable of turning out engine parts, and not already full up with war work, has already communicated the information to Room 355, and that if he, or she, has not already done so, the information shall be sent forthwith, on seeing this reminder.

I have no inside information as to this request by the Air Board, but on the face of it there seems to be, in the sending out of the notice, the excellent intention to adopt at last the *système globale* which has long been so successfully used in France for quantity production.

The Système Globale.

This system is in essence practically the same as that which existed in Coventry in the palmy days of the watch trade before automatic machinery killed individual enterprises. In those days every watchmaker had his own little workshop, and his whole family worked in it. He sent to the chief factory at regular intervals for his raw material, sheet metal for cases, rod, wire, blanks for gear wheels, strip for springs, and so forth, and worked them up into the particular part which was his speciality. In some cases these finished parts, after being delivered to the employer, were made up into sets and served out again to other individual workers, who took them home and assembled them into complete "movements," which were again returned to the employer in whose factory they were fitted into their cases, and tuned up, for sale, as a rule, to big London firms, who resold them as their own products at enormous prices.

Now naturally every part of those watches had to be standardised to a very fine pitch, finer by a good deal than A.I.D. limits on aircraft parts. But in those days the artist-artisan still existed to some extent, and the individual worker took a pride in his work, consequently fine standardisation was not difficult.

The industry was eventually killed by the importation of cheap French and American watches made from parts chewed out by the million on automatic machines. The Coventry watchmakers—with a few notable exceptions—were too conservative to adopt automatic machinery, and the workmen were too obstinate to consent to new organisation of output, and so most of the trade left the district. But the system itself was not to blame, for it only needed extending and modifying to suit new conditions.

The wool and linen industries were examples of the same system, wherein the hand-loom workers received their raw material from the central factory, and returned the manufactured article. In France the system existed largely in the motor trade at the outbreak of war. One would find, for example, a whole family employed in making carburettor floats. Mamma kept the accounts of material in, finished floats out, and wages in. Little Pierre chopped up the copper sheet roughly to the right size, little Jeanette cleaned it up nicely for soldering, big Jean bent it or pressed it to shape, and Papa performed the delicate operation of soldering up to precisely the correct standardised size and weight. There again you had standardisation and quantity production going hand in hand.

Ancient History.

It may remembered that over two years ago—on June 16th, 1915, to be exact—something very like this system was advocated in this paper as a means of increasing aircraft output. Naturally it was not suggested that every family should make little bits of aeroplanes, but it was suggested that the innumerable small engineering and motor firms sprinkled all over the country should be set to work to make aeroplane parts, drawing their material from central depôts in their dis-

tricts and delivering the finished parts to the same depôts, for distribution thence to the firms for whose aeroplanes or engines the parts were designed.

The system was then discussed in some detail, and if it had then been adopted our output would have increased very materially. Now, however, circumstances have altered considerably. Many of those little workshops have closed down, because they were despised as production units and could get no orders for Government work. In some cases workshops which really could have done good work, and offered to do it, were inspected by young gentlemen without factory experience, and turned down because they did not possess the kind of machinery these youngsters had been taught to regard as essential. In many cases the middle-aged men in such shops were called up for military service and turned onto less useful work.

I happen to know of one such small shop which was doing quite decent work on fuse-caps, and might equally well have made valve-caps or valves for engines. It was run by an old mechanic, a real artist as a turner, and a couple of youths. It closed down for lack of orders, and the last I heard of my friend the mechanic was that he was driving a motor lorry—a job on which he was absolutely wasted. Doubtless hundreds of similar cases could be found.

Present Possibilities.

Probably, therefore, these small shops are not now available. Nevertheless, there must be a large number of bigger establishments now at work on non-essential work, or on less essential work, which could be turned onto make engine and aeroplane parts, and one hopes that all will be roped in for the purpose. Practically any shop possessing a few lathes can help in the work of turning small parts, even if only in roughing out from the bar or from stamping, thus leaving the actual engine-maker's skilled men free to turn out greater quantities of finer work.

Similarly any shop where sheet-metal work is done—anything from art-metal work, as it is called, to making pots and pans—can be utilised for producing what the Aircraft Industry calls tin-clips.

The Difficulties.

The great difficulty is the proper organisation of the district depôts for raw material and for the redistribution of finished or partly finished parts. If any attempt is made to centralise all this work at the Hotel Cecil, or even in London, hopeless delay and confusion is bound to follow. Each district should have its own depôt, as an independent water-tight compartment, which would merely furnish its returns at regular intervals to the proper department in the Air Board. This would be in strict accordance with that system of decentralisation which is the only successful system in this country. Also, it is essential that the men in charge of these depôts should be accustomed to similar work. It would be no use making these jobs mere cushy things for invalided officers without business experience.

Essential Experience.

As I suggested in that article in 1915, the depôts should be run by men borrowed from such firms as Selfridge's, Harrod's, and the big Stores generally. In a place like Birmingham, for example, one would take a few men from one of those great furnishing firms in Corporation Street, where they are used to dealing in hardware from and to numerous small workshops and branch shops.

Old men with experience in this line would do the work perfectly, and the Services could afford to pay them well. And the whole system should be placed under the command of a young and energetic man who has already made his mark as a successful shopkeeper. If properly organised, the system may be made an immense success in augmenting quantity production, but if it is once allowed to be tangled up in centralisation it will cause infinite waste and delay.

A New Danger.

Above all, it is necessary that this modified *système globale*, organised to deal with quantity production of parts from small firms or ancillary firms, should not be allowed to interfere with the work of big firms who produce complete engines or aeroplanes, or other complete articles of aircraft equipment. Under this system it would be necessary for the minor firms employed to become practically wage-earners only, without power to buy or sell except from or to the Aeronautical Supplies Depôts. But it is most important that the big "complete article" manufacturers should not be tied down by any centralised system of buying.

Already one hears of dangerous delay in output caused by this, that, or the other department assuming control of certain essential commodities, and insisting on setting itself up as a kind of commission agent—without financial interests, of course—between the producer of the material and the manufacturer of the aeroplane. Timber has been "controlled" till the situation has become very serious indeed. The control of fabric has caused continual friction and delay and dissatisfaction all round. The official handling of the dope question, from the early quarrels over poisonous dope, and the use of various doping systems, to the control and allocation of materials for the manufacture of dope, has equally caused delay in production and annoyance to everyone concerned.

If we are to get the best results, it will be far better to put full responsibility for supplies and workmanship on the big firms whose position and experience fits them to take such responsibility, and judge them by results on the finished article. The various and multitudinous supply departments under the Air Board should be made to understand that they exist to assist and encourage quantity production and not merely to control supplies.

The mere word control has come to connote hindrance to progress. To control a horse implies keeping him under restraint. One loosens the reins when one desires extra speed or power output, and a very decided loosening of the reins is desirable if the Aircraft Industry is to put forth its maximum quantity production.

Standardisation as a Hindrance.

It may be well, at this point, to indicate how standardisation may become a hindrance to quantity production. To state a case briefly, one may standardise the manufacture of a jigsaw puzzle, each mis-shapen piece of the picture being stamped out mechanically so that it is exactly like the same piece in every other similar picture, but if one wants to produce that picture in the quickest and simplest way it is better to print it in one block.

Similarly one may standardise each and every part of a complicated aeroplane or engine to the last ten-thousandth of an inch, so that every part fits into its place perfectly, and yet the resulting machine may cost many times as much to produce in time and material and labour as it would cost to produce an equally efficient machine with fewer parts which were specially designed for quantity production.

For example, among the chief objections to all our officially designed aeroplanes have always been the facts that the parts have been difficult to make, so producing an undue proportion of "scrap" and consequent waste

of time and material, and that the design of the parts might easily have been simplified by anyone with experience of quantity production. These objections were constantly raised by manufacturers in the earliest days of the B.E.2c and the F.Es., and I gather that the R.Es. and S.Es. of to-day also contain unnecessarily complicated detail design.

All those complicated parts were beautifully standardised, in so far as each particular part came out exactly interchangeable with like parts, but the point was that the whole design might have been simplified so that the job of putting the machines together could have been done more quickly, and each part could have been simplified so that it by itself could have been made more quickly.

A Telling Caricature.

One designer, amazed by the official genius shown in giving intricacy to quite simple things, said to me one day that he believed that when the general design of an R.A.F. machine was done, it was brought into the main drawing-office, where the whole staff of draughtsmen fell upon it like a pack of wolves. Each draughtsman then seized a piece of detail design for himself, and carried it off to his own corner, where he spent the next month in twisting it about and mangling it till he had produced the most complicated possible piece of work, just to show how clever he could be.

That, of course, is a libellous piece of caricature, but it certainly did seem fairly evident that the detail design of the R.A.F. machines was done without any view to quantity production in the light of workshop practice and manufacturing experience. And, naturally, workshop practice plus manufacturing experience are most important factors in designing aeroplanes and engines, either for war or commercial purposes.

Speed and Cheapness.

In war-time rapidity of output is just as important as is cheapness of output in commercial production. It is generally admitted that our best designs at any moment during the war have been six months ahead of the best enemy designs. It is even more important that our quantity production should be six months ahead of the enemy's, so that the majority of our active-service pilots may be better mounted than the majority of enemy pilots. There is no sense in having one or two of our star-turn fighters out at the front on experimental machines which can fly rings round the best Germans, if the bulk of our reconnaissance and bombing and artillery observation pilots are on machines which are very considerably out of date. That has been the case too often in the past, and the fact that great improvements have taken place of late months is no excuse for what has been in the past, nor is it any guarantee for the future, unless things that are known to be wrong are put right. It is unfortunate, from the official point of view, that improvements have always come after and not before public agitations. *Post hoc* is ever difficult to distinguish from *propter hoc*.

Type Standardisation.

One very favourite idea among those who are agitating for quantity production is that vast improvements may be effected by standardising on a few types of aeroplanes on active service. It is, of course, absolutely true that if we could afford to scrap all types of aeroplanes and engines except three or four of each, and could turn our whole energies onto producing those types, we should materially increase our output, and should at the same time simplify the work of supplying squadrons in the field with spares. But type standard-

isation is a most dangerous game to play with such immature products as aeroplanes and aero-engines.

If aircraft were anywhere near their ultimate stage of development it would be highly advisable to standardise, say, four types of machine—a small fast single-seat fighter; a bigger two-seat fighter; a general-purpose machine for reconnaissance, artillery observation, photography, and what one might perhaps call tactical or corps squadron bombing; and for the fourth type a very big, multiple-engined, self-protecting, long-range bombing machine, to operate in large fleets on purely strategic or political bomb-raids.

The German System.

To some extent the Germans are doing this, which is perhaps why so many Service people are inclined to do likewise. For example, the Albatros DIII type, commonly known as the "V strut" single-seater, is almost the only chaser type seen on the West front. Fokkers, Halberstadts, Rolands, and so forth are scarcely ever seen, except in the minor war areas. It is said, in fact, that the V strut Albatros constitutes something like 80 per cent. of all German machines in the West. The Gotha, except for a few A.E.Gs., seems to have a monopoly of the twin-engine bomber class. But the two-seater "general purpose" class is fairly cut up between Albatroses, Aviatiks, Rumplers, D.F.W.-Aviatiks, L.V.Gs., and the bigger Rolands, with the three first-named apparently the most numerous.

Obviously if all the chaser squadrons are on V strutters, it must simplify immensely the handling and equipment of those squadrons in the field. And similarly the "Bucharest" squadron of Gothas in Flanders must be easier to supply with spares so long as every machine is exactly like every other. But, all the same, type standardisation can be overdone.

A Diversity of Creatures.

A friend of mine, an ardent supporter of standarisation, told me with horror, the other day, that he was informed—whether rightly or wrongly I do not care to say—that we were then using something like twenty different types of machines on active service. Probably we are. If so, at least ten of them are out of date, and their continued use is an excellent proof of our wrong-headedness in the past. And if there are another dozen more or less up-to-date types in use, it is no more than there ought to be.

The consolation about having a variety of types is that, if the responsible authorities make a mistake over one type, other types exist which pull them through till the mistake has been put right. We made a mistake in trying to standardise on the B.E.2c., and the R.F.C. was saved by a weird assortment of French and British "trade" aeroplanes rushed through in a hurry. We made a mistake in standardising on the R.Es., and the authorities were then saved by de Havillands and Bristols and Sopwiths. We made a mistake in standardising on R.A.F. engines, both air-cooled and water-cooled, and the authorities have been saved by Clergêts and le Rhônes and Rolls-Royces and Hispano-Suizas—thanks to the Navy and not to the R.F.C. of the period when the mistake was made.

Stagnation of Design.

But let any experienced R.F.C. pilot try to imagine the state of affairs to-day if the authorities had been permitted to standardise solely on B.Es., F.Es., R.Es., and S.Es. as its four types, with R.A.F. engines and nothing else. And there is every reason to believe that such standardisation would have been put through but for continual agitation at the period, and constant criticism of officially designed aeroplanes and engines.

Also, it is well to remember that if those types had been standardised there would have been no new and improved types constantly coming along as there are to-day, simply because all incentive to design new types would have been smothered. The result would have been stagnation of design, and disaster to the R.F.C.

Trying Out.
